THE growth of the cycling trade, and other industries in which rubber is used, has caused a great increase in the demand for rubber. That the price has not correspondingly increased is chiefly due to the discovery in West Africa

of a new rubber-yielding tree, *Kickxia africana*. The collection of rubber from wild trees is carried on in a reckless manner, and the trees are being gradually exterminated. The rubber collectors have thus to go further and further inland every year for their supplies, and the cost of the rubber is thus increased by the difficulties of transport. There seems therefore a likelihood that the planting of the best kinds of rubber may prove a profitable industry.

The World's annual consumption of rubber is now over 100,000,000 lb., worth more than £10,000,000 sterling. Of this, from one-third to one-half comes from Para, which exported in 1895, 45,788,613 lb.

There are many trees which yield rubber in different parts of the World. Most of them, however, are unsuited for cultivation for various seasons: some are climbers requiring large trees as supports, some yield very little rubber or rubber of poor quality, and others do not yield rubber until they are twenty-five or more years old. The chief kinds likely to be useful in cultivation are Ceara rubber (*Manihot Glaziovii*), Panama rubber (*Castilloa elastica*), Para rubber (*Hevea brasiliensis*), and perhaps African or Lagos rubber (*Kickxia africana*).

The cultivation of Ceara rubber was energetically taken up in Ceylon about twelve or fourteen

years ago, but the returns were found unsatisfactory, although the plant grew very well indeed. There are but few trees now in cultivation. Panama rubber is also scarce in Ceylon, and has not given very satisfactory results. The only important rubber at the moment is the Para kind, which alone is dealt with in the remainder of this Circular. This tree is well-suited to the climate of the low-country in the south-west of Ceylon, is readily cultivated, and gives a fair yield of rubber. Para rubber is the best quality upon the market, and obtains the highest and most uniform prices.

The town of Para occupies a position near the mouth of one of the vast embouchures of the Amazons, in about south latitude 1°, but the district of the same name extends over a vast forest region to the south and west, throughout which, and the enormous forests of Central and Northern Brazil, *Hevea brasiliensis* and allied species are abundantly found. The climate is remarkable for its uniformity of temperature, usually not exceeding 87°F. at midday, or below, 74° at night. The greatest heat recorded is 95°, and the mean for the year is 81°. The rainfall occurs principally during the months from January to June, the maximum being in April, when it reaches 15 in. For the remaining six months of the year very little falls, but there are fine days in the wet season, and occasional showers in the dry. The whole country is covered with dense, moist forests, and the soil near the numerous and gigantic rivers is deep, heavy, and very fertile. During the wet season much of the low-lying country near the Amazons' mouth is flooded. In the *gapos* near Para, visited by Mr. Cross, he found a flat district only three or four feet above the highest tides, and completely intersected with water-courses at low tide, filled with a soft, rich mud. The forest here, in which caoutchouc

collecting was vigorously carried on, was 80 or 100 ft. high and very damp and unhealthy, the soil full of moisture and very rich and fertile. The young plants, however, were not often observed to grow actually within the reach of the tides, but it is evident that they must frequently be subject to be partially covered with water.—TRIMEN, *Notes on Rubber-yielding Plants.*

Para rubber was introduced into Ceylon in 1876, when the young plants obtained from Brazil at the expense of the Indian Government were planted in Henaratgoda Garden. These are now very fine trees, with an average height of about 60 ft., and average girth at 6 ft. above the ground of 4 ft. From their seed other plantations have been made in the Botanic Gardens, and also by the Forest Department. A large quantity of seed has been sold to private planters since 1886. There are about 450 trees in the Botanic Gardens, producing about 100,000 seeds per annum.

The number of trees on private estates in Ceylon is probably about 200,000, of various ages from one to twelve years. This number represents an area of about 750 acres.

CLIMATE.—From the description of the climate of Para quoted above, it will at once be evident that only the wet, low-lying country in the south-west of Ceylon is suitable for the growth of *Hevea*. The best climate is probably that of the country lying between Kalutara and Ratnapura. Whilst the tree will grow at Peradeniya, (elevation 1,576 ft.) it suffers much from cold, and grows very much more slowly than in the low-country. Probably about 550 ft. or 600 ft. will be found to be the maximum elevation for successful culture. The tree is quite unsuited for cultivation in the dry regions of the Island.

SOIL.—In its native country *Hevea* is a jungle tree usually growing in deep, rich, alluvial soil which is liable to be flooded during the wet seasons. The earliest plantations made in Ceylon were therefore made on low-lying land subject to floods. It was found that if the plants were well grown up, flooding did them no harm, whereas it was fatal to seedlings or very young plants. It would seem, therefore, that what the plants really require is a damp soil, and this has been borne out by local experience. The immense level area of the Amazon valley tends to prevent floods of any great depth, whereas in Ceylon the valleys are narrower, and the water may easily rise several feet. Land liable to frequent flooding should therefore be avoided.

Chena land has been tried at Edangoda, but the result has been unsatisfactory; sandy soil also has been found unfavourable to the growth of *Hevea*, and the tree also grows badly where exposed to much wind.

It would appear therefore that the most suitable soil and situation for this tree is fairly flat land, at about sea level, with good alluvial soil, preferably jungle land, and not sandy. The land should not be subject to frequent floods or strong winds.

The area of land in Ceylon suitable for profitable rubber cultivation is thus comparatively small, possibly not more than 10,000 acres, but, on the other hand, this cultivation need not interfere with that of coconuts.

CULTIVATION.—*Hevea* forms a moderately tall tree, not very much branched. It begins to flower at about six years old, but for planting purposes the seed of more mature trees (twelve or more years old) is preferable.

About February, in Ceylon, the leaves mostly turn brown and drop off, and the flowers soon afterwards appear. They are followed by large woody fruits, each containing three seeds, which ripen in July and August. The fruits open explosively, usually in the hot part of the day, and scatter the seeds to some distance. The seed is very large, weighing about half an ounce. It has a hard seed coat, and the interior substance is very oily.

The seed soon loses its power of germination, and ought to be sown within a week of its falling from the tree. If it has to be sent on a voyage of more than a week, it should be very carefully packed in charcoal. Even thus, however, the majority of the seeds soon die, and the only satisfactory way of sending seeds to distant countries is to plant them in soil in a Wardian case and allow them to grow on the way.

The germination of the seed is very rapid, and a long tap root is soon produced. The seed should be sown about an inch deep in well prepared soil, in nurseries, or, if preferred, in bamboo pots or baskets. They should be kept shaded and watered, and when the young plants are from 18 in. to 24 in. high they may be planted out. Good results are also obtained by stumping, the plants being allowed to grow about 3 ft. high, then taken up, and the main root cut across about a foot below the ground; but the method of planting out the smaller seedlings is perhaps preferable.

The plant may also be propagated by cuttings. The method employed in the Botanic Gardens has usually been to take cuttings near the ends of the branches, but further back than any of the leaves. Each cutting is about a foot long, and as thick as a lead pencil, and is cut off at both ends by oblique cuts made just below leaf scars. The cuttings are planted in nurseries in wet earth. This method is somewhat precarious: sometimes nearly all the cuttings grow, at other times only a small proportion.

The seedlings, stumps, or cuttings should be planted out during rainy weather in prepared places. Holes should be dug as in the case of cacao, and filled with good soil. A little manure will often be advantageous. The young plants require to be lightly shaded for a time until they are established, and probably for the first two or three years they will grow the better for a certain amount of shade, such as would be given by narrow belts of trees running through the plantation. These belts should be arranged to act as wind belts, as the *Hevea* is easily injured by wind. By the time the trees are about three years old they will have grown up to a height of about 25 ft. or 30 ft. and form their own shade.

Various distances apart have been tried in planting *Hevea*. The younger plantation at Henaratgoda Garden has the trees planted 12 ft. apart. Their average girth is now about 30 in., and they require thinning. It will not do, however, to conclude from this, as is sometimes done, that the trees should be originally planted more than 12 ft. apart. On the contrary, the best results have been obtained by planting 8 or 10 ft. apart each way. The trees thus form their own shade and keep down weeds, and a process of natural selection of the best trees goes on, and the more weakly and dwarfed trees may be gradually thinned out in subsequent years. Another advantage of close planting is that the trees grow up straight without forming many branches low down, and this very greatly facilitates tapping,

Para rubber is a surface-feeding tree, and catch crops should not therefore be grown between the trees, which require all the nourishment that the soil can afford.

The young plants are greedily eaten by cattle, deer, hares, and other animals, and require careful protection for about eighteen months, after which time they are generally tall enough to require but little further protection.

Weeding is also required for the first year or two, but afterwards the trees form a dense shade, under which but few weeds grow.

The comparatively superficial growth of the roots renders manuring easy, and it would probably be found advantageous in poor or sandy soils.

RATE OF GROWTH.—The tree grows very rapidly in height. The original trees, planted at Henaratgoda in 1876, were about 30 ft. high and 14 in. in girth two years later. In 1882 the largest tree was 50 ft. high and 25 in. in girth at a yard from the ground. The girth of this largest tree was taken annually after this, with the following results. It was 30 in. in 1883, 36 in 1884, 43 in 1885, 49 in 1886, 53½ in 1887, 60 in 1888, 65 in 1889, 69¾ in 1890, 73 in 1891, and 79½ in 1893. The girth of the largest tree measured in Brazil by Mr. Cross was 82 in.

The measurements above given are those of the largest tree. More useful data for scientific and practical purposes are obtained by taking the mean girth of all the trees on a considerable area. This was done in January, 1897, on the plantation made at Henaratgoda in 1876. This now consists of 45 trees, about 30 ft. apart. The girth was taken at the height of the eye, about 5 ft. 6 in. above the ground. The largest tree was 7 ft. 5 in., the smallest 2 ft. 1 in. in girth. The mean girth was 4 ft. ½ in.

In the plantations made by the Forest Department near Ratnapura measurements were taken in December, 1894, of the mean girth of trees at 3 ft. from the ground, with the following results:—

At Edangoda (4 years old), mean of 100 trees	12.96 in.
Do. (3 years old), do.	50 trees 8.75 in.
Do. (2 years old), do.	20 trees 4.96 in.
At Yattipowa (3 years old), do.	108 trees 9.37 in.
Do. (3 years old), do.	108 trees 9.13 in.

The larger measurement at Yattipowa is that of trees on the western slope, the smaller that of trees on the eastern slope. The difference appears to be due to the fact that the latter are exposed to wind.

TAPPING.—The yield of rubber from very young or slender trees is too small to make their tapping worth while, and it is best for many reasons to abstain from tapping a tree until it has reached a girth of two feet. In a large plantation the girth of the trees always varies between wide limits. A few trees may be fit to tap after the sixth year, and in every subsequent year more and more trees will reach the size necessary. In favourable localities the bulk of the trees should be in bearing before the end of the eleventh year. The results of the experiments hitherto made at Henaratgoda go to show that it is inadvisable, having regard to the future, to tap trees of less than two feet in girth, but it is still an open question whether the minimum size of tree for tapping should not be fixed even higher. This however would of course necessitate longer waiting for the return, as the mean rate of increase of girth in trees of this size is only about three inches per annum.

The methods of tapping and of coagulation of the rubber employed by the native collectors in Brazil and elsewhere are rough, wasteful, and inefficient, and there is great room for improvement. Experiments are being made at Henaratgoda to test methods of tapping and coagulation, and their results will form the subject of a subsequent Circular. At present we shall only describe the method which has been employed for some years in the tappings carried on at Henaratgoda.

The requisites for the work are a ¾-in. chisel, a wooden mallet, a number of clean coconut shells, each cut in two so as to form small basins, a knife, and a supply of clay and water with which to form the gutters round the trees.

The tree is first carefully and lightly shaved with the knife from a height of about 6 ft. down to the ground, so as to form a perfectly smooth surface. Only the outermost layers of the bark must be removed in this process, otherwise the tree will be injured. When the shaving is completed, the tree may be polished by hand, or carefully brushed. The great object in view is to obtain a smooth and clean surface, over which the milk can run easily, without becoming contaminated by small particles of bark or other rubbish, as the market value of rubber depends on its cleanliness.

A clay gutter is next made round the tree about six inches above the ground, so arranged as to catch the milk which will trickle down the tree and empty it by two or more spouts into as many clean coconut shells placed below. Three shells are sufficient for a tree of 2 ft. 6 in. girth, but larger trees may require four or five. The gutter is made by rolling rather wet clay into a sausage form, between the hands, and then pressing it on to the bark, and forming the channel against the bark by aid of a wet finger. The gutter must not be allowed to dry before the tapping is begun, otherwise the rubber will be contaminated by particles of clay; neither must the gutter be so wet or irregular as to allow the rubber to be dirtied.

Incisions may now be made in the bark with the mallet and chisel, commencing near the top of the cleaned portion. A V-shaped cut is made in two strokes. The object to be aimed at is to make these cuts to such a depth as just not to reach the wood. They should stop in the bark close to the cambium, as the vessels which contain the rubber occur only outside, but very close to, the cambium. If the cambium is not injured the wound rapidly heals, but if the cut penetrates this layer, and enters the wood, the healing of the wound is much slower, and at the same time risk is run of introducing parasitic fungi into the wood, which may cause much damage. Injury to the wood also causes a check to the upward flow of sap, and thus to the growth of the tree. Considerable practice is required before the chisel can be habitually driven in to the exact depth necessary. In dealing with a number of trees it will be found most economical and satisfactory to keep separate coolies for each of the various operations required, as they all need much practice.

As soon as the cut is made the white and very sticky milk commences to flow. A second V-shaped incision should be made about a foot below the first, and others at similar distances down to the gutter at the base of the tree. Another set of incisions may then be made parallel to the first, at about ten or twelve inches from them, and other vertical rows of cuts may be made if there

be sufficient room for them. On a tree of 2 ft. 6 in. in girth, four vertical rows of cuts may be made without serious injury.

As each cut is made the milk flowing from the cut above it should be guided downwards to it along the bark by means of a twig, otherwise the milk is liable to be wasted by dropping to the ground from projecting portions of the bark. The bulk of the milk, especially in large trees or trees which have not been recently tapped, ultimately flows into the cups at the base of the tree. These should be kept covered in such a way as to prevent dust or other rubbish falling into the milk. As soon as the milk ceases to flow into the cups these are removed to a warm place, and in a few hours a cake of solid rubber can be removed from each, which should be kept in a dry place until it has become properly dry all through. The remainder of the milk dries upon the tree in the form of long strings, which are stripped off and rolled into balls. The whole of the rubber when dry is now ready for market. The most suitable times of the day and of the year for tapping are still the subject of experiment. The most satisfactory results have on the whole been obtained by tapping in the drier parts of the two monsoons, *i. e.*, from January to April and in August and September. The tapping should be done on dry days, otherwise it is difficult to prevent dilution of the milk and to dry the rubber.

The tappings may follow one another at intervals of a week for about four to eight weeks. The second tapping gives a much larger yield than the first, and the third and fourth tappings are usually very productive. In a series of experiments made during 1897 on trees of about 2 ft. mean girth, the average yield per tree of the successive weekly tappings was as follows:—

	oz.		oz.
First week	... 73	Fourth week	... 80
Second week	... 148	Fifth week	... 67
Third week	... 97	Sixth week	... 52
Total ... 5.17 oz.			

YIELD.—The statements as to yield of rubber found in books of travel and popular articles are very unreliable, and experiments are being made to test the whole question of yield. The late Dr. Trimmen commenced in 1888 to tap one of the original trees at Henaratgoda, then nearly twelve years old and 50½ in. in girth a yard from the ground.

It was tapped on seven days between January 25 and February 15, yielding 17½ oz. of rubber, on six days between July 20 and August 29, yielding 7 oz., and on four days between December 6 and 20, yielding 4½ oz.; a total of 1 lb. 12¾ oz. The same method was followed in alternate years, with results as shown below:—

1888	... 1 lb. 12¾ oz.	1894	... 3 lb. 3 oz.
1890	... 2 lb. 10 oz.	1896	... 3 lb. 0¾ oz.
1892	... 2 lb. 13 oz.		
Total... 13 lb. 7 oz.			

The average yield of this tree from the twelfth to the twenty-first year is thus almost 1½ lb. per annum. This result is very good, and if all the trees of the same age yielded as much rubber, the success of the cultivation would be assured. It should, however, be noted that the girth of this tree in 1888 was larger than the mean girth of the whole plantation, as mentioned above, in 1897, and that therefore this yield, if the tree tapped be accepted as a fair sample, represents rather the result to be expected after twenty years, by which time the average girth of the

trees should be equal to the girth of this one at the time its tapping was commenced. The trees in question are about 30 ft. apart, *i. e.*, 50 trees to the acre. These data thus indicate a yield of about 90 lb. of rubber per acre in the twentieth year, a result insufficient to make it worth the while of private planters to take up rubber cultivation.

It seemed probable that better results might be obtained by tapping younger and smaller trees more closely planted, and experiments were therefore begun in 1896 on a younger plantation of trees at Henaratgoda. The mean girth in January, 1897, taken at 5 ft. 6 in. from the ground, of 225 of these trees was 2 ft. 4½ in. The figures already given for the average weekly yields represent the mean results of the tapping of 27 trees of a mean girth of 1 ft. 10½ in., six inches less than the mean girth of the whole plantation. From six consecutive weekly tappings of each, a mean yield of 5.17 oz. per tree was obtained. This represents a yield of 97 lb. per acre of 300 trees (12 ft. apart). If the trees tapped had been of the same mean girth as the whole plantation, the yield would probably have been at the rate of about 120 lb. per acre. Further, only six tappings were made, and the trees, after a rest of a few months, would probably have stood three or four more tappings whose yield might have been at the rate of 30 or 40 lb. per acre.

No record, unfortunately, was kept of the date when this plantation was made. It is probably twelve years old at least. The sandy soil at Henaratgoda is unfavourable for Para rubber, and in better soil the trees would probably reach this mean girth in ten years or even less. It would seem, therefore, that if this cultivation is taken up in favourable localities, a yield of about 120 to 140 lb. of rubber per acre may be expected after the tenth year. This estimate is, however, liable to modification by the results of experiments which are still in progress.

COST OF OPENING PLANTATIONS.—The following estimate of the first year's cost of opening a plantation of 300 acres of forest land with rubber was prepared by Mr. F. Lewis, Assistant Conservator of Forests, Colombo:—

	R.
Felling and clearing at R12 per acre	...3,600
Lining, 10 ft. by 10 ft., at R2 per acre..	600
Holing, at 75 holes per cooly at 40 cents	697
Filling and planting and carrying plants from their nursery to holes, 300 per cooly at 40 cents	... 175
Draining: 300 ft. of drains per acre at 1 cent per foot run	... 900
Lines for coolies: 1 shed of 10 rooms of 12 ft. by 10 ft., mud walls, and batticalla roof, at R30 per room	... 300
Roads for inspection, 2 miles	... 160
Plant nursery, including watering	... 150
Weeding, at Re. 1 per acre per month	3,600
Cost of surveying lines round plantation, say	... 75
Contingencies, such as special work, bridges over streams, or supplying vacancies, &c.	... 250
Salary of assistant	... 1,000
Tappal cooly..	... 121
Tools	... 300
Total.. 11,927	

This represents an average of R40 per acre. A return of R4,200 is estimated to be obtained

by the sale of timber and firewood from the land cleared. This should suffice to erect the Assistant's bungalow and leave a small margin for contingencies.

To this estimate private planters must add the cost of land and of seed (about R20 per 1,000). These items will probably bring up the total cost for the first year to at least R125 per acre. As a matter of fact, 300 acres is more than can be opened in one year, as the number of seeds required will be at least 160,000, which amounts to nearly two years' crop of the trees in the Botanic Gardens.

For the second, third, and fourth years Mr. Lewis estimates the expenditure on weeding and supplying at R12, R8, and R5, respectively. Assuming that the expenditure in the years following is at the rate of Rs.5 per acre, the cost of the plantation up to and including the tenth year, might work out as follows:—

	R.
Cost of land, 300 acres at R75 ..	22,500
Cost of seed, say	3,600
First year's cost, as above... ..	11,927
Weeding and supplying, second year ..	3,600
Do. third year ...	2,400
Do. fourth year ...	1,500
Do. fifth to tenth	
years, inclusive	9,000
Salary of assistant, second to tenth	
years, inclusive	9,000
Tappal cooly and tools, second to tenth	
years, inclusive	1,250

Total ..	75,777

Allowing interest at the rate of 7 per cent. on all money expended up to to the end of the tenth year, the outlay upon the plantation will amount to at least Rs. 110,000, or Rs. 366.66 per acre.

RETURN.—The value of Para rubber in the London market varies between two and four shillings per lb. according to the quality of the rubber and the state of the market. Of the rubber which has been collected in the Botanic Gardens and sent home for valuation, a large proportion has been valued at almost the highest market price then ruling, but a considerable proportion of the rubber is always of inferior quality, being mixed with particles of dirt. If we estimate the average value of the crop at 2s. per lb., and the yield in the tenth year at 100 lb. only per acre, the return in that year will be £10, or say R150 per acre. The cost of harvesting should not be more than R50 per acre, including carriage to London. This leaves a margin of R100 per acre, representing a return of 27 per cent. upon the original outlay; if 12 per cent. be allowed for contingencies and the usual vicissitudes of a tropical cultivation, there remains still a prospect of a good return on the capital expended.

JOHN C. WILLIS,

Director, Royal Botanic Gardens.

CEYLON PLANTING AND PLANTERS IN HAWAII.

Mr. Hawke, of Orion, who is constantly making trips abroad from Ceylon, returned yesterday, after visiting a part of the world that Ceylon men do not often reach. Leaving Ceylon his intention was to travel *via* China and Japan to America, and so to Europe. China he did not like; but he thought Japan pleasant, and he stayed there two months, going on to San Francisco, *via* Honolulu. On his way to 'Frisco a fellow-passenger on the steamer revealed himself to him as Mr. Caine, formerly of Ceylon, and told him how well he was doing as a coffee-planter in Hawaii. Mr. Hawke was so interested that when he reached 'Frisco he went back to Hawaii, and he now returns from there perfectly enamoured of the place. He says the island is most suitable for Coffee planting, and a good acreage is already under cultivation, growing in rich volcanic soil—a soil that could not be found in Ceylon anywhere. Labor was plentiful, shipping facilities excellent, and Hawaiian Coffee was fetching 80s. a cwt. He secured 400 acres of land at an elevation of 2,000 ft. from the Provisional Government, and he returned at once to Ceylon to make arrangements to sell Orion estate and settle down in the Sandwich Isles to plant up his new property. Almost all the Coffee there is Arabian.—“Local Times,” Feb. 19.

LIBERIAN COFFEE.

ITS PROSPECTS IN THE MALAY PENINSULA.

[By a Former Ceylon Planter.]

Selangor is undoubtedly the leading State as far as coffee is concerned. Two years ago, when the price of Liberian coffee was between \$45 and \$47, the prospects of Liberian coffee certainly looked bright, and the Selangor Government gave out thousands of small blocks of land to Javanese, who looked after their coffee tolerably well during the high prices; but a look-out of a railway carriage window between Klang and Kwala Lumpur now will show what a terrible change has come about with low prices. The land is fast becoming jungle again, and disease is being spread over the country by this uncared-for coffee; and this is not the only evil caused by giving out this land to the Javanese, for the lands given out were small, narrow blocks, all along the best roads and railways in the country, so spoiling the frontage of a vast extent of land behind, for no planter cares to take up land behind these seedbeds of disease and nurseries of weeds.

Another evil is that the Javanese, who were about the best labour force in the country, have become a lazy lot of good-for-nothing impudent men, and it is the general opinion amongst the planters that this labour force is lost to the country.

BAD TIMES AHEAD.

It is my opinion that we are about to face some years of very bad times, not only in short prices, but in short labour forces, and it will only be some of the best estates that will pull through the crisis; what chance will estates have that are not able to give three piculs per acre without manuring; and again what chance will others have that average 30 per cent. on the sick list? An answer to this will be to go in for new products; but, with bad times, where is the money to come from? besides, few of the old places are fit for new products.

HOURS OF WORK ON AN ESTATE.

In the face of this, it behoves planters to go in for every economy that is practicable, and the most practicable economy that I know of is the changing of the working hours from 6 a. m. to 2 p. m. to from 6 a. m. to 10-30 a. m., and again in the evening from 1-30 p. m. to 5-30 p. m. giving the coolies, conductors, and superintendents three hours' rest in the heat of the day. It is a well-known fact that, when the superintendent goes home for breakfast, the coolies

sit down under the coffee trees; then, why not have them in their lines, where they can also get a good meal and go out fresh in the cool of the evening. I positively state now that I have proved that I can get 30 per cent more out of my labour in this way; and I ask any superintending whether he feels very fit to look after his work in a burning sun after a heavy meal and "perhaps" a bottle of beer. He wants two hours; rest at least, and so does any other man, and, what is more, most of them take it.

This question was brought before the S. P. A. a few days ago, and it required the casting vote of the Chairman to decide it against the motion for working morning and evening. Many men who then voted against it stated that they knew it was the best thing to do. One man said his lines were too far away for the men to get home (his lines should be near his store, when men can go home after measuring their first box of *palam*). He was a cricketer. Another man said rain came on in the evening, therefore he would vote against it. He was a golfer. Another said his coolies would not turn out again. He was a tennis player, and so a good motion was lost, a motion that would save the proprietors of estates 30 per cent on the labour expenditure and half their bill for doctors and medicine.

In the face of the labour difficulty individual estates cannot do it; but if two thirds of the estates agreed to do it, it could be done, and some of the others might be made to do it. Once a week is quite enough for a man to get away to his club and his golf, and any man who has not the interest of the estate at heart enough to make him walk round it in the evenings, whether his coolies are working or not, is not the man I used to know in Ceylon.

THE CURING OF LIBERIAN COFFEE.

The next great difficulty we have to face is the bad state our coffee arrives in the London market. I could not believe that the samples I saw were Straits Liberian coffee; and I am positive that the cause was mixing a lot of coffee from different estates together, and sending it home in sacks instead of in barrels. No matter how good and well-dried a lot of, say, 50 tons may be, if it is mixed with even 10 tons of imperfectly dried coffee, mildew will set in and spoil the lot before it reaches the London market; and this would happen even were it in barrels, so that uniform dryness must be insisted on.

Sizing of Coffee.—This is one of the great objections to our coffee, as it cannot be evenly roasted unless it is of equal size. This seems a very easy matter to settle, but it must be done on a large scale, and most estates are so small that they have not a chance of being able to do it on their own estates.

A CENTRAL CURING ESTABLISHMENT.

The remedy for these two predominating evils is a curing establishment in Klang. My own idea is an establishment owned by the planters of Selangor and worked by a directorate appointed by the S. P. A. At first I thought that Kwala Klang was the best place, but I have changed my mind on that question, on account of the difficulty of getting women and children at the Kwala, when they are very plentiful in and about the present town of Klang.

If this establishment is formed in Klang—whether it be by the Planters or by private enterprise—it must be on a large scale, if it gets $\frac{2}{3}$ of the support of the acreage of coffee now planted in this State. The mill will make large profits, as they will get high prices for their coffee in London, and buy at the ruling price of the market here.

They will be able to dry their coffee to a uniform dryness, size their coffee to different sizes, and send each sort to the most suitable market for it, and pack all in barrels or tea boxes instead of in bags.

"Is Liberian Coffee any good, and will it ever bring a fair price in the American and London markets, and what is the reason that it is at such a low price in comparison to other coffees?"

The low price in comparison to other coffees is the most serious question of all, for other countries are getting a good paying price, and will go on increasing

their production, whereas if we were all at a low price, it would be only the waiting for the survival of the fittest to get a good price again.

As to whether Liberian coffee is any good or not, I must say I trust to my own palate, and to the palates of thousands who have declared it to be as good as any other coffee; and I believe that, if we can only produce it for sale in the London market as it leaves here, it will fetch a price in proportion to what it is worth. I once sent a tin of Johore Liberian Coffee to Britain, and most of the people in our own country have tasted it and pronounced it excellent. I saw and drank some of that same coffee at home two years afterwards, and it looked as glossy and as sound as the day it left the store, and tasted equally as well as it looked—very different to the dull mouldy-looking, half-decayed coffee I saw with London merchants as samples of Straits Liberian. I sent that sample home in a Java sugar tin soldered down.

THE CRISIS.

I have hopes that the best estates will pull through this crisis; but I should not like to raise the hopes of men in this Peninsula who have poor bad estates, some of them estates that I reported on years ago before coffee ever reached \$35 and recommended the abandonment of.

Those very estates kept on until coffee reached \$17, and even then they did not pay. The owners of those estates ought to know what to do now, for coffee is not likely to reach \$17 again. I only wish it would.

The fact of it is that any estate that requires manure to produce an average of $3\frac{1}{2}$ piculs per acre all over should be abandoned, unless the land is good for other products such as Rubber; but nine tenths of them are not fit to plant Para Rubber in, and more than half of them are good for nothing.

It is not until coffee comes into bearing that the real brains of a manager are tested. You often hear a man say on passing an estate: this is a fine little estate, and it is well managed, never thinking for one moment what it cost. Any imbecile can open up a small estate if he spends enough money on it; the good man is the one who can open up a place as well as it can be done, and at as small a cost as any other man can do it. I know of estates being opened up in this State at such a cost that, if coffee were to go to \$40 per picul and remain there, they would never pay. As a rule, the unfortunate men who supply the money do not question the acreage opened up and the cost of it. If they did it would be better for themselves and a man might have a chance of making a coolie give a day's work for a day's pay.

For men who have good rich young estates it is the time to make all improvements possible, above all things to get a day's work for a day's pay and to try to send a better sample to the European market.

NIL DISPERANDUM.

PREPARATION OF TANNIN EXTRACTS.

Under the name of tannin or tannic acid are included a number of different but closely allied substances widely distributed throughout the vegetable kingdom, which all agree in this one particular that they are greedily absorbed by the raw hide of animals, forming with it leather. They are contained in abundance in galls; in certain fruit, such as that of *Terminalia Chebula*, *T. Citrina*, *T. Bellerica*, *Phyllanthus Emblica*, etc.; in the leaves of some trees, such as *Sumach* and *Anogeissus latifolia*; in the wood of most trees possessing a durable heart-wood, such as oaks, chestnuts, Acacias, sál, etc.; and last, but not least, in the bark of many trees and bushes, such as oaks, hahnl, sál, *Terminalia tomentosa*, *Soywida febrifuga*, spruce, *Pinus longifolia*, *Cassia auriculata*, etc.

Galls, fruit and leaves are easily exportable in a dry condition, but wood and bark are both bulky articles to transport over long distances. Moreover, in Europe the old system of tanning by stratifying hides alternately with layers of coarsely ground

bark, a system which occupied from one to two years before the leather was ready, has been rapidly giving place to tanning with liquid extracts, which have the great advantage of penetrating the hides quickly and shortening the process down to a few weeks. The question, therefore, is to turn to account the enormous quantities of bark and wood which at present go to pure waste in our Indian forests and to convert them into tannin extracts for export to Europe and even for use in the country. Under the old system of tanning, Europe had in her cold climate an advantage which forbade all Indian competition in the preparation of leather. The native system of sewing each hide into a bag and filling it with tan, besides not giving the hide enough time to absorb the tannin thoroughly is much too slow, cumbersome and space-demanding to have ever had any chance of producing an article fit to compete against the European one. But now that the use of liquid extracts has shortened the process of tanning so considerably, it seems absurd that India should export raw hides and not leather.

Professor Henry of the Nancy Forest School has shown, as the result of careful and repeated analyses, that in the common European oak the bark contains most tannin, heartwood coming next, with the sapwood a very bad third—so bad, indeed, that it would be an advantage if the sapwood could be got rid of by some cheap process when preparing the extract. The bark of the root stock is richest in tannin, the butt-end of the trunk being only a little behind it, while at the top of the trunk the bark contains hardly more tannin than the outer layers of heartwood. As regards the heartwood, the richest portion is that in the butt-end; moreover, the quantity of tannin diminishes from outside towards the centre of the tree. The heartwood of the larger branches contains more tannin than that of the top of the trunk. The very small branches and twigs, being nearly all bark, contain as much as the heartwood of the base of the trunk. The wood of coppice-grown oak is richer in tannin than that of high-forest grown oak, and generally the broader the annual rings are, the larger is the quantity of tannin. Also oak grown on limestone soils yields more tannin than oak from a soil deficient in limestone.

Another interesting result of Professor Henry's experiments shows that the tannin in the bark and sapwood deteriorates and disappears much more rapidly than that in the heartwood; in the first two it exists in the form of amorphous granules, which, in contact with water, first of all break up into minute globules and form an opaque mass, and finally become completely dissolved, whereas in the heartwood the tannin is found as a homogeneous deposit impregnating the membranes not only of the medullary rays, but also of all the fibrous tissues, and in this condition is better preserved. Even fossil oak wood contains some tannin, but fungi destroy the tannin completely, wood suffering from red rot containing no tannin at all.

It is very desirable to have similar analysis made of our Indian trees, which contain sufficient tannin for the leather industry, but in the meantime we may presume that what M. Henry has found out for the common European oak is more or less true of all trees.

I will now proceed to describe, first, the process of extraction treated in a general manner, and then briefly some of the more usual processes employed.

Method of Extraction.

I.—GENERALITIES.

Whatever the special method employed, the following is the order of the processes to be gone through:—

(1.) The wood or bark must be chopped up or shaved fine transverse to the grain, so that the fibres and vessels may be cut across.

(2.) The chips or shavings, as the case may be, must be macerated or subjected to the action of hot-water or steam, so as to yield an infusion or decoction. As all natural waters contain lime, and lime diminishes the yield of tannin, either distilled water must be used (expensive) or the water should

be mixed with a small quantity of sulphuric or oxalic acid, in order that the lime may be precipitated, excess of acid being afterwards got rid of by the addition of an alkali in the form of a carbonate or caustic.

(3.) The extract should next be cleared of the colouring pectosic and other matters in suspension. This is done either by treating with blood or any other albuminous substance, such as the coagulum of casein (blood has hitherto given the best results), or by filtering through animal charcoal (very wasteful, as the charcoal absorbs a large proportion of the tannin), or by the addition of metallic salts, or by centrifugal force (on the same principle as that of the cream separator). Each and every system necessarily involves some loss of tannin.

(4.) Mechanical filtration, preceded, if necessary, by decantation.

(5.) Concentration to the degree required, if a liquid is wanted, or reduction to an earthy form like cutch. In either case the pneumatic process should be used.

II.—SPECIAL PROCESSES.

It will suffice to describe here five processes, all of which may be easily employed in India and require no expensive or special plant that cannot be made in the country itself.

1. *Gondolo's Process.*

The chips or shavings are macerated, with or without the application of heat, in water, to which sulphuric acid has been added at the rate of 6 grammes to a litre. The extraction of the tannin being complete, the infusion is treated with sodium carbonate, 1 gramme for every 6 grammes of acid used. A precipitate forms which is got rid of by decantation.

The extract thus obtained is not highly coloured; but in case a lighter coloured and perfectly limpid fluid is required, clarification must be undertaken with a coagulating substance. This latter must be mixed with the infusion at a temperature not exceeding 45° C. The temperature should then be quickly raised, the mixture being constantly and energetically stirred. Care must, however, be taken not to allow the temperature to exceed that necessary for coagulation, otherwise the albumen will remain in suspension and fail to absorb the colouring matters. As soon as coagulation is complete, the liquid must be allowed to cool. After a rest of about an hour it is drawn off and filtered and then concentrated to 30 to 45° Baumé, according to requirements. The extract is very rich in tannin, is extremely soluble, and is of the colour of honey.

2. *Another Process.*

When the wood or bark used is of a very deep colour, a slightly different process has to be employed.

Macerate in water, adding at any time 20 grms. blood for every kilog. of bark and wood and keeping the temperature well below 80° C. When the maceration is complete, the temperature of the liquid is to be brought down to about 55° C., and 1 gm. of carbonate of soda or of another alkaline salt and 15 grms. of blood added to every litre of the liquid. The temperature should now be raised, whilst constantly stirring and gradually adding 6 decigrammes of sulphuric acid for every litre of the infusion. The result is that a flocculent mass at once forms in the liquid, consisting of lime salts and colouring matters with the albumen.

Cool, decant and concentrate as before.

3. *A Third Process.*

This is a slight modification of the preceding, a sulphite or bisulphite being substituted for the sulphuric acid and added *during*, not *after*, the maceration. The salt is decomposed, tannates and free sulphurous acid being produced, the latter of which acts as a decoloriser, becoming thereby changed into sulphuric acid, which precipitates the lime salts in the water and prevents their alkaline action on the tannin. The tannates or free sulphite or bisulphite, as the case may be, that still remain unused in the liquor, are got rid of by the addition of sufficient sulphuric

cid. Although up to this no blood has been used, he extract is less highly coloured than that obtained by the immediately preceding method.

To decolorise still further, proceed to coagulate with blood, and decant, filter and concentrate as before. The liquor thus obtained is of the colour of pale honey, and is so limpid that it enters the thickest hide rapidly and converts it into leather in the course of a few days.

4. Vallon's Process.

For this process a special, but very simple apparatus is required. A large square copper or brass vessel about 7 feet high and 3 feet side, divided by the removable cross-plates into three compartments, a false bottom of very stout wire gauze, which can be pulled up by means of four rods when the vessel is to be emptied.

Each of the plates (E.F., GH) has 250 circular perforations about two-fifths of an inch in diameter. TT is a tube of about 3 inches bore and about 6 feet long, which passes through the centre of both moveable plates and is held in place by the lower plate at such a height that its lower extremity is only a few inches above the bottom of the vessel, while the upper extremity projects a little beyond the upper plate.

PPP is a pipe through which steam is introduced into the lowest compartment of the vessel, while t_1 is a tap through which fresh water can be let into the same compartment, and t_2 another tap through which that compartment can be emptied.

The height of the lowest compartment is about 23 inches, that of the highest about 6 inches.

To set the apparatus in operation, the middle compartment is filled tight with the chips or shavings of which the tannin is to be extracted, and distilled water is introduced into the lowest compartment up to a few inches below the upper level of the pipe PP. Steam is now let in. The water soon boils and, under compression of the steam in the space above it, is forced up through the central tube TT into the highest compartment, whence it enters the middle one below and finds its way back into the lowest compartment carrying away with it in solution extractive matter from the chips or shavings. In this way a continuous circulation of the water is set up, and in about 6 hours the extraction is complete.

By working a battery of several such vessels so connected with one another that the extract from the first, when the shavings have been sufficiently exhausted, can be turned on, through a tube furnished with a tap, from the tube KK into the uppermost chamber of the second vessel, and so on up to the last vessel, a liquor of great strength is at once obtained which requires very little concentration.

The advantages of this system are: (1) that the strongest possible extract is obtained with a given limited quantity of water,* so that the labour and expense of concentration is very appreciably diminished; (2) that the liquor is light-coloured and fairly clear, and hardly requires special bleaching if the wood used does not contain a dark dye; (3) that it exhausts the wood of all its tannin; and (4) that the extract contains less gallic acid and gallate of tannin than that obtained by any other process. Moreover, as no chemicals are required and the entire process is within the comprehension of the lowest intelligence, the method is specially adapted for employment in our Indian forests, however remote. It would suit cutch manufacture perfectly.

The remark may here be made that there seems no reason why the vessel as well as the partitions should not be of wood, which would not only be much cheaper than metal, but also retain heat better and have no injurious effect on the tannin. Even the wire gauze sieve could be replaced by a wooden trellis frame covered over first with bamboo matting

* When chestnut wood, which contains 5 to 6 per cent of its weight of tannin, is used, the liquor obtained by decoction in a single vessel marks 50-60 Baumé and contains 5 per cent of tannin.

and then with stont cotton drill, which would filter as effectively as the finest wire-gauze.

5. Luc's Process.

M. Luc owns several large tanneries, one of which is at Nancy. He employs only oak, not only because oak liquor produces firmer leather and is more easily rendered lighter coloured than chestnut extract, but also because the tree is more widely distributed in France and therefore more easily procured. He uses only root-stocks, butt-ends and branches, i.e., such pieces as are useless for timber; but he rejects everything that measures less than 4 inches in diameter at the small end. His wood costs him about 22½ shillings per 100 stacked cubic feet delivered at the tannery.

At first M. Luc used to have the wood barked on the express advice of the chemist who invented the system employed by him, but he found the cost of barking very heavy and gave it up. Since doing so, the liquor he obtains is richer in tannin and is more easily made light coloured.

The wood is reduced to shavings less than one-twelfth of an inch thick. The decoction is effected in wooden vats, each taking nearly 6,200 lb. of chips, with boiling water which is kept in constant circulations. The vats are connected together so that the liquor from one passes into another holding fresher chips. When the liquor marks 25° Baumé it is run into a large wooden barrel containing a serpentine tube, through which cold water is constantly running. As soon as the temperature of the liquor has fallen to 30° to 35°C., blood is added with a little sulphuric acid. The temperature is then raised to 60°-65°C. to coagulate the albumen of the blood. By this clarification the density of the liquor is reduced to 2° Baumé. Concentration is now effected by the ordinary pneumatic process until the areometer marks 20° to 25°.

This extract is not used by itself, but is only added gradually to strengthen the ordinary tan liquor in which the hides are soaking.

The gallon weighs 12 lb. and sells at 23½d. Even at this rate the profits are very high, and M. Luc is driving a roaring business.

The exhausted chips are used as fuel for generating steam for the machinery and other purpose, special grates being used which do away with the necessity of previously drying the chips.

III. CONCLUDING REMARKS.

In India we could employ not only wood, but also barks for the preparation of tanning extracts. One of the functions of the Forest School at Dehra Doo should be to analyse for tannins the bark and wood of all our likely species. The system of effecting analyses with the help of students, which was in force during Dr. Warth's tenure of the Instructorship of Natural Sciences, should be resumed, especially as there is now an Instructor to spare during the open season. To assist the Instructor only the more intelligent students, who have shown a bent for chemistry, would be selected.

It will be remembered that Captain Wood, late Conservator of Forests of the Oudh Circle, made a solid extract of sál bark which he tried to get accepted at Cawnpore and by tanners in England. The experiment was not successful owing, no doubt, to the extract containing colouring matters and other impurities, and probably also to being prepared at too high a temperature; but the venture certainly deserves being repeated, not so much in order to make the preparation of the extract a departmental business, as to attract and invite to it private enterprise.—*Indian Forester.*

THE CODLIN-MOTH.—These orchardists who have but few Apples this year will have their compensation next year in the greatly lessened numbers of the Codlin-moth. It has been remarked that in orchards which had few Apples in any one year, the fruits were not greatly injured the following year, even when no measures were taken to prevent an attack. This was doubtless owing to the moth finding few or no fruit in which to develop the maggot.—*Gardeners' Chronicle.*

the calyx or husk from the seed ball. Cook the husks as you would any fruit until done and strain the juice out for jelly as from any other fruit; in fact treating it as you would any jelly. It jells very easily and makes the most beautiful jelly ever seen, we all think. The residue, after straining out the juice may be put through a colander or vegetable sieve and made into marmalade or sauce, or the entire product may be so used without making jelly, and will be found excellent; or it may be cooked and canned as well as any other fruit and used in any way. Pies, short-cake and as a spread for the youngsters' school lunch are examples of its uses. In looks and taste it is almost identical with cranberries, only not requiring so much sugar and cooking, and lacking the bitter taste sometimes found in cranberries. A pleasant drink may be made from the leaves by boiling them in clear water. Pour this off, sweeten it and boil down until quite rich and when cool add a few spoonfuls to a glass of water. It is very refreshing. This juice from the leaves may be also made into jelly if one wishes, and the leaves may be eaten as greens. It is remarkably prolific and can be put to so many uses that it may well be considered one of the most useful plants we can grow in Florida. It is an annual and of course must be planted every year as with cabbage or potatoes, but it is tenacious of life and easily grown. We planted ours six by six feet apart last spring and now it is crowding together and presents a solid mass of green, red and yellow all over the patch, and fully eight feet high from the ground. The 150 plants will yield many bushels of fruit, and helps mightily in our living for a year, for I see evidences of store of jelly and canned goods to be made from it.

Another year I shall plant further apart, eight by eight, I think, and this you must remember is on a sand hill in the lake region of Polk county; on richer soil it spreads out even more.

Auburndale, Fla.

W. S. PRESTON.

NORTH NYASSA NEWS.

Plumbago (black-lead) has been discovered in the southern portion of this district. It is in the solid form and of excellent quality. Specimens of it were brought in to Deep Bay by the natives who use it for colouring their earthenware pots.

Game is more plentiful on the Konde plains this year than it has been since rinderpest visited the district in 1892. Amongst the game, large herds of Roan Antelope are to be met with, apparently having been forced to leave the hills through scarcity of water.

An antelope which may prove to be a new one has recently been discovered near here. It is very small with horns only about $1\frac{1}{2}$ inches long. The colour of the buck is very similar to that of the otter.—*B. C. Africa Gazette*, Nov. 29.

AN INVENTION BY A CEYLON PLANTER.

Mr. A. K. Leitch, of Great Valley, Deltota, has patented an invention which is "an improvement in Lock-Nuts," and relates to improvements in lock-nuts for the purpose of rigidly bolting together various parts of materials employed in mechanical constructions, and to prevent any nut so employed becoming loose on the bolt. "The invention consists of making a groove in the bolt, deep enough to take a flexible pin or wire below the level of the threads of the screw, and at the end of the groove a hole is drilled in the bolt so as to allow of the bent end or head of the pin being passed into it, and so secured. A pin is then taken, bent at right angles at one end and it is laid in the groove with the bent por-

tion or head in the hole in the bolt, the bolt being passed through the bolt holes of the pieces to be connected together, and is then screwed on the nut (which may have any number of grooves on the face of it, so as to allow of the bending over of the other or tail end of the pin or wire without disturbing the level of the face, and so making the hold more secure and the tail end of the pin is bent over in one of the grooves cut in the face of the nut after the said nut has been thoroughly tightened up. Although only six grooves are usually cut in the face of the nut there may be any number where there is room for radiating from the centre for the end of the pin to be bent at right angles, over, depressed, or clamped into either of aforesaid grooves. It will be seen by this method that, after the pin has been fixed, it is impossible for the nut to become loose from the bolt and bolt head, owing to the nut being fixed to the bolt by the action of clinching the pin described.

CEYLON Vs. COCHIN COCONUT OIL—AN OLD COLOMBO MERCHANT.

NOTES FROM HOME.

(By a very old Colonist)

By the time you receive this it will be nearly two months since your most interesting papers containing what we may call.

THE COCONUT OIL QUESTION

came to hand and again the *Tropical Agriculturist* with much more on the same subject. Had it been possible I might have written you a short summing-up of the array of facts your circulated enquiries have elicited. In fact the question has been well threshed out and was well put in a nutshell by your correspondent W. B. L., an authority of experience.

Your

MEMOIR OF C. SHAND

is an admirable one, and the man himself an eminent type of the Pioneers you wish to record. We were known to each other from the earliest days. He was my neighbour (25 miles away) in Sabaragamuwa. As a merchant no one ever came to Ceylon with so thorough a mercantile training in the thick of Liverpool business. I last saw him at his London office on my arrival home at the end of 1870. I find he is two years my junior. N.B.—Mr. Shand did not marry the daughter of plain Mr. Symons, but of Colonel Symons, R.A., then Commandant of Artillery in Ceylon.

COCONUTS AGAIN.

I think it must be conceded that the climate of Southern India is hotter and drier than Ceylon (I found it so)—therefore more favorable for nuts and copra. Pruning away old fruit stalks does not bleed the trees, but is practised, as our rose cultivators here cut off the bud or seed vessel after the flower has gone off by which the blooms are increased. If coconut planters will take the lesson, they may gain for Ceylon oil a good reputation in Europe. Interior oil there will always be as of coffee and probably now of tea. By adopting new methods, coffee (Ceylon) was raised from the "elephant trol" of the thirties to the splendid samples which ruled the English market in late years. The natives greatly improved the merchantable condition of their coffee following the methods of English planters to some extent; and they may do so in copra and oil.

WYNAAD PLANTERS' ASSOCIATION: PROGRESS OF TEA PLANTING.

We have received copy of proceedings of the annual general meeting held on January 5th, when the annual report for 1897, was read. Among other things it noticed work done by United P.A.S.I. as to finances:—

A Reserve Fund of Rs.825.12.0 was established, of which Rs.5,000/ has been placed at deposit with Messrs. Arnthnot & Co., and the rest kept in hand to meet payments voted, if certain conditions are fulfilled. One of these payments is Rs.2,000/ towards the introduction of Lady Birds to Combat Scale pests, and I think this payment will have to be made, as the Govt. of Madras have agreed to pay half the cost, and the Lower Palneys are also prepared to pay up handsomely. Another payment (was Rs.2,000/ per annum towards the expense of an Agricultural Chemist, if District Associations and the various Governments concerned will also contribute. I think it doubtful if this payment will be made, as I am informed the Mysore Govt. will engage a chemist and collect subscriptions for Mysore planters, and that the only other district which will contribute any considerable sum is the Nilgiris, which promises Rs.2,100/ per annum. The Shevaroyis may also subscribe, but two districts will hardly provide enough money to start such an expensive scheme. The third payment is Rs.1,000/ towards the expenses of Mr. Cameron, if the Mysore Govt. will lend his services for the improvement of the strain of coffee, I do not know if this payment will be required or not. The other important resolutions passed were in favour of reopening the Mints; of an export tax on Bones.

But we are told as to the above that the Wynaad Association approved of the agitation for the reopening of the Mints, but disapproved of the schemes for leaf disease remedies and the employment of an agricultural chemist, and has not subscribed to the introduction of Lady Birds to combat Scale pests.

From the general remarks we learn that,—

Tea continues to be extended, and will shortly require an increased supply of labour, which it should not be difficult to get. Arabica crops are very short this year, as is the case in most parts of Southern India. Prospects for next year are, however, very good, there being every indication of a plentiful show of spike. Liberian coffee continues much as last year, and is not likely to be extended largely until good crops are realised. One of the greatest dangers to the future prosperity of the district lies in the action of Government in forcing up exchange, while our competitors in both tea and coffee enjoy an unprecedentedly low rate of exchange. With Brazil exchange at the equivalent of 7 per rupee and consequently Brazil coffee in superabundance at 25s/ to 30s/ a cwt. we may consider ourselves lucky that our prices for Arabica coffee have fallen only from 100s/ to 80s/, although Liberian has gone down from 75s/ to 45s/. Any further fall in price, coupled with high exchange, would render the cultivation of Arabica unprofitable. It is difficult to regard with equanimity the adherence of Government to a policy, which threatens to ruin our industry, and the whole export trade of India. Another very great danger to our prosperity is the insufficient grant for the upkeep of roads.

The election of office-bearers resulted in Mr. R. K. Walker being elected Chairman for the coming year, and Mr. de Fonblanque, Hony. Secretary.

NAHAVILLE ESTATE COMPANY, LIMITED.

The annual general meeting of shareholders of the Nahaville Estates Company, Limited, was held this afternoon at No. 14, Queen Street, Colombo, the registered office of the Company.

Mr. A. Orchard presided, and the others present were: Messrs. J. M. Mason, William Anderson, Gordon Pyper, J. Paterson, J. Lewis Gordon, and Mr. T. S. Grigson by his attorney Mr. W. Anderson, Mr. A. F. Souter by his attorney Mr. F. W. Waldoek, and Mr. W. H. Walker by his proxy, held by Mr. J. Paterson.

The fourth annual report of the Directors was laid on the table:—

The Directors beg to submit their Fourth Annual Report together with a Statement of Accounts for the year ended 30th September, 1897.

It is with regret that they find themselves unable to recommend the payment of a dividend in connection with the past season's work.

The crops, though much larger in quantity than those of the preceding season, have, owing to the fall in prices realised very little more money, and as the expenditure has been in proportion to the amount of produce harvested, the net income shows a material falling-off.

With a diminished income the Directors have had to provide during the year for the upkeep of a large area of land which has not reached the profit-yielding stage, and there has been some outlay in connection with the Factory now being erected on Nahavilla Estate, and a considerable increase in the Coast Advance Account.

The latter has been a source of anxiety throughout the year, and since the beginning of the current season there has been trouble with the labour on Gallala, which it is feared will end in a portion of the outstandings on that Estate having to be written off.

The remaining advances are believed to be good and recoverable.

A Factory is in course of erection on Nahavilla Estate.

Messrs. Mason and Orchard visited the Uva properties in company lately, and were favourably impressed with their appearance and prospects.

The following is a definition of the Company's property as on the 30th September last:—

	Nahavilla.	Ury.	Mahapaha-galla.	Gallala.	Total.	
Tea in full bearing	..273	209	195	313	990	
Do. partial bearing	.. 61	—	—	—	61	
Do. not in bearing and in course of planting..	.. —	319	57	3	379	
Coffee	..120	48	—	—	168	
Forest	.. 46	66	5	72	189	
Cinchona, Grass, Fuel, Trees, Patna, &c.	..101	121	66	244½	532½	
		601	763	323	632½	2,319½

Mr. J. M. Mason retires by rotation from the Board of Directors, but is eligible for re-election.

—By order, GEORGE STEUART & Co.,
Colombo, 19th Jan. 1898. Agents and Secretaries.

The adoption of the report was proposed by the CHAIRMAN, and was seconded by Mr. GORDON PYPER. The motion was carried.

It was proposed by Mr. J. PATERSON and seconded by Mr. Mason, that Mr. J. Guthrie be reappointed as Auditor for the current year. The motion was carried.

It was proposed by Mr. WALDOCK and seconded by Mr. PATERSON, that Mr. Mason who retired from the Board of Directors by rotation, be re-elected as Director. The motion was carried.

A sum of Rs.1,500 was voted to remunerate the Directors for their services during the past year, but the members of the board present at the meeting intimated that it would be

SCIENTIFIC MANURING.

One does not expect to find agricultural information, especially on that branch of agriculture which deals with the latest advances in the scientific treatment of the soil, in an ecclesiastical journal; but the *Guardian*, one of the best edited and most influential organs of the Anglican Church, claims to be a religious paper in other than the ordinarily accepted sense. It is not entirely devoted to the discussion of religious questions. Its editorial notes, discussing the principal political topics of the week, are singularly well-written and judicious; and Mr. Gladstone has been quoted as having declared them to be among the best-written and fairest in current literature, though they are of late years decidedly Unionist in their tendency. The column articles are somewhat heavier, but are also well worth reading; and among these, at frequent intervals, is a paper of interest to the farmer, and presumably also to the country-clergyman, whose income still to a great extent depends on the soil and its treatment. We have been interested by recent articles, which present the details of experiments with manure, after the most approved scientific fashion, by comparing the yield of unmanured plots with manured; experiments in poultry-keeping with details of cost; in fattening cattle and pigs for the market:—all worked out with business-like accuracy, and generally tending to show how a limited income may be helped by small industries which are at once interesting and conducive to health. In one of these issues, we have noted a very instructive article, dealing with recent discussions on manuring which has a bearing on much that is going on among ourselves, in view of the growing interest in fertilizing substances, and their projected application to the soil on scientific principles. Probably, the enterprise of Messrs. Freudenberg & Co. and Messrs. Baur & Co. is not wholly unconnected with the movement in Germany to which the article refers. For, two topics to which special attention is drawn, with a preliminary lament at the paucity of agriculturists who read what is intended for their benefit, are first the inquiry by two eminent German Professors into the problem of combining ordinary farmyard manure with certain artificial manures—"notably those containing nitrogen in the form of nitrate of soda;" and second the success attending the use of basic slag to both wheat and clover in some of the farms of the Midlands. The topics are not wholly new; but we are not sure that we have ever seen the German conclusions so explicitly set forth, as going counter to accepted theories and practice. Not only is it claimed that the mixture of artificial and farmyard manures, as above described, leads to no improvement in the constituents but it is distinctly asserted that the combination detracts from the value of the separate manures! The theory is that the "denitrifying organisms" in the farmyard manure reduce the nitric acid to its elements of free nitrogen and oxygen, and so render it incapable of serving as plant food. Superphosphate and kainit are said to increase this deleterious action, by giving vitality and power to the denitrifying organisms. Professor Somerville of the Durham College of Science has found support for these conclusions in the experiments he had directed in the North of England, where, in certain instances, the crop of turnips was actually diminished in fields which

had a dressing of farm manure and superphosphates! We may note in this connection that in papers on scientific manuring recently circulated locally, there is a strong recommendation that kainit, which is condemned above for mixing purposes, should be added to cattle or stable manure or daily sprinkled over heaps, as it "has been proved to have the property, in a certain degree, of preventing loss of nitrogen from cattle manure"! We know that on one estate at least on which Messrs. Freudenberg's manures are having a trial, kainit has been sprinkled over the usual combination of cattle manure and bones dug into the soil at the root of coconut trees; and we hope to receive information, in due course, of any difference that may be observed, in the appearance of the trees and in crop, between the fields thus treated, and those to which kainit has not been so applied.

The German experiments go counter to more than the mixture of artificial and natural manures. They are said to establish—the experiments were limited to pots,—that horse and cow dung added to the soil give a smaller crop than the unaided soil, and a much smaller crop than the soil assisted only with a dose of nitrate of soda containing the same amount of nitrogen as the dung. The writer in the *Guardian*, as we think rightly, refuses to accept this result as justifying distrust in the universal experience and belief of farmers in favour of the use of the droppings of animals to enrich the soil. The material used may have been too fresh, it may have been used in too large a quantity, or in its decomposition it may have had an untoward effect on the mechanical condition of the soil; but it is important to note that various practical English farmers insist that dung does act injuriously, when it is used upon grass ploughed up for an oat crop. In this instance, the article under notice suggests that the injury is probably due, not to "denitrification," but to the ground "being mechanically kept too open to allow the proper development of the roots, and retention of moisture"—oats requiring a good supply of moisture at every stage. What is of importance is, the knowledge which these experiments supply, that the best of manures, artificial and natural, may not only do no good, but be positively hurtful, under certain conditions of soil or climate. It is only correlative to the experience in human beings, that what is food to one may be poison to another, and what is nourishing at one time may be fatally injurious at another. The conditions must be ascertained by experience, supplemented by science.

In regard to the use of basic slag—which is, we believe, also known as Thomas's Phosphate Powder, and which is obtained from iron ores rich in phosphorus, by the extraction of phosphoric acid and the simultaneous addition of lime—its success with wheat and clover has given it an immense reputation, and it is claimed that 50 bushels of wheat per acre, and two tons of clover are the certain result of the application of 6 cwt of basic slag, costing about 12s. in all. The *Guardian* writer states that inquiry has shown that these results have been obtained where the wheat itself, or the preceding crop, had received full dressings of common manure; while the clover was grown on certain special soils. Without in any way questioning the value of basic slag, whose richness in phosphoric acid, combined with free lime and

magnesia, makes it often an excellent manure, the writer under review refuses to admit that it has been proved to be a universal panacea. Experiment is the sole and final test to which all suggestions, whether emanating from a "scientific" or a "practical" source, must be referred; and in every case of "sovereign remedies" a trial is possible, by manuring a strip of a field, and leaving an adjoining strip unmanured. A few months will enable a comparison to be made by the eye and also by the weight or quantity of crop produced, and then a decision can be arrived at applicable to a large acreage.

BORER-RESISTING WOODS, RANAI, JARRAH, &c.

The Harbour Engineer, Mr. Bostock, has been expressing his opinion on the value of timber for the Harbour Works, and makes special reference to the durability of Australian Jarrah (*Eucalyptus marginata*) and the Ceylon wood known as Ranai. We give below some further information on this subject:—

RANAI or Yavaranaï (Tamil) is the Singhalese *Wewarai*; *Alseodaphne* (Persea) *semecarpifolia*, a tree belonging to the order Lauraceæ (the cinnamon family). Dr. Trimen thus refers to it in his Flora:—"Forests of the dry region, common. One of our best timber trees. The wood is exported from Trincomalee; it is heavy, durable, straight-grained, pale greyish-orange, and can be obtained of large size." W. Ferguson in his "Ceylon Timber Trees" makes mention of the tree referring to it as Raneë or grain wood and draws attention to the reports on the timbers of the Wanui and Batticaloa in yealy Dutch *Campendium* for 1789:—"This though long known as a valuable timber tree in various parts of the island, has only lately become of importance as a timber sent from Trincomalee to the Commissariat at Colombo. It is a common and gigantic forest tree near Batticaloa and Trincomalee, and is likely to become of considerable importance as a Ceylon timber tree of value for building and other economical purposes. It is of a light yellow color and said not to be liable to warp. Some specimens of it that I worked upon had the grain much confused; but in general it has a free straight grain and is easily worked. Logs of large dimensions of it can be procured from Trincomalee, it has been exported for some years past under its native name of Yaverne. Mr. C. A. Krickenbeek, who was stationed for some years at Batticaloa, informs me that the wood of the Raneë resist the attacks of the teredo and wood-boring insects, and that it is consequently much used in that district in the construction of boats, &c. I beg to offer my best thanks to Messrs. Morris and Saunders, Government Agent and Assistant, and to Captain Watson, of the Commissariat Department at Trincomalee, and to Messrs. Grinlinton and Birch of Batticaloa, for the very obliging manner in which they supplied me with specimens both in flower and fruit of this tree, besides useful facts, and which enabled me to thus identify the plant botanically. I am fortunate in having Mendis Mudaliyar's original dried specimen of this plant No. 95. 'Wea Waene' from the Central Province and called "Cratæva Roxburghii" and though not in flower, I have no doubt of its being identical with the tree now described. Wood used for house building and pestles,—Mendis. Excellent wood and much used at Trincomalee as a substitute for deal—Wright." Mr. Alexander, late of the Forest Department, says in his *Timber Trees of the Central Province* that the tree affords most excellent useful wood, which weighs 52 lb. per cubic foot. Another late member of the Forest Department, writing of the timbers of the Northern Province, speaks of Ranai as 'a common and frequently a very large tree in this

province, and has a reputation of being a very valuable timber on account (amongst other qualities) of its resisting the attacks of the teredo and wood-boring insects; however, this may be in other parts, it certainly is not true of it in this province as regards the attacks of wood-boring insects, as my own experience here is that the tree is very subject to such attacks. Only last month (October 1891) in felling telegraph posts, I found in 27 trees, 18 of them utterly useless on account of their being riddled with wood-borers. It is true that these trees were more or less suppressed trees, and perhaps, under more favourable circumstances they escape the attacks of insects. I have seen felled trees of 5 feet girth without defects. It is a good timber and extensively used for various purposes.'

In the "Ceylon Forester" for February 1895 occurs the following note about Ranai:—"It attains a height of 50 feet and seldom branches under 18 or 20 feet. Logs of 30 feet in length are not uncommon. It does not attain a very great girth, seldom if ever exceeding 8 feet in circumference. . . . The wood is a light brown, is much used in house building, and also for bridge planks. It realizes 90 cents to R1.12 per cubic foot. There is a large supply available for future use. Unfortunately it is very liable to be attacked when growing, by a beetle, the *knunimiyä*, of the Singhalese, which bores holes in it, and trees apparently sound are often found full of these holes."

In the Kew Bulletin (Nos. 82-83 of 1893) is published some correspondence with reference to the use of Jarrah timber for paving carriage ways and public streets. Among other letters is one from the Borough Engineer and Surveyor, St. Pancras, to the Royal Gardens, Kew, in which the writer refers to the experiments made by the Engineer-in-Chief of the Natal Harbour, which showed that the "Jarrah, Greenheart, and other timbers have all been more or less severely attacked by the worm, while the Madagascar timbers have been practically untouched." The Engineer of St. Pancras Borough, himself speaks of the destruction of Jarrah by borers, in his letter. Unfortunately the names of the Madagascar timbers referred to are not given.

It will be seen, therefore, that there is a want of unanimity among the authorities as regards both Ranai and Jarrah, the merits of which are being at present discussed.

What of PALU (*Mimusops hexandra*) of which Mr. Broun, the Conservator of Forests, says:—"Palu is very strong and exceedingly durable. I was informed that some piles put in at Mannar during the time of the Dutch, were taken out some six years ago, and were almost as good as when they were put in. The hardness of the wood, and possibly some essential oil which it contains, protect it from the attacks of the teredo."

I am sending specimens of Ranai and Palu wood." [But, is not the latter timber (Palu) getting very scarce?—ED. T.A.]

JAMAICA SORREL ("HIBISCUS SABDARIFFA.")

[This grows well in Ceylon.—ED. T.A.]

(From the *Florida Agriculturist*.)

The fact that my sorrel is blooming freely reminds me of a promise to say, through the columns of the *Agriculturist*, something of the methods of using it. In the first place then, the edible portion is the fleshy calyx that surrounds the seed ball. The pod itself is of no value and should not be cooked, but only the brilliant red husk that surrounds it. It is ready for use at any time after the flower has dropped a week until it begins to dry up as the seed ripens. After it is picked or cut from the bush take the pod, fruit or berry, or whatever you please to call it, between the thumb and finger of your left hand, stem end up, and with a knife cut off the stem and a little of the ball with it. This will enable you to easily remove

the expression of his desire to grant assistance, and for the interest he has shown in the matter from its inception,

Kandy, Jan. 1898.

SIR,—I am directed to inform you that the well-known Cryptogamist (Mr. J. B. Carruthers, F.L.S.) has been invited to Ceylon to investigate the cacao disease, and is now engaged in microscopic work on Wariapolla estate. This microscopic work is a necessary preliminary to gaining a full knowledge of the cause of the disease, and may occupy the cryptogamist some two or three months. When this work has been completed Mr. Carruthers will be in a position to make further investigation as to the means to be adopted for curing or preventing the disease.

Government have given a conditional promise, that they will defray half the cost.

The terms made with Mr. Carruthers are, that he should receive a first-class return passage costing say £100 sterling, and £200 sterling in cash for six months, and that should his services be required longer than six months, he is to receive £30 sterling per mensem for each month beyond the six months.

Should the investigation occupy twelve months, the total amount required will be R7,200, and this amount, it is proposed to collect by means of a guarantee fund, the amount actually payable by the guarantors, to be in proportion to the amount of their guarantee. The following sums have already been guaranteed, but if the full amount be subscribed it is expected that not more than half of the guarantee will be called up.

All information will be made public, and Mr. Carruthers will be prepared to visit estates belonging to subscribers, when his microscopic work is completed.

—I am, sir, yours faithfully, A. PHILIP,
Secretary to the Planters' Association of Ceylon.

61-62, Gracechurch Street, London, E.C., 26th Nov., 1897.

A. Philip, Esq., Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—I enclose for the information of your Committee, copy of correspondence in reference to the proposed appointment of a cryptogamist to investigate the cause of the disease under which the cacao trees have been suffering in Ceylon.

I may add that the Government having failed to do anything in the matter, Mr. L. B. H. Dickenson, who has been taken great interest therein, has accepted the responsibility of himself employing Mr. J. B. Carruthers, a gentleman most strongly recommended by Mr. G. Murray, the Keeper of Botany, at the British Museum (natural history).

Messrs. Dickenson and Carruthers leave London this evening to meet ss. "Himalaya" for Colombo, at Brindisi.—Yours faithfully,

(Signed) WM. MARTIN LEAKE, Secretary.

Ceylon Association in London, 61-62, Gracechurch Street, 19th October, 1897.

The Right Hon. the Secretary of State, for the Colonies.

SIR,—The Cacao Planters of Ceylon are, as you are aware, anxious that the services of a qualified cryptogamist should be engaged to investigate on the spot the disease, from which the cacao trees are suffering, now ascertained to be fungus.

The matter is stated by them to be pressing, as the next two months are the season when the fungus is most active.

I am to suggest that if no instructions have yet been received from Ceylon for the engagement of a cryptogamist, a telegram should be sent asking for them, as no time should be lost.

I am to add that two qualified gentlemen, have expressed their willingness to undertake the mission—Mr. John Parker, of Trin. College, Cambridge; and Mr. J. B. Carruthers, son of the late head of the Botanical Department of the Natural History Museum.

Prof. Marshall Ward can speak for the former, Mr. Murray of the Natural History Museum for the latter.—I am, Sir, your obedient servant,

(Signed) WM. MARTIN LEAKE, Secretary.

Downing Street, 23rd October, 1897.

Sir,—I am directed by Mr. Secretary Chamberlain, to acknowledge the receipt of your letter of the 19th instant, urging that a specialist should be engaged to enquire into the nature of the disease which has attacked the cacao trees in Ceylon.

In reply enclose for your information copy of a letter on this subject from the Director of Kew Gardens, and I am to inform you that in view of Mr. Dyer's recommendations Mr. Chamberlain informed the Governor, last August that he did not propose to send out a specialist to the Colony.—I am, your obedient servant,

(Signed) C. P. LUCAS,
The Secretary to the Ceylon Association.

Copy of Letter Referred to.

Royal Gardens, Kew, July, 31st 1897.

Sir,—Referring to your letter on April 21st last (8212/97) on the subject of a disease which has attacked the cacao plant in Ceylon, and my reply of April 22nd, following, I have now the honor to say that I have received from the Director of the Royal Botanic Gardens, Peradeniya, specimens from diseased trees which have been subjected to careful examination.

2. I enclose a report upon these specimens, which I think leaves little room for doubt that the disease is due to a fungus, the growth of which has been promoted by unsuitable methods of cultivation. I further enclose a memorandum by the Assistant Director as to the remedial measures which the circumstances suggest.

3. With this information before him, the Director of the Royal Botanic Gardens, Peradeniya, ought to be able to deal with the problem. I am not therefore prepared to recommend that a specialist should be sent to Ceylon as suggested by the Governor.—I am etc.,

(Signed) W. TISELTON DYRE,
Fred. Graham, Esq., Colonial Office, Downing Street,

Wariapola, Matale, December, 14th, 1897.

The Secretary of the Planters' Association of Ceylon, Kandy.

Dear Sir,—Referring to your conversation today on the subject for the Cryptogamist of the cacao, I write to ask whether you would consider it a good plan for circulars to be sent from the Planters' Association to the owners of cacao estates in Ceylon, asking them to contribute towards the balance of the cost of getting out the Cryptogamist, which is not paid by the Ceylon Government, which however is not certain yet although it seems probable. I proposed to ask the Ceylon Government to contribute one half of the cost and the Hon. Mr. J. N. Campbell, whom I saw today has promised to use his influence with Government to secure the same object we have in view. It has occurred to me to suggest for your consideration that a circular from your Association to the different owners of cacao, asking for contributions would come better than an application from a private individual like myself, and if you are of the same opinion and see your way to carry it out, I should be very much obliged.—I am, dear Sir, yours faithfully,

(Signed) L. B. H. DICKENSON.

Kandy, 15th December, 1897

L. B. H. Dickenson, Esq., Warriapola, Matale.

Dear Sir,—I am in receipt of your letter of the 14th instant, and in reply write to say that until the matter is laid before the Committee of the

Planters' Association at its next meeting in January, I do not think that I could officially move. Meantime I am disposed to suggest that you might keep me informed, by perhaps sending me a copy of your letter to Government, and any reply received thereto, for the information and guidance of the Committee in deciding whether the Planters' Association can, and if so in what way, best assist in the furtherance of your views.—I am, Dear Sir, Yours faithfully,
(Signed) A. PHILIP, Secretary.

Wariapolla, Matale, Dec. 16th, 1897.

The Secy., Planters' Association of Ceylon, Kandy.
DEAR SIR,—Referring to your letter of the 15th instant, I enclose copy of my letter to Government asking Government to pay half the cost of Mr. Carruthers' investigation of the cacao disease. I will also keep you fully informed of all that goes on, sending you a copy of any and all letters in connection with this subject.—I am, dear sir, yours faithfully,
(Signed) L. B. H. DICKENSON.

P.S.—I had an interview with the Hon. Mr. J. N. Campbell, in Kandy on the 14th instant, and he promised to press the matter upon the attention of Government.

Wariapolla, Matale, Dec. 16th, 1897.

The Hon. the COLONIAL SECRETARY, Colombo.

SIR,—Referring to my previous correspondence on the subject of securing the services of a cryptogamist from England for the purpose of investigating the disease affecting the cacao in Ceylon, and to the Hon. Mr. North Christie's communication with His Excellency the Governor on the subject, in March last I have the honour to inform you that as it appeared to be a matter of the first importance that the cryptogamist should commence his investigations before the heavy rains of October, November and December are over, when the disease of the cacao is most virulent the proprietors of Wariapolla and Suduganga met in London and decided to arrange with Mr. J. B. Carruthers, F.L.S., to proceed to Ceylon by ss. "Himalaya" which arrived in Colombo, on the 11th instant. It may be mentioned that Mr. Carruthers has the highest recommendation from Mr. George Murray, F.R.S. etc. Keeper of Botany, British Museum (Natural History) as a Cryptogamist, who is competent to investigate such a disease as we have in cacao and that Mr. Carruthers has also been lately employed by the Royal Agricultural Society of England, to investigate the disease in Larch and also the disease affecting Elm trees.

The terms on which Mr. Carruthers, agreed to visit Ceylon, are that he should receive a first-class return passage and £200 in cash for six months and that should his services be required longer than six months, he is to receive £30 per mensem for each month beyond the six months. For the reasons previously mentioned the proprietors of Wariapolla and Suduganga, viz Messrs. Fraser, Hutton and myself, have guaranteed the payment of the sums mentioned hoping that after Mr. Carruthers had arrived in the Island, His Excellency the Governor, might perhaps appoint Mr. Carruthers as Cryptogamist in pay of the Government or failing that, that perhaps His Excellency the Governor might be willing to pay half the cost and that the other half might be contributed by the owners of cacao estates. As since my arrival in the Island I have learned that the Secretary of State has voted the appointment of a Cryptogamist by the Ceylon Government, I write to ask whether His Excellency the Governor would be willing for the Ceylon Government to contribute half the cost, (say one hundred and fifty pounds for the first six months, and £15 for any extension necessary) of Mr. Carruthers' visit to Ceylon, the other half to be contributed by the owners of cacao estates. I don't think that I need urge the importance of the cacao industry to Ceylon, both to natives and Europeans alike, both as an adjunct to tea and as an easy cultivation and natives in the lower districts of the island nor the seriousness of the disease. All are well known to his Excellency. When not affected by the disease, cacao

thrives as vigorously as ever and with market prospects so much improved and with every prospect of better prices, it seems a thousand pities for so valuable an industry to be ruined by a disease, which for various reasons unnecessary to mention, appears to be capable of successful treatment at the hands of a Scientist, who seems so capable for his work.

I am, sir, yours obedient servant,
(Signed) L. B. H. DICKENSON.

Colonial Secretary's Office,

Colombo, 18th January, 1898.

Sir—I am directed by the Governor to enclose herein for the information of the Planters' Association, a copy of a despatch received from the Secretary of State and to state that should Mr. Carruthers' enquiry prove to be useful and beneficial, His Excellency will be prepared to propose to the Secretary of State, that Government should pay half the expenses connected with his deputation.

I am, sir, your obedient servant,
(Signed) H. WHITE, for Colonial Secretary.
The Secretary to the Planters' Association of Ceylon.

Copy of Despatch Referred to Ceylon, No. 370.

Downing Street, 26th November, 1897.

Sir,—I have the honor to inform you that since I wrote my despatch No. 352 of the 10th instant, I have been given to understand that persons interested in cacao planting, are sending out to Ceylon, by today's mail, Mr. J. B. Carruthers to investigate the cacao disease.

It was fully explained to Mr. Carruthers, when he called at this Office, that his employment being purely unofficial will not give him any claim to the Government appointment of Scientific Assistant in the Botanical Department should that post be created, although of course if he desires to apply for the appointment, his name would be considered with those of other candidates.—I have &c.,

(Signed) J. CHAMBERLAIN.
Governor, the Right Honourable Sir J. West Ridgeway, K. C. B., K. C. S. I., &c., &c., &c.

J. R. Martin for three estates, Yatewatte, Hilton and another	30
	R.
Mr. Beechcroft	100
.. .. .	100

The CHAIRMAN remarked that, in moving the adoption of the Report, he had only briefly to say that Mr. Carruthers came out under an arrangement with Mr. Dickenson of Wariapolla, and if they succeeded in obtaining the guarantee which they were endeavouring to obtain, any arrangement by Mr. Carruthers with Mr. Dickenson would pass to the Planters' Association. He then moved the adoption of the Report adding that that meant that circulars would be sent to all cacao planters and superintendents they could discover.

The report was adopted.

This concluded the business of the meeting and a vote of thanks to the Chairman proposed by Mr. W. D. Gibbon terminated the proceedings

isfactory to them on this occasion if payment was limited to out of pocket expense incurred in connection with the business to the Company.

PLANTERS AND THE SOUTH OF INDIA RICE TRADE.

INDIAN AND CEYLON RAILWAYS COMPARED !

The party consisted of Mr. James Ryan, Mr. A. M. Forbes, Mr. G. C. Bliss, Mr. A. M. Carmichael, and Mr. P. F. Ryan of Ceylon Planters' who went to Southern India to see what prospects there were of inducing rice-growers and dealers there to take advantage of the new rates of through traffic to Ceylon devised by the Southern India Railway, and also what the feeling was on the proposal that the said dealers should send rice direct to Ceylon estates, instead of forwarding the same to Colombo Chetties, have returned to Colombo and Mr. Ryan, speaking to the representative of the local "Times," said:— Their position was that the Southern Indian Railway had reduced their rates for carrying rice enormously, speaking of the journey he said:— "The charges are exceedingly moderate—you get tiffin or breakfast for a rupee; dinner for Rs 1.50, and drinks are in proportion—all very much cheaper than you get in the Railway Refreshment Car in Ceylon. The same beer you get here—(Beck's)—at 75 cents a bottle you can buy up there—300 miles in the interior of India—for 56 cents; you can also get baths in the railway stations practically for nothing. You can stay at a station for a day, and you are only charged the small sum of 50 cents or a rupee for occupation of the station, use of bath and everything. Then, on the train, they gave us a special carriage all to ourselves, and in this carriage there was a servants' compartment, where our boys could cook anything for us that we liked, and also we were given the privilege of breaking our journey anywhere we pleased. We had only to give the word, and we could be run into siding and disconnected at any station—and in fact it was railway travelling under the most pleasant conditions—practically we could stop where we liked, and then when we went on we had only to, as it were, step out and whistle for the engine.

They visited Trichinopoly and at Negapatam their real business began. They arrived on Sunday morning, and had an interview with the Chetties and leading rice-merchants gathered in conclave. Captain Shelly was not with them then, but Mr. Mercer, of the South Indian Railway, accompanied them. Mr. Ryan's party showed the rice-dealers the samples of the rice Ceylon requires, and the Chetties showed them samples of what they could supply, and, in spite of the name that Negapatam has as the head-quarters of the sea-borne trade, the dealers pointed out that, owing to difficulties of navigation in the North-East monsoon, the through-looking system to Tuticorin would pay them to use, in fact it was particularly attractive for them as far as the North-East monsoon was concerned, though in the South-West monsoon they thought the native boats would do the work cheaper. They also expressed their willingness to deal directly with Ceylon planters on certain lines which the visitors laid down, so as to do away with any connection with Colombo dealers.

AT TANJORE AND CUDDALORE.

That night the party dined at Tanjore, where they did all the sights, and they also had a

very large meeting with the rice merchants and growers in that district. "Our interview was very long and full," said Mr. Ryan, "and embraced every possible point, and the rice-growers expressed themselves as quite ready—in fact, anxious, to deal, and at rates which would certainly be remunerative." Next they went to Cuddalore, which is the farthest station on the line to which the through-rates have been extended. There they saw only one merchant, whose ideas of business were exceedingly vague. After they left, some 500 bushels of rice were offered them for sale from this place—the offer being wired to them, but they were at rates quite impossible to touch. The only satisfaction the party got at Cuddalore was from an oyster feast. Cuddalore is a sort of Indian Colchester in this respect; there are splendid oysters and they are very cheap. They paid 15 annas for 250, and then heard later from experts that they were swindled, as the ordinary rate is only annas 4 per 100.

SATISFACTORY INTERVIEWS.

Next they journeyed to Shiyali, where they saw rice-dealers, and a large grower—a man owning some 3,500 acres of land, who spoke English fluently and does business already with Colombo direct. He was able to give them a very valuable series of figures, showing his prices for rice for the last five years, and on the whole this was the most satisfactory interview they had. After Shiyali they travelled to Dindignl, where they saw some more cheroot manufacture going on, and they returned *via* Madhura to Tuticorin, which they reached yesterday morning. There they interviewed and discussed the matter of finance with the banker, and they also interviewed a gentleman who is

PREPARED TO TAKE UP THE EUROPEAN AGENCY at Tuticorin. Then they rejoined the "Katoria," and they had a very rough passage in the steam launch out to her anchorage. This launch belongs to Messrs. Adamson and McTaggart, and the party unanimously vote it a disgrace. Said their spokesman: "Seas come over it; it is very insufficiently protected from the weather, and the coolies who came out by it all got wringing wet."

THE TREATMENT OF COOLIES AT TUTICORIN.

"There is a great deal left to be desired in the treatment of the coolies experience at Tuticorin jetty," said Mr. Ryan further. "We saw a gang of some 15 coolies turned back from the pier-head on the jetty who were said to be too late, but who, to our knowledge, had been there the best part of an hour—and they were sent back three-quarters of an hour before the launch started, and though there was ample room for them on it. Thereby they were exposed to all the evils of another day's extortions from the blackmailers at Tuticorin and the seductions of the crimps. We also heard that crimping and extortions are not confined to men of the town of Tuticorin, for the launch men have been known to have levied black mail from them. There is also a charge for luggage on the launch—50cts. a package which is excessive for the work done, because a ton of ordinary goods are taken in a lighter for the same price." Then the party had a very rough passage back to Ceylon.

CONCLUSIONS.

"In the main," Mr. Ryan concluded, "we are of opinion that when rice reaches a normal price in Southern India (which it is not at present owing to the abnormal season) there is no doubt that business can be done on the through-looking

system, with profit to the grower and the buyer in Ceylon. In spite of the scarcity, 25,000 bags of rice have already been booked over the rail during the past two months under the new rate, by cultivators and dealers,—this information we got from the Railway authorities. We went over, I may say, at a bad time; we ought to have waited awhile till the March crop is coming in. Then there may be a larger lot sent in this way. Even now, more might have been done had it not been that the dealers now had only small bags mostly in stock, which did not allow of their getting the full advantage of the concession. The ordinary bag in use at present appears to be one of 25 markals, whereas the rate calculated by the S. I. Railway is for a bag of 27 markals. Rice, I may add, is carried on the S. I. Railway at a rate that works out at about

ONE TENTH OF THE CEYLON RAILWAY RATE.

“Coolies also travel on the line cheaper than they do here—they pay only a cent a mile—in fact, the Ceylon Government Railway has many tips to learn from the South Indian Railway. All their shunting is done far quicker and far quieter than it is here, and their general management is better—yet there are no European guards, no European Station Masters, no Europeans on the line at all; but every man seems to put his shoulder to the wheel to get a train out of a station quickly, and, though we travelled over some thousand miles of the railway, and stopped I don't know how many times, on no occasion was the train five minutes late on schedule time in getting to a station—in fact I might say two minutes. And this is a single line and metre-gauge! We had nine days' incessant travelling on the line, and never knew a train two minutes late.”

The report of the party will be laid before the C. P. Association at its meeting in February.

RUSSIA AND CEYLON TEA.

Mr. J. Findlay, who arrived here a few days ago from China, has come with the object of arranging for the establishment of an agency here for exporting Ceylon tea to Russia. He is a representative of Messrs. Molbhanoff Peachatnof and Company, the largest firm of tea-buyers for Russia in the North of China, and proposes to open the branch here on the 1st of March, the tea-rooms and offices being on the same premises as Messrs. Bois Brothers in Queen Street. The agency will—the “Independent” says—be managed by a Russian gentleman at present in China, while a tea-taster will be got out from the firm of Messrs. Travers & Son in London.

THE TASTE IN RUSSIA.

Ceylon tea is increasing in popularity in Russia, and is gaining more favour with the Russians. But this, of course, is due not so much to any particular liking the Russians have for Ceylon tea, as on account of its strength and usefulness for mixing with China tea. The taste in Russia has of late considerably changed, and whereas formerly they preferred light-flavoured teas, they now want teas with more strength.

THE USE OF MACHINERY IN CHINA.

A new company is in process of formation in Kankow under the auspices of the Imperial Maritime Customs, to make teas with a certain quantity of machinery in the Ceylon style. In the attempt proves successful, as we have no doubt it will, it will lead to the introduction of machinery generally in China.

Mr. Findlay does not appear to be a believer in the Sirocco. He thinks the Chinese system of firing is infinitely preferable,

CEYLON AND CHINA TEAS.

The unpopularity of China tea in some quarters is chiefly owing to the fact that the tea is manufactured by hand, whereas if machinery were used a greater degree of cleanliness could be attained. In this particular Ceylon tea has a grand advantage. But although so much has been said about the uncleanness of China tea there are some people who are inclined to the belief that the ideal of such uncleanness is purely a myth. If that is really so, the question will be merely one of taste. Mr. Findlay is under the impression that the secret of the strength of Ceylon tea as compared with China lies in the withering and fermentation. He is a strong believer in that if the Chinese do ever adopt Ceylon methods, they can make teas that will have all the strength of Ceylon teas, and yet retain all the softness peculiar to their own teas. But when the Chinese will do that is quite another thing!

RUSSIAN HOUSES IN CEYLON.

It is probable that two more Russian houses will be established in Ceylon in the course of the present year. Mr. Findlay has a peculiar liking for China tea, but it is not a matter for surprise. He has been associated with the tea industry in China for the past 26 years, and his taste for tea must naturally have been trained towards China.

PLUMBAGO IN MADAWALATENNA.

We learn that Captain Leonard Tregray has opened up some very fine shows of plumbago on Monerakande estate, which the proprietor (Mr. Tottenham) hopes to turn to account in due course. The deposit appears to be extensive, and of the best quality for the most part.

CACAO DISEASE INVESTIGATIONS.

(From Proceedings of the Ceylon Planters' Association, held 31st January, 1898.)

The next business was to receive an interim report of the Sub-Committee on cacao disease investigation, and the report which was read by the Secretary was as follows: “The Sub-Committee having considered the annexed correspondence in reference to the appointment of Mr. J. B. Carruthers, F.L.S., as Cryptogamist to investigate the cause of the disease under which the cacao trees are suffering in Ceylon herein report progress, and recommend that all cacao proprietors—whether Companies or individuals—be invited to contribute to a guarantee fund for the purpose of defraying the expenses of the Cryptogamist. The total sum required to be guaranteed may be placed at R7,200, and it is hoped that the sum will be at once subscribed. Your thanks are due to Mr. Wm. Martin Leake, Secretary, Ceylon Association in London for assistance, on the suggestion and representation of Mr. L. H. B. Dickenson for the assistance in the initial steps, and who ultimately succeeded in finding a gentleman of Mr. Carruthers' qualification. Your thanks are also due to the proprietors of Wariapola and Suduganga, for their enterprise and public spirit in at once securing Mr. Carruthers' services. The circular letter appended to this report addressed to all cacao growers explains in some detail the manner in which it is proposed to make Mr. Carruthers' services, and the results of his investigation available so as to be generally useful. Your acknowledgments are further due to His Excellency the Governor for

THE CEYLON FISHING CLUB.

We direct attention to the annual Report of this institution below, which contains details and informations of special interest to anglers and to all concerned about the successful acclimatisation and propagation of trout in Ceylon. The Committee and Secretaries have had a very trying experience last year: but there is much encouragement to persevere and the fact that trout have been caught up to 1, 2, 2½ and of 3½ lb. weight shew results already attained one of great value. As to spawning, it is rightly mentioned that it took ten years before success was attained in this respect in New Zealand rivers. What is wanted now is that some angler of experience and leisure with a proper love of natural history should settle down in Nuwara Eliya and study the life history of the trout in our highland streams.

ANNUAL REPORT.

The following is a copy of the official annual report of this Club:—

The last annual meeting of this Club was held on September 12th 1896, when a report was read by the then Hon. Secretary, Mr. Lushington. Subsequently three meetings were held; one on December 23rd, 1896, when the usual election of office-bearers for the ensuing year took place, and the accounts of the Club up to that date were laid on the table. A second meeting was held on March 1st, 1897, to discuss the distribution of the fry; and a third meeting was held on September 25th, at the request of several members, when a preliminary report was submitted by the Hon. Secretaries, the accounts up to date were laid on the table and passed, and the arrangements as to ova for the next hatching season were discussed.

During the year the following rules were altered or amended:—

In Rule 1 page 2 the word was "person" deleted and the words "resident in the island" were substituted for it.

The following words were added to Rule 11:—"Sufficient notice of such proposed alteration or amendment shall be given to the Honorary Secretaries to allow them to give each member of the Ceylon Fishing Club ten days' notice before the General Meeting of such alteration or amendment."

Rule 3. That licenses to fish for trout by non-members of the Club shall be at the following rates:—

One day	(a)	R 12:50
One week	(b)	" 25:00
One month	(c)	" 75:00
The whole season	(d)	" 120:00

Rule 5 Sec. (b) was altered to read thus:—They shall at once return to the water all trout accidentally caught.

Rule 7. The words "subject however to the exception contained in Rule No. 5" were expunged.

It will in consequence be advisable to bring out a fresh edition of the C. F. C. rules.

It was also decided to keep on the present keeper, who has done good work during the year in watching the local streams and lakes, preventing poaching and prosecuting offenders, and to employ in a similar capacity the Resthouse-keeper Horton Plains, and the Pattipola Resthouse-keeper.

The fish-register kept at the Horton Plains Resthouse having proved successful and interesting, it was thought advisable to start similar books in Nuwara Eliya; and the Grand Hotel, the Club, St. Andrews and Keena Cottage have each been supplied with one. It is hoped that fishermen will help the Club by entering them up carefully.

The Horton Plains register shows that 384 fish were caught by members between February 15th and August 22nd, of which 216 were under 11 inches and were returned to the water. The largest fish taken was one of 3½ lb caught by Mr. A. T. Cathcart, while eight fish were caught between 2 and 2½ lb.; 70 between 1 and 2 lb; and 89 between ½ and 1 lb. Un-

fortunately there is no register of fish caught in Nuwara Eliya, though it is hoped that this will be remedied by next year.

The alteration of the dates of the close season has been discussed, but no definite conclusion has yet been arrived at. It is a difficult question, on which everybody differs. The fact is we none of us know much about the breeding habits of trout in these waters, and the alteration in their habits caused by change of climate, food, etc., because we are most of us busy men who have no time to devote to the close daily observation necessary for such a study. A leisured man, with previous experience, who would take up the matter as a hobby, would be a real godsend.

Two stew-ponds were made early in the year, one by the kind permission of H.E. the Governor, in the grounds of Queen's Cottage, and one under the superintendence of Mr. Farr, at the Horton Plains. It is too early yet to pronounce whether they are a success or a failure. Fry were supplied to each, but the Horton Plains pond was seriously affected by a heavy flood. The Queen's Cottage pond has been undisturbed, and it will be dragged early next year, before fresh fry are put in, to ascertain how the last year's fry have fared.

A great many female trout full of spawn were sent to us for inspection by the fishermen who caught them in July and August, but hardly any males were caught then with signs of milt in them. Every effort was made to discover signs of fish working up towards the headwaters in pairs, or of females depositing eggs in the sand, and the removal of sand and rubble from the upper parts of the streams was prohibited for several weeks, in order to keep the waters as undisturbed as possible; but it cannot be said that so far there are any certain proofs that the trout are spawning in the Nuwara Eliya streams. An experienced member; the former Hon. Secretary of the Club, is of opinion that they never will, and that our one hope of spawning lies in the Horton Plains streams. On the other hand our streams here are not much warmer than, or very different from, some of the streams in New Zealand, where it took from 10 to 12 years before the fish would spawn; and the power of adaptation to environment, latent in all animals, trout included, is well worth waiting for and endeavouring to encourage.

THE OUTTURN OF FRY.

Under this head, the year's record has been disappointing to the verge of disaster. Forty thousand ova were ordered out at the end of 1896 from the usual source—the Surrey Trout Farm of the Messrs. Andrews. They arrived in two batches, in January and February. Every possible precaution was taken to ensure their immediate delivery and rapid transport to Nuwara Eliya. The hatchery and trout house were in excellent order, the latter having been doubled in size. Unfortunately Messrs. Andrews experienced great difficulty in finding properly appointed ships to carry the ova, and, in order not to miss the dates, they shipped them by vessels where there were no proper cold rooms and no sufficient store of ice. Nor were the boxes left undisturbed, but had obviously been turned up on end and shifted about ruthlessly. The result was that the first batch was ruined and the second very nearly so. The eggs, when unpacked, instead of lying flat, were found crushed together into a horrid mass of corruption, and it took many hours' hard work, day and night, to extract the possible survivors. These, however, were so hopelessly affected by the corruption of their neighbours, that fungus set in almost at once, and spread with fatal rapidity, so that eventually only 1,596 fry were hatched, and were distributed as follows:—

- 200 to Ambewa Oya.
- 100 to Queen's Cottage Stew-pond.
- 396 to Nuwara Eliya Streams.
- 400 to Buluhala Oya and Kurundu Oya.
- 500 to Horton Plains Streams and Stew-pond.

It is a disappointing result, but it is as useless to cry over spilt milk as over spoilt ova. Messrs. Andrews reduced their bill by about 1/3rd, and

have promised to be more careful in future as to shipping the eggs; and it is hoped that arrangements have been made as regards the coming batches, which will prevent the recurrence of such disasters. It may be some slight comfort to know that we are not the only Club that has to face such disappointments, for the annual report of the Nilgherry Game and Fish Association has a very similar tale to tell, and even heavier losses to deplore. If it were necessary further to prove that "the best-laid schemes of trout and men gang oft agley," two slight incidents might be mentioned which confirm the theory. As it was an abnormally warm season when the ova arrived, we telegraphed to Colombo for ice, to lower the temperature in the filter boxes. It arrived packed in kerosine tins! and so impregnated with oil that none of it could be used. Again, about forty of our few surviving fry suddenly died in 24 hours, of no perceptible cause except a small red spot on the gullet. A careful search through the troughs disclosed the presence of three or four leeches, and if these were really the cause of the loss, another terror is added to the troubles of tropical trout breeding.

FINANCE.

The financial condition of the Club is quite satisfactory. After paying for the unlucky ova, and meeting two abnormal and heavy charges, the rebuilding of the hatchery and the making of the Stewpond at Queen's Cottage, the balance to our credit today is R1,230 91. Our income has steadily increased both in the way of subscriptions and licenses, in spite of the manifold claims upon the purse during Jubilee Year; and, as far as one can judge, the average fisherman finds quite enough sport to justify his expenditure.—S. M. BURROWS, J. WICKWAR, Hon. Secretaries.

The accounts from October 1st, 1896, to November 30th, 1897, showed the receipts (including a balance of R1,213 58 from last year's account) to be R4,459 31 and that after meeting payments there was a balance of R1,258 66.

COFFEE PLANTING IN COSTA RICA.

Report of proceedings at the First Annual General Meeting of the Sarapiquí estates Company, Limited, held at the Terminus Hotel, Cannon Street, E. C. On Tuesday, December 21, 1897. Mr. Gilbert D. Jennings in the Chair.

After the notice convening the meeting had been read by the Secretary, the CHAIRMAN said: In calling the attention of the Shareholders to a few more details than are given in the Report, I will begin with the Accounts that we have before us. I am happy to say that all the calls up to the present date on our Shares are enashed. I wish also to explain the amount of £3,000 due to the Vendor for purchase money retained in hand. That sum is retained in hand to cover certain liabilities of the Vendor for advances made to him, and for taxes on the Estate. It probably will be cleared at an early date. The amount of the Bills Payable seems large, £2,850, but they have all been since paid, and I think I may state that the company is without any liability whatever, beyond those of a trivial kind. On the credit side, the item development Account demands a word or two of explanation. The Development Account may be described as money laid out on the working plant of the Estates, such as machinery, water power (I am thankful to say that there is no prospect of our needing any power but the water power which lies close to our own doors), pasture ground, and certain other matters connected with the Estate, including road-making. Labour Advances and other Balances in Costa Rica amount to £2,985 2s 11d. These are advances made to labourers. It is the custom in Costa Rica to secure labour by means of advances, which are worked off in one form or another, but principally in labour given to the Estate. The system is an advantageous one, and this account will reappear in the Balance Sheets year by year presented. The next item, I am glad to say, is the most satisfactory that we have on our Accounts:—Produce in Hand

(since realised), £186 3s 6d. The Accounts deal with only 8 months, but already we have produce which we can point to as realising the expectations held out to the Shareholders in the prospectus. We have saved and secured under disadvantageous circumstances a certain quantity of the crop of last year, we have brought that quantity to market, and have realised for it a high price. The highest price for the best coffee is 108s, the average is 96s. and we, the Directors, may well congratulate the Shareholders on having in their first accounts such an item as "Sales of Produce."

We pass to Old Cultivation expenses. In order to keep the estate going, and to secure the small amount of produce that was brought to market last year, we had to lay out the sum of £330 0s 5d. From this is deducted the amount realised for produce here, £186 3s 6d. There is a small balance of produce now in Costa Rica to be realised, and the amount which we stand to lose (if we can call it losing) will be probably £50 or thereabouts; so that we shall have recovered within a very small amount all that we have laid out on our property before we come to actual profitable working. I venture to submit this is a very satisfactory state of things in the inception of a Company like ours.

With regard to New Cultivation Expenses, the sum under this heading will be charged against our next crop, incoming within a few months, and now being gathered. The Administration Expenses have been kept as low as it is possible to keep them. I would only remark on two points: one is that the salary of the Manager has not been fully drawn, in fact a very small amount up to the present date has been paid on account of it. The Directors have drawn absolutely nothing up to the present time. They do not intend to work for nothing and it is their intention to draw £250 on account of the £500 which stands, as you will observe, on both sides of the Account, leaving the remainder over. It is necessary to put this amount of £500 in the account, but I wish to call your attention to the way in which the Directors propose to deal with it.

There is only one other item in the Account, viz., Preliminary Expenses. These are the expenses which have to be debited to account of the formation of the Company, consisting principally of Brokerage on the Shares. Our company was not advertised, and no promoter had to be paid. I think you will agree with me that this charge is reasonable.

Passing to the Report, we are glad to find that the acreage already being coffee, 128 acres in the prospectus, has remeasurable to 144 acres—a small gain. Since the company has been formed some 400 acres have been taken in hand and partly planted with coffee. It was the intention of the Board at first to realise the company's Estate in many other directions beside coffee, but this intention has been modified by their subsequent consideration of the circumstances. It has been found that our capital is only enough to provide at present for cultivation. The profits from coffee lie close to our hands. The other profits, enticing as they may be, from the cultivation of rubber and tobacco or the realisation of Timber, are more remote, and as business men we consider that every fact before us leads in the direction of seeking our profit at present from coffee, and coffee alone; and we submit this to the shareholders believing that they will approve our plan. The history of the company I need not refer to; it was formed from a small Syndicate which subscribed its money and has been repaid in Shares of the concern. Mr. Shand, to whom the Meeting will have the pleasure of listening directly, visited Costa Rica, and was so impressed with the value of the property that he expressed his willingness to join the Board. We received him with great pleasure, and we have looked upon him as our main stay in planting matters. Mr. Rothe felt for Costa Rica in February, this year. When he arrived in Costa Rica he had all the legal business of the concern to do; the transfer of the titles, the translation of Documents, and the Registration of the Company. It is hard to see what work it was possible for him to do

on the Estate before May; however, he *did* work on the Estate before May, and you will agree with me that from the time of his first reaching Costa Rica up to the 31st of August, he has done a considerable amount in the development of our property. He has erected a water wheel in order to secure the water power. He has set up saw mills for the Timber, and for building the dwellings of the labourers; he has weeded the land; and he has felled a large quantity of new land, and begun to clear it. I think we must congratulate him on what he has already done. The future of the Company will receive the constant and vigilant attention of the Directors. To get the Accounts into a proper form so to be intelligible to English people has not been altogether an easy matter. They are kept with great accuracy according to the method of Costa Rica, but the method of Costa Rica and the method of England are not quite the same thing. So much has this pressed on the attention of the Directors that they have invited one of the body, Mr. R. P. Macfarlane, to visit the plantations, and he will start next month, with a view to getting the affairs of the Company focussed in such a way as that the Directors first, and the Shareholders after, shall be able to tell at a glance exactly how our plantations stand at any one moment. The Directors have felt sometimes a little regret at the delays that belong to planting enterprise in this new land. Costa Rica is a place of large profits, but it is a place of large delays and of enormous difficulties. Here in London, and in England generally, there have been people who have occupied our places before us, and we have entered into their labours. In Sarapiquí the reverse obtains; there has been nobody before us there, and we have had all the difficulties of pioneers; but these are being gradually, steadily and economically surmounted, and I have no hesitation whatever in commending to you this Report and Accounts, and asking that they may be received and adopted. The motion will be seconded by Mr. Shand.

Mr. J. L. SHAND: I have pleasure, Gentlemen, in seconding the adoption of the Report and Accounts. The Chairman has gone very fully into these matters, and I need not follow him into the details, but there are one or two things to which I should like to refer. In the first place neither myself nor my colleagues are altogether satisfied with the form which these Accounts take. We have been very much pressed for time to fulfil the conditions required to hold our General Meeting, and we have had difficulty in bringing the customs of Costa Rica into conformity with those customs which I myself and my colleagues, who have been on the Boards of other Companies with similar objects to this, consider absolutely necessary and indispensable. We shall as soon as possible get these things into the form which we consider desirable, and I can only say that the object of your Board, so long as it is constituted as it is at present, will be to put everything before you as plainly and straightly as possible. The Report is called an Annual General Report, but the actual transactions which are recorded extend only over the last quarter of the year under review, because the first two or three months we were busily engaged in the re-formation of the Company, which you will remember, and which I need not refer to further, but which resulted very much in favour of the Shareholders; in the second quarter we had considerable delay in the legal technicalities which had to be carried out in Costa Rica—translations, and various other works—in connection with the many things which had to be done before we got a title to the land; therefore, the actual working referred to in the Account is only over a period of three months, and I think we can say that in those three months we have made a very fair start. The labour has been organised, which is always a great difficulty when you go to a comparatively new part of a country; and I feel very certain when we have the pleasure of meeting you again we shall have a tale of much greater progress to tell. As I have had an opportunity of visiting the Estates it may not be out of place here

for me to tell you that I endorse every word which appeared in my report, which you probably all had the opportunity of reading, and that is, that we possess a very magnificent property, in fact we have a very large area of land capable of producing Coffee of the very highest quality, and we have proved that it is of the highest quality by the sample sales which appear in the Accounts. We have land capable of producing Cocoa, Rubber, Tobacco, and in fact all other tropical products, and although we do not embark upon these at present, we do not lose sight of them, and I am in great hope that we shall soon be able to tell you that we see our way to the development of some of these things. In the meantime our resources are limited, and it is desirable that we should make use of those resources and the energies of our Manager to bring something to market as soon as possible. It is for this object that we have for the present confined ourselves to Coffee. The natural advantages which our land possesses are very great. We have a magnificent soil and a splendid climate—a climate which is not only suitable for tropical agriculture but which is a pleasant climate for labourers to dwell in—European or otherwise. We have an abundant rain-fall. We have well-watered lands with streams which we can utilize for our machinery all over it, and the natural advantages are very great; but at the same time there are other factors which might nullify these natural advantages altogether if we cannot secure them. One is a sufficient supply of labour, and another is means of transport by which we can get our requirements up to our Estates and get our produce to market easily. I think the labour difficulty, which I always looked upon as a thing we would have to face, is likely to adjust itself, and it will be for our Co-Director when he goes out, to see whether the supply of labour is sufficient, whether it would be desirable to import labour from some other part. With the advantages we have, with the good climate and the opportunity of giving constant work to labourers, I have no doubt we shall be able to secure all the labour we require. One other point is the means of transport. The President, who is a gentleman of the very highest intelligence, and who I am very glad to think has got a new term of office, I had a long interview with him on the subject. I ventured to point out that it was the duty of every civilized Government, if it wanted to take advantage of its waste land, to provide means of communication for pioneers who embarked money in those lands. He received me very kindly and talked very favourably on the subject, and he told me that a very considerable sum, 50,000 dollars, had been granted for the improvement of the road that leads to our property. When our Co-Director goes out, it will be his duty to impress upon the President that it will be impossible for us to carry out what we hope to do if we do not have assistance in getting means of communication either by road, river, or railway (and we have all these three strings to our bow) to enable us to bring our produce to market. My friend Mr. Macfarlane, who joined this Board at my special request, has had a very long and, I am happy to say, a prosperous experience of Coffee planting, and planting of other tropical products as well—exactly the experience which we want to commend in the management of our property out there. He has the hearty co-operation of all our Board, and we all attach the greatest value to his visit to Costa Rica. With these words I will second the adoption of the Report and Accounts. I am sure that in answer to any questions you have to ask we shall be glad to tell you all we know.

Mr. C. N. P. PHIPPS:—I think we who are Shareholders have good cause to congratulate ourselves on the very satisfactory speeches that we have just listened to. If anything can be said to be certain of success in this world it looks really as if this Company, in which we are all interested, has a more than fair prospect of success and, let us hope, ultimate profit. I should just like, if you will allow

me—in no hostile spirit, I hope you will quite understand—to ask a few questions about the Accounts. Would it not be advisable to open a special Development Account in the same way as it is generally opened in other industrial concerns—a Capital Account, call it Development Account if you like—but have it set out by itself. Then there is another account that is also a very useful account, which I think may be worthy of consideration, and that is a Revenue Account. I may be told that unless we make a profit or actually make a loss a Revenue Accounts is not of much value. I think it would be a satisfaction to the Shareholders if we could see, and not have to wade through the accounts, what revenue is coming in each year. In the way of revenue there would be of course the coffee that we sell; and then I understand either the Chairman or Mr. Shand to say that there was a good deal of timber cut upon the land that we are now beginning to cultivate. I should like to ask: is that timber saleable timber or is it not? Of course one knows that there is a great deal of very valuable timber in Costa Rica, but at the same time one can quite understand that the timber may not be of a very valuable description. Then I should like to ask whether the sundry assets in Costa Rica, the live stock, the carts, the implements, were taken over with the property, or whether they were things that were bought afterwards, and whether that really belongs to the Development Account? I understood the Chairman to say that he did not consider perishable things as part of the Development Account? I understood the Chairman to say that he did not consider perishable things as part of the Development Account. Might I ask (I do not know whether it was that I did not follow it) whether the general expenses in Costa Rica, £396 11s 4d., are abnormally heavy, and if we could have some idea of what has constituted the amount of £396 11s 4d? I heard the statement that was made about the Directors' fees with a good deal of pleasure, and I want here to endorse, and fully endorse, the Chairman's remarks, "that the Directors are worthy of remuneration." I am sure that none of my brother Shareholders in this room would wish that the Directors should work for us for nothing. When I saw the accounts I noticed that the Directors' fees were on both sides of the Account, but I was rather startled at the idea of our having to pay such a very large amount as £750 a year; but that has been explained by the Chairman, and I am sure that, speaking not only for myself but also for my brother Shareholders, we appreciate extremely the feeling which has prompted the Board to recognise what our situation is.

Mr. WHITBREAD:—Mr. Chairman, I should like to ask one question. Have the Directors been able to make up their minds or to forecast at all what it costs per acre to bring this land under cultivation, and to what extent does the present capital of the company enable us to go in the way of coffee planting? I quite agree with what the Chairman said; it is advisable at present to give our first attention to that. I should also like an assurance (I suppose it is hardly necessary to ask it) that the assistant who goes out to the Manager in Costa Rica will devote his immediate attention to getting the accounts in really proper order.

The CHAIRMAN:—Gentlemen, first in answer to Mr. Phipps, as to a special development account. I think the Board would probably like to confer with him. It is not very clear to my own mind at the moment what is intended. Capital account is always a little vague, and for that reason we chose development account, because we thought it best described item No. 2 on the credit side; but these headings are always subject to extension and to further division. The item in question is, as I before remarked, for fixed plant; and I think it will be dealt with, and worked off by depreciation year by year, and so brought into revenue account. Item No. 3 (Sundry Assets) are what I ventured to call wasting assets, such as live stock, carts, implements, &c. I think it

would be dealt with in rather a different way, when it is ascertained how much will be required by the company of this kind of material. When it is in full working, the stocks carried forward will be treated as capital, and so the year's purchases will roughly correspond with depreciation, and will pass the revenue account. I understand that is how it will be dealt with.

Mr. PHIPPS:—Is it what was found on the ground—part of the vendor's stock?

The CHAIRMAN:—The whole of the goods under Item No. 3 (live stock, carts, implements) are new and purchased by the company; as far as I can understand we have taken over little or nothing of what was there before. I think I am right, Mr. Shand?

Mr. SHAND:—Yes.

The CHAIRMAN:—Mr. Phipps called attention to the absence of Revenue Account. There is no such Account, because up to the present there is on Revenue beyond £186 3s 6d. The Revenue Account will be built up of Items Nos. 5, 6, and 8. No. 5 is produce in hand, No. 7 is old cultivation expenses, and No. 8 is new cultivation expenses; and of those three, with drafts from the other accounts, will be built our Revenue Account. When we next have the pleasure of meeting you, we shall have, I hope, a Revenue Account, and shall present it in proper form. The question about the timber, whether it is saleable or not, comes next. In this country we have an idea of turning everything into money, and Timber, we think, is a very valuable thing if brought to market. In Costa Rica I understand (but Mr. Phipps knows better than I do) they have a different way of dealing with the Timber. They allow it to rot on the ground, and make the manure or fertilisation for their coffee estates; and so extraordinary is the vitality of the vegetable and animal creatures that assist this fertilisation, that in a very short time these huge trees have become fertilising material and passed into the ground, so that it is a matter of consideration with the manager whether he can realise his timber as timber, or whether it is better to lay it along in lines on the ground and leave nature to do the rest and bring it into the soil. I am not able to say whether we have any quantity of saleable timber; I should think we have not, but as soon as we have we shall sell it. The other question of Mr. Phipps related to the item "General Expenses," which appeared as £396 11s 4d in Costa Rica. I say candidly that the Directors have not all the dissection of that item that they would like to have, but they have written for it, and it will come. At present it appears justified by the heavy expense the Company was at for translations and other preliminary work. The whole of this great body of Articles of Association had to be translated into Spanish and filed in the Government archives, costing a great deal of money; and this and other preliminary expenses in Costa Rica account for the large figure.

Mr. PHIPPS:—Might I ask one more question. Are we likely to be called on to expend very much more money on the roads?

The CHAIRMAN:—Mr. Shand has answered that as far as we can answer it. At present we know that the money is voted by the Chamber for the purpose of hardening our road, and all the influence we can bring to bear will be used in getting that money devoted promptly to the road.

Mr. PHIPPS:—I take it 50,000 dollars will not cover it. We shall have to make up some ourselves.

The CHAIRMAN:—£5,000 is a considerable amount. I am afraid we cannot tell you more at present. We shall do so as soon as we can. The sum that has already been expended on the road (which amounts to £32 in the account, it is £200 or £300 since the account) we feel certain we shall see back in a very short time.

Mr. SHAND:—The Government will repay us.

The CHAIRMAN:—Mr. Whitbread asked three questions: as to the cultivation of the coffee, as to the acreage the Directors were intending to put under cultivation, and as to our new assistant. As regards cost of cultivation, I have Mr. Shand's assurance that he sees no reason to vary the figure he brought

home with him from Costa Rica, namely, £18 an acre for the cost of bringing rough land into coffee land. Reverting to the statement made in the prospectus that we proposed to bring 1,700 acres into cultivation under coffee at £18 an acre, any gentleman quick at figures will see that that statement will not fit in with our present capital, but we must remember that our capital has been dealt with since. We have a smaller capital than was originally contemplated, and of course we can do with a small acreage of coffee. The 1,700 acres now loom in the Directors' minds as 500 acres. About 500 acres is what the Directors at present contemplate bringing into cultivation at the earliest possible date. There you will see that the figures square with the Capital that we have in hand. If the question is asked us: Do you desire to have more Capital in hand? the Directors after due consideration will answer that question, but at present we feel we have enough Capital to do what lies before us to do, quite enough to enable us to pay a handsome dividend if our plans hold. The other question was as to the assistant that has been appointed to go out to help Mr. Rothe, in the Accounts in Costa Rica. He has been selected with the special view of managing these Accounts and sending them home month by month in the perfect form in which they come from a first-rate Ceylon estate. We believe that he is a young man capable of doing this. He is used to Accounts, and we look forward with a great deal of confidence to having our Accounts, in a very short time in a perfect and regular form, month by month.

[The Resolution was put to the meeting and carried unanimously.]

The CHAIRMAN:—The next resolution relates to our Auditors.

Mr. PHIPPS:—I have great pleasure in moving "That Messrs. McAuliffe & Davis be appointed Auditors for the current year's Account at a remuneration to be fixed by the Board.

Mr. HENDERSON seconded,
[The Resolution was put to the meeting and carried unanimously.]

The CHAIRMAN:—That terminates the business of the meeting.

Mr. WHITEHEAD:—I think we ought not to separate without moving a vote of thanks to our Chairman and Directors for the work they have so far done. I hope they will find the labours in front of them easy and satisfactory.

Mr. ROBERTS seconded.
[The Resolution was put to the meeting and carried unanimously.]

The CHAIRMAN:—Answering not only for myself and my colleagues, but also for the staff, I have to express our indebtedness to you for your appreciation of our services. We shall be pleased to give in the future all the care and attention we have done in the past. It is not exactly a sinecure. We have worked very hard for the Company, the success of which we are all deeply interested in. There is no one on the Board with a small holding—we all have large holdings, and therefore we want to do our best in the interests of the Shareholders.

The proceedings then terminated.

LADY-BIRDS AND FRUITS.—A most interesting attempt is about to be made to acclimatise the lady-bird in Egypt in order to protect the fruit grown in that country from the attacks of parasitic insects. The necessary lady-birds are to be imported from New South Wales.

COCOA LOOKING UP.—There is compensation in all things. As against the fungus and its ravages, we have the price of cocoa going up; and we now read that "A large cocoa manufacturing house has adopted a new advertising scheme. They have arranged to supply all the conductors of the most popular lines of buses in London with satchels filled with sample packets of cocoa, which are to be distributed to lady passengers."

CEYLON TEA CROP ESTIMATE FOR 1898.

The official estimate of the Planters' Association has now been published. The particulars are given for each group of districts and we repeat the table here adding to it the average yield per acre where that was reported in the proceedings of the District Associations themselves:—

	Crop	lb. per
	lb.	acre.
Ambagamuwa Association	.. 5,750,500	425
Badulla do.	.. 3,866,490	—
Balangoda do.	.. 1,150,000	400
Dikoya do.	.. 12,115,950	450
Dimbula do.	.. 19,323,510	457
Dolosbage and Yakdessa Association	.. 5,800,000	—
Haputale Association	.. 4,000,000	394
Kalutara do.	.. 6,100,000	500
Kelani Valley do.	.. 13,205,000	523
Maskeliya do.	.. 7,408,000	400
Maturatta and Hewahetta Association	.. 4,497,200	—
Northern Districts Association	.. 17,000,550	—
Nuwara Eliya do.	.. 2,174,000	429
Passara do.	.. 2,800,000	—
Punduloya do.	.. 1,733,500	—
Pussellawa do.	.. 7,993,700	409
Rakwana do.	.. 1,603,000	—
Udapussellawa do.	.. 3,090,000	421
Udugama do.	.. 560,000	—
Native and Unestimated	.. 2,000,000	—
Total	.. 122,171,400	—

It will be seen that Dimbula gives the largest quantity of tea in its well nigh 20 million lb. and that the highest average yield per acre—so far as estimated—appertains to the Kelani Valley. The time is approaching when some allowance will have to be made from the estimated total crop for our island consumption; but so far, perhaps the yield of native gardens not taken into account, counterbalances this requirement. The probability is that the total tea exports for 1898 will be somewhere between 120 and 124 million lb. and therefore 122 is a safe estimate, indicating shipments about 6 million lb. in advance of 1897. Again the shipments out of this total to the United Kingdom are likely to be about 103 to 104 million against 99 million lb. last year, a very limited addition indeed; while 18 to 19 million lb. are at least expected to be taken off for Australasia, North America, Russia and the rest of the Continent of Europe and all other parts. Seeing that 17 million lb. were diverted in this way from London last year, we shall be disappointed indeed, in view of all the efforts made to get well into the American and Russian markets, if less than 21 millions are required for direct shipments outside of the United Kingdom in 1898. This in fact is the estimate of Messrs. Forbes, Walker & Co., and if we take this quantity from the official estimate of crop, there would be only 101 million lb. left to go to London—a fact which if borne out, should ensure throughout the year, a good demand and steady if not better prices for Ceylon tea. In this connection we call attention to the proceedings of the "Thirty Committee" on our third page where it is mentioned that Mr. Christie is well pleased with the prospects of Ceylon tea in Russia, and still more to the contract entered into with Mr. H. H. Davies of Messrs. Peck Brothers & Winch Ltd. by which an expenditure of £1,000 in advertising Ceylon tea in Russia is ensured. We should like to see a native Russian Firm undertaking this duty as well, in consideration of a grant. Perhaps Mr. Christie may how the way to attain that result,

TEA ESTATE EXPENDITURE.

"IS THERE ROOM FOR ECONOMISING?"

The above question we find is being seriously asked in Agency and Estate Inspecting circles. "Is enough work being got out of the well-paid labour force?" is the more immediate form of enquiry, and comparisons unfavourable to the present time are made with the era of coffee and with the early days of tea. It is said—with how much truth we know not—that the big wave of prosperity which came in about ten years ago relaxed the care, efficiency and economy of estate working in far too many instances and that there is urgent need now for harking back and returning to the old style and quantity of work. This is, however, we suspect more easily said than carried out. Where there has been a relaxation of the close scrutiny and continuous work distinguishing the hard times of a past decade, the explanation may perhaps be found in the increasing scarcity of coolies and the greater difficulty of keeping them contented and permanently settled. If putting extra pressure to secure more work, leads to a demand for "tundus," the latter state of that plantation and Superintendent may be worse than the first. Still, we are apparently entering on a year likely to be distinguished by an abundant supply of labour, and that should just be the season for attempting to work back to the old methods where it is felt there has been undue relaxation, slackness or extravagance. In this connection we are reminded of the trouble which has arisen at the Straits through the poor prospects of Liberian Coffee. Early in January, a Straits contemporary published a very gloomy account from the pen of an experienced planter, of the outlook for Liberian Coffee in Malaya: he threatened certain weak estates with going to the wall altogether and declared that the only way for the better estates to cope with declining prices was by reforming "the hours of labour." After a dark picture of the approaching crisis, the writer, evidently an ex-Ceylon planter, deals as follows with the economy which he deems essential:—

The most practicable economy that I know of is the changing of the working hours from 6 a.m. to 2 p.m., as at present, to from 6 a.m. to 10-30 a.m. and, again, in the evening from 1-30 p.m. to 5-30 p.m. giving the coolies, conductors, and superintendent three hours' rest in the heat of the day. It is a well known fact that, when the superintendent goes home for breakfast, the coolies sit down under the coffee trees. Then, why not have them in their lines where they can also get a good meal, and go out fresh in the cool of the evening. I positively state now that I have proved that I can get 30 per cent more out of my labour in this way: and I ask any superintendent whether he feels very fit to look after his work in a burning sun after a heavy meal and "perhaps" a bottle of beer. I want two hours' rest at least, and so does any other man, and, what is more, most of them take it. This question was brought before the Selangor Planters' Association a few days ago, and it required the casting vote of the chairman to decide against the motion for working morning and evening. Many men there who voted against it stated that they knew it was the best thing to do. One man said his lines were too far away; he was a cricketer. Another man said rain came on in the evening; therefore, he would vote against the change; he was a golfer. Another said his coolies would not turn out again; he was a player of some other game. So a good motion was lost; a change that would save the proprietors of estates 30 per cent on the labour expenditure and

halve their bills for doctors and medicine. In the face of the labour difficulty, individual estates cannot make the change unless it were made general: but, if two-thirds of the estates agreed to make the change, it could be done, and some of the others, who are now against it, might be made to do it. Once a week is quite enough for a man to get away to his club and his golf, and any man who has not the interest of the estate at heart enough to make him walk round it in the evenings, whether his coolies are working or not, is not the sort of planter we need to know in Ceylon.

We do not think the system condemned above has any parallel in Ceylon: tea pluckers certainly do not end their day's work here at 2 P.M. and the hours altogether in our tea districts are regulated after a more satisfactory fashion than in the Straits. But still, that there is room here as in the Straits, for the application of economy in one shape or other, cannot be denied at least in a considerable number of cases. Not many of our working planters now, perhaps, can recall the dark days of 1866 which followed on "black Friday," the fall of Overend Gurney & Co., in London; but those who do will remember the valuable discussion on "Estate Expenditure" which resulted. A mere selection filled some sixty pages of our "Handbook" and in a final summing-up, Mr. George Wall showed in detail how between 1849-55 and 1862-5, estate expenditure had increased 54 per cent, the cost (per cwt. of coffee) of "coolie work" having risen from 12s 11½d to 19s 4½d and the average rate of coolies' pay including kanganies from 7-46d to 8-56d, while 27-7 days of a coolie were required for each cwt. where 20-8 days' labour had sufficed in the earlier period! Nor must it be supposed that crops had fallen off—the average rather having risen in this period from 5-8 cwt. to 6-2 cwt. of coffee per acre. Among other preliminary steps that gave a practical turn to the discussion of 1866, was the offer of two prizes by the Planters' Association for the best (first and second) Essays. These were won by Mr. P. D. Millie and E. Woodhouse and the heading of both ran:—

MR. MILLIE'S ESSAY.

The following remarks on increased expenditure on estates, its causes and remedy, may be confined to two general headings:—

- 1st.—On Increased General Expenditure.
- 2nd.—On Increased Expenditure connected with Coolie Labor.

MR. WOODHOUSE'S ESSAY.

"To be or not to be, that is the question."—Hamlet.

"The causes of the great increase of Expenditure on Coffee estates, and the means to be adopted for reducing it."

Can it be said that our Tea Enterprise has existed long enough to warrant the expectation of useful Essays if prizes are now offered? If there is a pressing need for economy in certain directions and if Colombo Merchants, Agents and Estate Inspectors feel that a marked change for the worse has gradually crept in, then we say there ought to be considerable scope for enquiry, reflection and practical suggestions towards reform as would warrant a call for Prize Essays. Much happens in a dozen years in a colony like Ceylon and with a tropical cultivation like that of coffee and tea. Now, Mr. Wall's comparison in 1866 only covered a period of ten to thirteen years; yet the result was eminently beneficial. The tea industry of Ceylon may be said to have begun with 1,080 acres planted in 1875; but in 1885 this had grown to 102,000 acres and by 1895 we had 305,000 acres planted out. Now, we suppose the returns for 1898 (which

are rapidly coming in for our "Directory") will show a total not far, if at all, short of 400,000 acres! Surely then, the interval between 1875 and the present year must cover much and varied experience which it would be well to bring into review. A comparison between 1885-7 and 1895-7 if undertaken after the pattern we have indicated, should give ample scope to a practical and well-informed Essayist who could perhaps tell us how Tea Estate Expenditure has increased, is increasing and how it can and ought to be diminished.

SHIPPING FRUIT.

A scheme by a Colorado man is founded on the principle that dry, fresh air is far more beneficial to fruit in transit than is the moist and confined air of a refrigerator car. In the new car, ice is done away with. An immense metal funnel is attached to the engine of a train, just above the pilot, and from this funnel a pipe, about 1 foot in diameter, extends back to the fruit-car, resulting in an automatic draught of air flowing through the car. This, it is claimed, makes a perfect ventilation, and according to the dry-air theory, will preserve fruit for several days longer than the ice process.—*Queensland Agricultural Journal*, January.

AMOUNT OF BARBED WIRE REQUIRED FOR FENCES.

The estimated number of pounds of barbed wire required to fence the spaces or distances mentioned with one, two, or three lines of wire, based upon each pound of wire measuring one rod (16½ feet), is as under:—

	1 Line.	2 Lines.	3 Lines.
	lb.	lb.	lb.
1 square acre ...	50½	101½	152
1 side of a square acre ..	12½	25½	38
1 square half-acre ..	36	72	108
1 square mile ..	1,280	2,564	3,840
1 side of a square mile ..	320	640	960
1 rod in length ..	1	2	3
100 rods in length ..	100	200	300
100 feet in length ..	6 1-16th	12½	18 3-16th

—*Queensland Agricultural Journal*, January.

THE PRODUCTION OF COCAINE.

To B. and C. "Druggist."

Dear Sir,—I have read with interest of the new enterprise encouraged in the Madras Presidency with regard to the cultivation of coca leaves for cocaine manufacture.

There is, as a fact, quite sufficient supply for the demand of cocaine as it stands, but what I fear is that the present demand will not develop, but rather recede, because cocaine is produced synthetically at less money than the lowest yet known cost of cocaine.

What is also a very important factor in the future of cocaine is that the synthetic cocaine, named eucaïne, has far less toxicity than cocaine. This fact, combined with equal efficiency, should make a Government department very cautious. I say so, because I notice that the sale of eucaïne is fast increasing.—Yours very truly,

AUG. ZIMMERMANN.

9 and 10, St. Mary-at-Hill, London, E. C.,
January 7th, 1898.

[We gladly publish the above letter from Mr. Zimmermann, who is in an advantageous position for speaking on the sale of cocaine and eucaïne. At the same time, it is only fair to point out that eucaïne is a special product of Scherings, for which well-known house Mr. Zimmermann's firm are agents. Independent observers, however, have declared that eucaïne has certain advantages over cocaine. Schmidt says that it is less toxic than the latter. On the other

hand, he says that its local anæsthetic effect is inferior to that of cocaine (See B.&C.D. "Review of the Year") One well-known house has recently introduced to medicine a combination of bocaine and eucaïne for the purpose of uniting the advantages and overcoming the disadvantages of each body.]

DURIAN SEED.

Our old friend, Dato Meldrum, writes from Johor Bharu, near Singapore, Jan. 25:—

I have sent per post (registered) to you some Durian seeds. They are of the finest sort, off a tree near the "Hall," which I planted myself perhaps 25 years ago. I wish you could only taste and try; the flavour is exquisite; Monsieur Soyer never concocted a custard to equal it—delicious is not the word—*tres superior?* No! better than that—indeed, the English language does not furnish an equivalent word to express the extreme delight and pleasurable satisfaction one derives from a full mouthful of this transcendent fruit—it is beautiful! it is magnifique! it is "ver good"!!! The odour—but no, I shall not allude to it—I have been to Cologne! the "goose dubs"!! and other salubrious places—yes, the less said regarding the odour, the better for weak or squeamish stomachs. Joking apart, the seeds I send are well worth careful planting and tendency. One branch of the tree broke with the weight of 40 young duries, causing weeping and wailing amongst our Malay servants, who always manage to secure their full share of the fruit. "Durio Zibethinus." The Durian should ripen on the tree; and unless one gets a properly ripened one at first, dislike and perhaps a "scunner" is taken to this queen of fruits—ever afterwards. Only the finest seeds should be planted such as I have sent to you. John Crawford, F.R.S., in his "Dictionary of the Indian Islands," &c., gives some information regarding the Durian.

HOW TO MEASURE AN ACRE.

Farmers would often be glad to know the area of oddly-shaped fields without having recourse to a surveyor. The following may prove of some use:—
Five yards wide by 988 yards long contains one acre; 10 yards wide by 484 yards long contains one acre; 40 yards wide by 121 yards long contains one acre; 70 yards wide by 69½ yards long contains one acre; 80 yards wide by 60½ yards long contains one acre; 60 feet wide by 726 feet long contains one acre; 110 feet wide by 397 feet long contains one acre; 130 feet wide by 363 feet long contains one acre; 220 feet wide by 181½ feet long contains one acre; 440 feet wide by 99 feet long contains one acre.—*Queensland Agricultural Journal*, January.

CEYLON TEA IN RUSSIA:

MR. T. N. CHRISTIE'S REPORT.

The long and instructive Report which will be found on another page is, by no means so encouraging as was anticipated. The difficulties in the way of spreading a taste for Ceylon tea in Russia are very considerable, while no less are the obstacles to the promotion of trade. Mr. Christie goes fully into particulars bearing on this department, and the darker he draws the picture of official interference at every turn, of prohibitory duties, &c., the more, of course, Mr. Rogivue and his work stand out in relief; but we are rather surprised Mr. Christie did not try to find out what other large tea dealers—Lipton for instance—were doing. Eighteen months ago we saw in the London City Road warehouse, a very considerable consignment of tea ready for shipment to St. Petersburg, and we were told that the progress made by the new Agency in Russia was most encouraging. Then again we should have liked to see a big Russian tea house—like the Popoffs—sounded as to what they could do for Ceylon

tea by way of advertising, if the Planters' Association placed a grant, say, of £2,000 at their command? To enlist the interest of Russian tea firms would be a great matter. Mr. Christie gives us particulars respecting the Consuls who assisted him and Colonel Stewart's connection with Ceylon is specially interesting. There was also an officer of the Argyll and Sutherland Highlanders who left Ceylon to settle at Odessa as Vice-Consul. The varying and heavy differential duties show how terribly our staple is weighted in Russia; but there is certainly a good case for a Memorial to try and get the import duty by sea and land made uniform at 1/2½ per lb. (so getting rid of the prohibitory 1s 10¼d duty). To try and get the import duty reduced is Mr. Christie's first recommendation. His second and third we should be inclined to couple together; for surely it would in a manner be benefiting all retail dealers who handled Ceylon teas, to advertise their merits. Altogether Mr. Christie gives us a very useful and suggestive Report and one that may mark a new era in our Russian Tea Campaign. It will be observed that he is emphatic in his commendation of Mr. Rogivue's operations in the past on behalf of our teas, and we have no fear that the Rogivue Company will not benefit Ceylon as well as Indian teas.

THE HAPUTALE PLANTERS' ASSOCIATION.

How is it that Haputale with about the richest soil of any planting district in the island, is behind, comparatively, in its average yield of tea per acre? The total estimated crop for the current year is 4 million lb. from 10,154 acres in bearing—total acreage 14,355—or an average of 394 lb. A return of practically 400 lb. an acre with good prices, is of course very satisfactory; but we dare say it is going to be with tea as it was with coffee, that the older it gets in certain parts of Uva, and especially Haputale, up to 10 or 15 years, the better and richer in crop, it becomes. At the same time we recognise the fact that Haputale and Uva generally, would do with some more rain for tea, although it is wonderful what the heavy dews peculiar to the Principality, give in flushes of Tea. Alas poor Coffee!—even in its most favoured home in our hill-country, it is rapidly becoming a thing of the past. What about Cacao, Cardamoms and Rubber? Haputale had an appreciable acreage in 1895 of all three products, and surely with its fine soil and sheltered valleys, some of these new products ought to do as well as in the Northern Districts? Let Mr. Bisset and Mr. Bethune, during 1898 give us a "crumb of comfort" in regard to new, even if very minor products. We had fain hoped to see Uva developing a goodly acreage of cacao. Roads and Labour Supply are by no means perfect, but the Association has faith in the Labour Federation as a means of amelioration in regard to the latter. A good deal of further useful business was transacted; but the special feature of the meeting was the adoption of the Resolution moved by Mr. Bethune, seconded by Mr. Lloyd—both experienced, thoughtful and responsible members of the planting community,—in favour of a Commission to inquire into the feasibility of a separate Ceylon Coinage and Currency. This is a very complicated question indeed; and we fear now with the Straits on the one side voting for a Gold Standard, and India striving after the same result on the other, that

it will not be easy for Ceylon to go in a silver direction. However, a Commission of Enquiry may make the matter clear, and cannot possibly do harm.

PRESERVING FRUIT.

It is perhaps not widely known that fruit may be preserved without boiling, heating, or drying. All that is necessary is to alternate the fruit between layers of sugar. The sugar, however, must exceed the weight of fruit by one-half.—*Queensland Agricultural Journal*, January.

PLANTING NOTES.

COFFEE IN NETHERLANDS INDIA.—I returned from Port Darwin on 29th November last: *en route* I called at Timor Deli—the Portuguese have had part of the island for more than 200 years—found the place dull; no progress; Government on the one hand and the priest on the other keep the people down, poor and ignorant. One year, a while ago, 30,000 piculs of coffee were exported, mostly to Batavia, where it is said the Dutch mixed it with something inferior.—*Cor.*

TEA PACKING.—The following remarks are from the London Correspondent of the *Indian Planters' Gazette*:—

Looking over samples in a broker's office the other day, some teas struck me as selling considerably above their value. In reply to my query the broker said, "but they have such a good aroma, that fine malty-burnt which you so seldom get now," which remark led to a discussion on the firing question. He said there was no doubt teas generally were fired at too high a temperature, and, consequently, to avoid burning, were not thoroughly done, from which resulted want of keeping power, and much of the dull flat smelling teas met with in the market. I have no doubt there is much truth in this, and teas would arrive in more satisfactory condition if at least the latter part of the firing, as well as the final firing, was done at a much lower temperature than is the usual custom. To do this thoroughly in all cases means a larger consumption of fuel, and in many factories would also require more drying machinery, but it would, I believe, amply repay the expenditure. From this we went on to discuss packing, and he said, "An old planter was saying to me the other day:—'I was always careful to solder in my tea hot.'" My reply to this was that I was afraid many more were not sufficiently careful not to pack or solder their teas before they were nearly cool, as so long as the tea is hot it continues to give out moisture, and it should be allowed to come within not many degrees of the atmosphere before it is packed. I have not experimented on this myself, but I would advise some of your readers to try the experiment of packing one chest as it comes off the fire at say 240°, and another when the tea has cooled down to about 100°, and opening them some days afterwards to see which tea seemed in the better condition. Since I had this conversation with my broker friend, a dealer has been asking my opinion on the same subject; as he often found some damaged tea on the top of the chest, though the rest of it was in good order, and this he attributed "to the tea sweating when packed hot." The importance of the subject must be my excuse for drawing attention to it, as though practical planters must know more about it than we in London can do, yet there is doubtless difference of practice, if not of opinion, amongst them, as how both firing and packing can best be done. In a previous letter I drew attention to the question of bulking and the necessity of even packing, as well as even mixing if the tea was to pass without rebulking here, so need not refer to this today. Mr. Lipton is said to still continue buying only London bulked teas, but I do not think many others are following his example.

Currency, Dear Money, Finance and Trade in India.

A LEADING CALCUTTA MERCHANT SPEAKS OUT TO SOME PURPOSE :—

"INDIA'S GREAT CURRENCY PROBLEM CAN BE SOLVED BY OUR FIELDS AND BY HER LOOMS AND BY THEM ALONE."

After referring to the Bank Accounts, (at the annual meeting of the Calcutta Bank Limited Jan. 28th) Mr. DAVID YULE as Chairman said :—

As you will remember, money was very stringent during the first half of the year, but as soon as July was reached, a much easier feeling was experienced, and employment for funds at profitable rates became, weekly, more difficult to find. Although a glance at the record of the official Bank rate does not indicate that money was too plentiful, it is nevertheless a fact that accommodation was available on short notice at 3 per cent below the official minimum. While strongly of opinion ourselves that the drop in the open market was not warranted by the real state of the currency, the persistent way in which money was, so to speak, thrown at their heads, induced many people to believe that the burden of tight money had been removed, and that they might enter into fresh transactions without fear of this disturbing influence in future. The mistake of trusting too much to the temporary depression cannot but be the cause of serious inconvenience now, and until this recent lesson be forgotten, borrowers will be inclined to accept the official Bank rate as a guide to their financial operations in preference to the illisiveness of Burra Bazaar. It is, however, interesting to know that the reason of the divergence between the two rates was, in great measure, due to native capital, previously employed in the financing of piece-goods and produce, seeking re-investment in new channels. This brought native capitalists more openly than has been customary into competition with the Presidency and other Banks. Piece-goods and produce dealers have not done well some months past, and many of them have lost the margin of security which alone commended them as borrowers. There is, I regret to say, no hopeful feature in their trade, which dealers can point to as an inducement to their bankers to renew advances. The piece-goods market has been upset by the vagaries of exchange, and stocks have accumulated owing to the failure of the retail demand, through poor crops and the general impoverished condition of the masses. As regards produce, the influences of anticipated large crops and glutted consuming markets have justified great caution being exercised in making advances.

SPECULATION ENCOURAGED.

The result of the unwillingness of bazaar capitalists to provide, as had been their custom, for these branches of trade, was to create a strong speculative movement in the Shares of Joint Stock Companies and in Government Securities. Prices of some of the former advanced 40 per cent, and stocks, which previously were unsaleable, became freely inquired for, while the market absorbed readily the new Government 3½ per cent loan of 300 lakhs at the comparatively high rate of 98¾ per cent, besides relieving holders of Indian Government Paper in Europe to the extent of about 425 lakhs. So far as can be seen at present, the money put into circulation in these directions is likely to remain locked up for some months, and, although the men who are providing the funds to carry over the heavy indebtedness, from month to month, are well able to look after their own interests, and invariably do so, borrowers are feeling acutely the change that has so suddenly come over the market. What their position is may be inferred from the fact that Banks have been unable to advance against Government Paper, with full margin, at 13 per cent. It is not surprising that there has been a sharp fall in the value of all securities, and the tendency appears to be still downwards. A source of weakness is that

so much of the burden is carried by native capitalists, who are not accustomed to the transitory periods of depression which overtake the stock market.

RUPEES ARE NOT REMITTED.

There seems to be an impression, shared in by the Finance Minister, that the stringency of the money market is due, in great measure, to the withdrawal of European capital which had been employed for banking purposes in India. This transfer of capital indicates the existence of a want of confidence either in the prosperity or security of the country or in the ability of the present currency policy to maintain a favourable rate of exchange, but the transfer does not affect the number of rupees in currency, as it does not take the shape of a shipment of rupees. If A remits £100 to London, he pays over his rupees to B who wishes to transfer a similar amount in sterling to India. Such a transaction can have no power to increase the stringency of the Indian money market, unless the rupees A parted with are withdrawn from useful circulation by B. There is no evidence that the market has been deprived of the use of such rupees. On the other hand, it must be admitted that, had rupees not been released from hoards, since the closing of the mints, trade would have suffered even more severely than it has done for want of coin. The causes of the stringency must be looked for in the many directions in which it is possible for rupees to disappear from circulation. Besides these we have to take into account such factors in this question as the growth of population, the extension of industries and of railway communication, all of which tend, by opening out the country, to disperse rupees more widely from the centres of circulation. As you are aware, the life-blood of the currency policy of 1893 depends wholly on the scarcity of rupees, and so surely as December comes round once a year, will the period of dear money return. If money this year gets cheaper before the end of June, the fact may safely be taken as a sign of a falling-off in the trade activity of the country.

FANCIFUL VS. ACTUAL CALCULATIONS.

At the meeting of the Legislative Council on 14th instant the mercantile member produced a statement to show the amount of money that would have been saved by Government if the rupee had been maintained at 1s 4d during the financial years of 1894-95, 1895-96, and 1896-97. The inference is that the saving not having been made, Government had lost, or become poorer, by the sum of R1,192 lakhs, or (at exchange 1s 4d) £7,945,735. This calculation I regard as an altogether fanciful one, for there are many items which would have tended to reduce the saving, if not wholly dissipate it, had Government been powerful enough, I will not say they did not try, to screw exchange up to 1s 4d, in spite of the conditions of trade which operated to make the actual rates what they were. While on the subject of this calculation, another one more interesting suggests itself to me, and that is the loss that holders of Government Rupee Paper have suffered, during the past six months, through the currency policy, or the pecuniary difficulties of Government. It would be well to compare it with the calculation before referred to—Government's loss in 3 years, 1,192 lakhs, equal to £7,944,733; holders of Rupee Paper loss *in six months*, 646 lakhs, equal to £4,310,833! I do not claim that there is any connection between the two calculations. I merely wish to point out that there are some losses about which we hear very little but which are even more important than that of the Government's loss by exchange. The difference between the two calculations is that one is fanciful, while the other is actual, as any one who held Government 3½ per cent Paper on 1st July last, and wishes to dispose of it now, can have practical demonstration of. Poor India has many evils to contend against, and very few of them are enquired into and redressed. It is a very curious thing, however, that the Government's loss by exchange is constantly the subject of complaint and commiseration. Portios of the annual budget are devoted to the subject. The Empire appears to be wholly in the power of this distressing item, although

other preventible charges are greater, and have served no more useful purpose. Short rainfall, bad harvests, floods, fires, earthquakes, and other misfortunes affect the welfare of the people, and such calamities will, no doubt, recur from time to time, but so far no public meetings have been called to pray for legislation to stop the loss which they occasion, or to make those who do not suffer pay up for those who do. Such losses are regarded as not preventible and are borne resignedly. Loss by exchange, however, has come to be regarded, by Government officials particularly, as a preventible loss, which must be avoided at any price. The Government in endeavouring to get quit of the loss by exchange at this stage of the country's progress, are not a whit more reasonable than the directors of a steamship company would be in giving orders to their Commander to leave no room for the coal, but fill the space up with cargo, and then expect the steamer to proceed on its journey. No matter how the Government may avoid this loss in their accounts, the people of the country have got to pay the bill, and the bill comes to a great deal more than the saving to Government. I am quite sure that the Secretary of State had no conception of the harm that would be wrought by the closing of the mints. The course of starvation which had to be adopted to bring the rupee into subjection was not explained, or was not contemplated, by the authors of the policy. The measure was ostensibly to prevent the further fall of the rupee, but the Government have, instead, striven to raise the value to a point at which it cannot remain without breaking the backbone of the country, which is its trade.

It is this desperate ambition to have 1s 4d exchange, at any sacrifice that has wrought

THE FAILURE OF THE CURRENCY LEGISLATION OF 1893. and brought the people to the verge of ruin and discontent. What confidence can there be in a policy that buys rupees for 1s 4 1/2d and sells them a few days after at 1s 3 1/2d or declares that a limited amount of Telegraphic Transfer will be sold out of the 40 lakhs Councils offered and two weeks after sells the whole amount in that form! Can any business man have the patience to anticipate such vagaries, or to believe that they are working for the common good of the country? I think not. It is evident, too, that the Government have lost confidence in their ability to prevent fluctuations in exchange, and to maintain the rate at 1s 4d without utterly upsetting their revenues. The condition into which India has fallen may be gathered from a few words which fell from the Finance Minister's lips on 14th instant. He said:—"It must be understood that we are not rolling in wealth while we are refusing aid to others, and our inability to advance money is due, not to any willful obstinacy, but to want of adequate means. The Secretary of State cannot draw on us for more than we are able to pay. The fear is, therefore, that the market may reach a point where money will become actually unavailable, and merchants will find it impossible to sell their bills." The Government claim the right to do what every sound trader does, but it strikes me that a sound trader could not expect to get assistance on such a statement of his accounts. There was, therefore, not much prospect of the Indian Paper Currency Act of 1898 which came into force on the 21st instant being of much help to the people. Its intention is to give relief in cases of dire necessity by allowing for the speedy introduction of foreign capital to the country. Council wire and bills might, at any time, be insufficient to meet the demand for money, and a panic would ensue were no other means available to get a supply of coin. It must be assumed that before the benefit of this Act could be taken advantage of by the people, the greatest measure of confidence would be required by the parties whose gold is to give the relief. There was not one word of encouragement given. "The Government did not know, and perhaps they need not know, whether the facility would actually be avoided or not." That was all. To know that the Government was a life-boat on the east coast of Scotland would give as much prospect of rescue to a sailor drowning in the Hooghly. The Exchange Banks, it

is admitted, are not benevolent institutions, and are not likely to pay 1s. 4 1/2d. in gold in London to get one rupee here, unless their way is clear to make a profit on the transaction. The Banks' position is such that they do not require accommodation of the sort for their own safety, and they assuredly do not intend to sell their gold for rupees at the topmost limit of the market until they first have the definite promise of mercantile bills at a covering rate. Exporters, in the same way, are not endowed with surplus charity, and are content to sit idle, rather than by produce, payment of which has to be negotiated at the maximum rate of exchange. The result is that prices of produce are driven down in the Indian markets until the level of security for the exporters is reached. This is what is happening today with all Indian produce, now in season, as sellers of indigo, jute, cotton, tea, gunny bags, cotton yarns, and other articles can tell you.

IS THE GOVERNMENT BLIND TO THE CONSEQUENCE.

Is it possible that the Government of India see no danger to their revenues if such a state of things be allowed to continue? Do they still persist in holding that this country, as a whole, makes no loss in its international trade by an appreciation of its standard, since the lower price received for its exports is balanced by the lower price paid for its imports? The fallacy of this theory in its application to India, needs no better illustration than what is happening in our markets for export produce, the condition of which I have just described. How long can growers go on accepting fewer rupees for their produce while they have to pay the same rent, the same wages, and taxes with an increasing burden of debt at an increasing rate of interest? How long will the money-lenders suffer repayment of their advances to fall into arrear? The agricultural population of this country display great, even dogged patience at their toil, but the money-lenders have the doggedness without the patience. The village grogshop harbours the result—a dissolute and heart-broken peasant, once a thriving ryot. His loss to the land is the loss of revenue to Government, for the people cannot continue to cultivate land which gives no return. As a practical illustration of the effect of stringent money and depressed prices, I am informed by some of the largest indigo producers in the North-West that they will not sow next season. The land thus released may not be cultivated, for other products are about as profitless as indigo.

MANUFACTURES HAMPERED.

It is not in agricultural pursuits alone that the stringency of money is felt. Manufacturing industries are hampered in their operations by the inability or unwillingness of bankers to advance funds either for further extensions or for the purchase of raw material. The manufacturer to get money has, therefore, to dispose of his goods as he makes them at the best price the market will pay for them. Importers, too, have cause for complaint, for buyers take delivery of goods only under compulsion owing to the absence of demand in retail. The fact is, the masses are unable to buy to the same extent as when money was cheap and plentiful. They have barely sufficient to purchase the food required to keep body and soul together. Comforts, such as new cloths, are out of the question. Some amelioration of the lot of the people is required, for nothing is so disposed to make a man discontented and rebellious as the stoppage of the wherewithal to buy these little comforts, which give some colour to the dull grey monotony of an Indian workman's existence. Lancashire men are quite aware that an artificial rate of exchange has done endless damage to their cotton piece-goods and yarn trades. Bimetallism for India is now the cry of these competitors with the Indian cotton mills, their rapacity is not satisfied with a 1s 4d rupee. It was believed that the Government of India would readily tumble into the trap that was laid for them by the enthusiasts of France and America, but as the records of currency literature show, the attempt to raise the rupee to 1s 1 1/2d was promptly refused. There

is now an excellent opportunity to make another calculation to show what saving Government would have effected if they had accepted the terms proposed. There is no rule, however, by which appetites are controlled, and it is difficult to understand why the meeting of the home expenditure at 1s 11d exchange, is not indefinitely more advantageous to the Government than a rate which varies between 1s 2d and 1s 4d. The irritability of the digestion which rejects the solid feeding obtainable for 13d in favour of an unhealthy and irregular repast at 16d might have been expected to be relieved when the Parisian treat at 23d was displayed. The Government of India have forgotten that one of the objects they had in view when the mints were closed, was to force international bimetalism.

NEW STANDARD AIDS.

In not accepting the Paris and American banquet the Government shewed good taste, as it certainly would not have looked well to display a leaning towards extravagance, while funds were so low in India. The Government have, however, explained their reluctance to have anything to do with the tempting advances made by America and France, and no true friend of India will, for a moment, believe that this decision was other than a wise one. The explanation given is, of course, not quite logical, but the experience of the past four and-a-half years is enough to show how disastrous the result of meddling with the standard of value, even to a minor extent. The consideration which has been given to this proposal and the arguments which have been adduced to show that it was better for India to hold aloof from its adoption, will, I trust, influence the Government to give back to the country the prosperity it enjoyed prior to 1893. That a great advance has been made in respect of our Indian currency, in the direction it was contemplated by the authors of the policy of 1893, is no doubt true, for rupees in circulation at trade centres have been reduced much below requirements, and India is now ripe either for a future experiment in making wealth exist by legislative enactment or for retracing the steps which have led to so much or inconvenience and loss. The belief is gaining ground that the Government are not prepared to rectify the blunder of 1893, until they attempt to inaugurate a system for making the rupee currency convertible, and some colour is given to the report by the statement of the Finance Minister that public and official opinion in England has been prepared for the possible necessity of a measure which may involve the actual diversion for Indian purposes of a certain amount of gold from the general available stock. The Finance Minister, however, was unable to give a final reply, as to the precise measures to be undertaken, as the matter was under consideration, and it was impossible at the present time to make any definite announcement. From this, it may be inferred that India may yet be involved in another experiment, which even though there be sufficient gold at its back to carry it to a successful issue, must, in the meantime, cause further disturbance to trade. It is but a few months ago that the Bank of England rate was raised to four per cent on the mere apprehension that gold might be withdrawn from the Bank of Japan, and there can be no doubt that the tendency is towards a higher rate of interest in England. The annual cost of a conversion fund in gold, sufficient to meet all possible demands on it, must be very heavy, and would in itself be a considerable tax on the Indian rate-payer, apart altogether from the enormous gold indebtedness which has already been incurred, and which, so long as the present currency policy lasts, cannot but increase. The late Finance Minister estimated that to establish an effective gold currency £77,000,000 would be required, and I think, he afterwards stated that for a conversion fund £15,000,000 or 1-5th of the rupee coinage in active circulation would be wanted. The estimate of £77,000,000 for the gold currency was based on the belief that there were in 1892, 115

crores of rupees in active circulation; the mints accounts show that in all 355 crores have been coined. There is no doubt whatever that the great danger to the convertibility of the rupee lies in the certainty of the hoarded or dormant rupees coming in for exchange. Another factor, which must not be lost sight of, is the rupees which have been, and may be, coined by the people themselves unknown to the Government and to the impossibility of preventing coinage in the native and neighbouring hill states. The demand for gold for India's purposes would most assuredly cause a further fall in silver bullion, and the manufacture of spurious rupees would become thereby all the more profitable, although the profits on this nefarious trade are now enormous. It must be remembered that so long as the rupees contain the required fineness of silver, the Indian public does not regard the coiner as one who inflicts loss on them. Very few will inform against him, he is an enemy to the state but not to society. So long as that is the case he is safe from interference; and when money is stringent and rupees are denied by the Government, the coiner's trade is probably looked upon, by his neighbours, as a very necessary one.

THE DANGER OF TRYING GOLD.

The assertion that the machinery for the convertibility of the rupee would be automatic, I do not for one moment believe. The Indians' love for gold is well-known, and they would, knowing the poor success that has attended the Government's efforts to maintain the gold value of the rupee in the past, not miss the opportunity of at once exchanging their silver while it was possible to do so at an advantageous rate. The ratio fixed at the outset of the new policy by Government would be regarded by the people as the maximum value of silver rupees as compared with gold. Rightly so; it would be quixotic to expect any change in favour of rupees. To defer making the exchange for gold would endanger, not benefit, the position of holders of rupees. To leave out of the calculation, when determining the amount of the gold conversion fund required, the hoarded and spurious rupees, would undoubtedly involve the failure of the system as soon as it came into force. The experience of the past should convince the Government that in a scheme of this sort, it is absolutely essential in the first place, to establish confidence in their power to carry out what they under take to do. This confidence could only be established by having a stock of gold of sufficient magnitude to meet at possible demands on it. Not only must the ability of Government to carry out their promises, under ordinary trade conditions, be undoubted, but they must be prepared at all times to meet a sudden run on the fund. A thoughtless word spoken in the bazaar might any day lead to a panic, and no considerations of the effect upon trade would restrain the rush that would ensue for gold. Rupees would appear from most unexpected quarters, and the demand would not be satisfied until the last available rupee was exchanged. What the effect on the money market would be can well be imagined. A movement of this sort would probably be engineered by men like the gold dealers of Bombay, whose operations have practically controlled the course of sterling exchange during the past year. Were the gold supply to fail, the rupee would fall to a lower point than it has touched before, and the credit of the Government would be, to use a mild expression, very seriously injured.

I do not deny that a machine to save the loss by exchange and to remedy the evils which have arisen from the 1893 policy is required. £10,000,000 would not be too much to pay for it. The purchase might have been made some years ago had the Government placed any reliance on its efficacy, for the contrivance was on view before the mints were closed, and its action was explained by two of the members of the Indian Finance Committee. The Government elected, however, to try the most likely tool first. They have done so, and it has failed. The coming one may do the work, it is more likely to break down, but will

in the meantime serve to carry on a mistaken policy. I have said that the first cost of the machinery would be cheap at £10 millions. The late Finance Minister thought it might require £15 millions, other experts have not committed themselves by naming any figure. They went no further than stating that the quantity of gold put down must be substantial. A business man, I think, would come to the conclusion that not less than the full equivalent of the hoarded rupees, one-half of the exported, something for the spurious and a quarter of the rupees in active circulation, would be sufficient—in round figures about £70 millions. The mint estimate of the gold in circulation in the United Kingdom is £91 millions, so that our friends in Lombard Street would have some little difficulty in providing the accommodation we seek. I fancy both public and official opinion would be found in a very unprepared condition to receive our orders. I am afraid £10 million is about as much as India could afford to borrow for the purpose of rupee convertibility at present. The Finance Minister is in immediate want of the sum to meet payments in London, and on the principle that charity begins at home, he would, no doubt, put the capability of the machinery to test, by being himself the first and only customer for the gold. Those who cannot put their rupees in the slot, might occupy themselves by considering to what extent the diminution in balance of trade has during the past few months interfered, and will continue to interfere with the sale of Council Bills, and what period of time must elapse before the rupees in the treasury reserves are melted down and sold in the form of silver bullion to meet current sterling expenditure. It may be interesting at this point to look back and examine the condition of India and Indian trade in 1892 before the closing of the mints. We find that the revenue was expected to be 249 lakhs more than anticipated in March, 1891. The losses due to the decline in exchange and the falling-off in land revenue were nearly made good by the remarkable improvement in railway revenue and by the increase under most of the heads of revenue. The increases were ascribed by the Finance Minister to the "general progress of the country."

CHEAP SILVER MEANS PROSPERITY IN INDIA.

Sir Richard Temple, who must be credited with having a wide experience of India, in referring to this Budget in the House of Commons on 17th June, 1892, is reported to have said:—

"I have heard many such statements delivered in this House, but have never heard one which has given me greater confidence in the future of Indian Finance, despite all sinister anticipations. Nothing could tend more to inspire confidence in the stability of Indian Finance than the fact that, despite the enormous disadvantages which have to be contended with, there is still a surplus. The Revenue has not only been maintained but it has gone on increasing. There is ample evidence of the good financial management of the country, and of the most satisfactory features of that management is that great progress has been made in works of public improvement with very little addition to the public debt. The general prosperity of the country is shown in the extension of trade, agriculture, and other industries. There has been a marked increase in the population, every year adding two or three millions to the tax-payers of British India. There is a gradual reduction of the National Debt and of the interest upon it. Many have suffered from the fall in the rate of exchange, but the cheapness of silver has something to do with the prosperity that is shown by the Budget statement and has helped the people of India to bear up against their misfortunes. So that if they lose in one way they gain in another. The loss by exchange is recouped by the general prosperity of the people to which the cheapness of silver conduces. These facts speak volumes for the improvement of the country within this generation, and especially within the last fifteen years, and I think, the House is thoroughly to be congratulated on the existing state of things as shown by the

present Budget. It is quite clear that those who are best able to judge have come to the conclusion that the credit of India is good, and that the Government of the country is thoroughly to be relied upon."

I would ask you to compare the foregoing with the remarks made by Sir James Westland a few days ago, on the existing condition of Indian Finances. Not many weeks ago the Government deprived a Rajah of the privileges of his rank for alleged harsh treatment of his ryots. I wonder whether there is any prospect of similar punishment being accorded to the authors of the 1893 policy. The only sensible remedy to the present unfortunate position of India and of her traders is to gradually re-open the mints to the coinage of silver. As London thinks in gold, let India think in silver. Instead of borrowing or purchasing gold, let rupees be sold in Calcutta, Bombay and Madras by weekly tender, the tenderer of the greatest weight in silver bullion for each lot, say of one lakh of rupees, becoming the purchaser. The Government could fix a limit from time to time under which rupees would not be sold, thereby establishing an automatic silver currency regulated by the trade demand for money. This, with the application of the knife to certain of the home charges, would give to India the fullest measure of prosperity.

India's great currency problem can be solved by her fields and by her looms, and by them alone.

Gentlemen, I must apologise for having taken up so much of your valuable time. My only excuse for having done so is that the interests of your Bank are indissolubly connected with the prosperity of Indian trade in all its branches. I cannot help feeling that the high rates of interest now charged for accommodation are telling very heavily on all the industrial undertakings of the country, leading gradually to their decay and discouraging all effort in the direction of extension.

PLANTING NOTES.

RUBBER-GROWING IN PERAK.—Planters in Ceylon interested in this industry will give attention to the useful Notes affording official experience in Perak up to the end of last year prepared by Mr. L. Wray, curator, and which will be found in our *Tropical Agriculturist*. These notes are specially useful to compare with those given in the Ceylon Botanic Gardens and Forests' Reports and the latest results of all will be given in a second edition of our Manual on "India-Rubber and Gutta Percha" now being prepared.

TEA IN AMERICA.—The following is from the *American Grocer* of Jan. 5th:—

The estimated supply for the United States and Canada, seasons of 1897 and 1898 is 86,200,000 pounds against 93,551,357 pounds season 1896-97. Total shipments, as advised by mail January 1, were 75,298,904; to be shipped, 10,901,096, of which 6,485,561 pounds are Formosa, showing a very backward movement of the crop. From the estimated supply there must be taken the quantity of tea rejected at all ports, estimated at New York alone at fully 5,000,000 pounds for the present season. It is also stated that 1,500,000 pounds of Formosa yet to be shipped will not come up to present standard and is not likely to come forward. The estimated supply of green is 13,000,000 pounds, against 16,216,906 last season; of Japan, 42,500,000 pounds, or 176,418 pounds less than in 1896-97; 17,500,000 pounds Formosa, or a decrease of 1,494,324 pounds; only 200,000 pounds of Amoy, against 1,152,846 pounds last season; 4,000,000 pounds Foochow, an increase of 569,673 pounds; 9,000,000 pounds of Congou, a decrease of 2,080,536 pounds, as compared with the previous season.

The above brokers' statement fails to take account of the movement of Ceylon and India tea, of which 12,000,000 pounds were imported last year into the United States and Canada. Statistically the year opens here and in England much better than last year.

CEYLON TEA IN RUSSIA.

MR. T. N. CHRISTIE'S REPORT.

We have received the following from Mr. A. Philip, Secretary to the Ceylon Planters' Association :—

REPORT ON A VISIT TO RUSSIA IN CONNECTION WITH THE PROSPECTS OF CEYLON TEA THERE.

During my trip to Russia, which occupied four weeks, I visited St. Petersburg, Moscow, Kief and Odessa, and I gathered much information on the subject of my mission both from wholesale and retail dealers, as well as from other sources.

My inquiries were much facilitated, and my trip rendered pleasant, by the efficient services of Mr. C. H. Mackie (Proconsul in the Consul General's Office, St. Petersburg) in the position of Secretary and Interpreter to Her Majesty's Consul-General in St. Petersburg (Mr. J. Michell), Consul in Moscow (Mr. A. T. Medhurst), Consul-General in Odessa (Colonel-Stewart, C.M.G.) and Vice-Consul (Mr. H. G. Mackie) in Odessa, all interested themselves greatly in my enquiries and rendered me much assistance. Colonel Stewart, I may mention, was especially interested in Ceylon, being the son of a former Civilian and having been born in the island. He is likewise an old friend of H.E. the Governor.

The Russian tea market is one on which Ceylon has cast longing eyes for some years past, but it is well at the outset to understand that with one exception—a very important one it is true—there are no facts which make it at all attractive. The one attraction to us is the fact that Russia consumes in the aggregate a large quantity of tea—that there is still a world for us to conquer—but the consumption per head (for a tea drinking country—is miserable, the area of territory over which this consumption is spread is vast, and the conditions under which the trade is carried on are, one and all adverse to an increase of consumption and to a rapid change in the channels of supply.

In explaining these adverse features, it may be well to point out that they are not discouraging opinions of my own, but facts, the clear knowledge and recognition of which may save individual disappointment and the expenditure of public money in directions unsuited to the conditions we have to deal with.

IMPORTATION AND CONSUMPTION OF TEA IN RUSSIA.

The consumption of tea in Russia (excluding Finland) last year (1896) was about 52,000,000 lb of leaf teas and 40,000,000 lb of brick and slab teas, while the population by the census of 28th January, 1897, is shown to be 126,683,000. There was also an importation of green tea, but it is excluded in the official summary of imports, and seems to have been almost entirely re-exported to Asia. Finland, with a population of 2,527,000 imported 179,000 lb, and the import duty there is about 20 per cent. less than in Russia. From the table A. included in my annexures, it will be seen that the importation at the Black Sea frontier has during the last 10 years steadily and largely increased, while that at the Russo-Prussian frontier has proportionately diminished. The meaning of this is that the business in China tea for Russia, at one time to a great extent done in London, is now done by direct shipments from China to Russia in the Volunteer fleet steamer. That

the import across the Russo-Prussian frontier has not been killed altogether, and has indeed slightly gone up of late, is due to the increasing importation of Ceylon tea from London via Königsberg. Although it was natural that there should have been a tendency towards direct shipments between China and the Black Sea, the change in that direction has been much accelerated by the establishment of differential railway rates on goods from Odessa to the Interior. Tea arriving in Russian ships is taken to Moscow for 92 kopecks per pood, while that arriving in English or other foreign ships is charged 1 rouble 20 kopecks per pood. This differential rate happens to act in favor of Ceylon as against India, owing to the fact that the Volunteer boats call at Colombo, but it is none the less unfair and in contravention of the most favored nation clauses of our treaty with Russia—see Articles IV. and V. of that treaty, Annexure E. From the figures given in my Annexure C. it will be seen that the importation at Irkutsk of China tea by the overland route has been well maintained during the last 3 years, and that, including brick tea, some 64 per cent of Russia's total consumption crosses the Chinese frontier, but of the leaf teas, which form our principal interest, less than 38 per cent adheres to that route.

I was surprised to find that in addition to there being, naturally enough, lower scales of duty on brick and slab teas, two rates of duty on leaf tea are in force. Tea crossing the Chinese frontier is charged a duty of, say, 1s 2d per English lb., while tea entering at the European frontier is charged, say, 1s 10½d per English lb. As Britain has no access to the Russo-Chinese frontier, this is practically a differential duty and a breach of our treaty of Commerce—see Article II of that treaty, Annexure E.

When one hears of the time occupied in bringing tea overland, one wonders that any tea for western and southern Russia should continue to come by land. It is generally 8 months on the way, often unheard-of, and its whereabouts unknown for 3 or 4 months, and the wholesale importer has to find the money for its purchase nearly a year in advance of its sale by him. The expense of the land route is about 3) kopecks per pound more than that of the sea route, but the difference in duty is about 3½ kopecks per lb. in favour of the former, and so the trade continues. Much of the tea, I was told, already reaches the new Siberian railway at or east of Tomsk, and the further extension of that Railway will alter many of the conditions of the overland trade. Ceylon tea chiefly enters Russia through the Russo-Prussian frontier, but the supply for St. Petersburg goes direct by the Baltic, except in winter, and the shipments to Odessa both from Ceylon and London supply the southern demand and to a small extent Moscow, etc. It is not possible to find out how much Ceylon tea enters Russia, as the English returns cannot discriminate whether tea shipped to Germany is for consumption there or for transit, and the Russian returns cannot discriminate between Ceylon, Indian or China tea coming through European ports.

I believe the consumption of Ceylon tea was close on four million pounds in 1896, and I would expect, from all I heard, that that quantity was considerably increased in 1897. I found that opinions varied as to the relative advantages of direct as against London shipments, but as yet a large majority of importers prefer the latter, and my opinion is that for the Moscow and Northern

districts, they will remain the most popular. There is such a manifest advantage in being able to receive by post samples of teas about to be exposed at Mincing Lane, in time to wire, or even write, purchasing limits and orders, that the saving in transport does not compensate for the uncertainty of Colombo, bought teas being precisely what is wanted. Direct shipments will, I doubt not, greatly increase, particularly if large uniform lines of tea can be purchased, and Odessa will more and more become the distributing centre for the South and South-East. I believe that through rates from China and Colombo to Moscow have been arranged for, and the system in force of keeping the teas in bond during their journey to and storage at Moscow, enables the dealers to clear just the quantities they may from time to time require. There is, I may mention, no foundation for the statement, made to me in London, that the Russian Customs' regulations necessitated the clearing of, and consequent payment of duty on, the whole of a consignment at once. The dealer can draw as much or as little as he likes, and he pays duty only on the quantity taken out. There are no Octroi duties in Russia.

GOVERNMENT REGULATIONS CONCERNING THE SALE OF TEA.

No tea can be sold retail in Russia except in closed packets and no packets can be sold unless they have been packed in an authorized packing-room in presence of a Government Officer, and have the Government bandarol or wrapper round them. Indeed, although the tea has all previously paid the import duty it is treated in the merchants' warehouses precisely as if it were in bond until the packing is finished and the bandarol affixed. The Government supplies and pays the supervising Officer, who keeps the keys of the warehouses, and it is only in his presence that the teas are moved to the packing-room, bulked, weighed and packed. He keeps detailed records of all the quantities received and sent out, and returns are rendered to the central authority. The Officer has it in his power to be obstructive, but I fancy a private monthly payment secures his good-will and makes him act as a general superintendent of the packing-room and the workers employed there. At present the Government requires that a minimum quantity of 48,000 lb. per annum shall be packed before they will grant authority for a packing-room to be established. It was reported that this minimum is about to be raised to 200,000 lb. per annum, but I could get no official confirmation of the report. The Government makes a charge for the bandarol label varying according to the size of the package. On a one pound (Russian) packet it is $\frac{1}{4}$ kopeck, on a half pound 1-5th, on a quarter $\frac{1}{8}$, on an eighth $\frac{1}{16}$, and so on.

This system of compulsory Government supervision and use of a bandarol is of recent origin, and was introduced with the ostensible, and, no doubt, to some extent real, object of preventing fraud in weight and adulteration, but the large firm of Russian dealers to whose influence the system is said to be due, undoubtedly hoped that it would crush out all their small rivals.

It does offer a serious obstacle to the starting of a small business, and it entirely prevents the importation of packet teas, but small dealers have in some instances combined and maintain one packing-room amongst several, and in other cases they send their teas to be packed at one of the

establishments, paying an arranged-on charge. I heard this charge in St. Petersburg quoted at 4 kopecks for 1 lb packets.

THE CUSTOMS OF THE RUSSIAN TEA TRADE.

One of the prejudices on the part of the consumer adverse to small dealers is that of dealing only with shops which sell nothing but tea, or, at most, tea and the kindred products—coffee, cacao and sugar. The rent, taxes and administrative charges all fall on the one article, and it requires a large turn-over to meet them. In the country and in the poorest portions of the City, the prejudice does not hold good, and shops with a general business sell packet teas, supplied by some of the large packing houses. The custom of the Russian tea trade which is most adverse to small wholesale dealers is that of giving long credit.

The scarcity of money in the country, the long time occupied in transporting goods to the outlying districts, the necessity in some places, where winter closes the transport, of laying in stocks months in advance and probably the rivalry between the few large wholesale dealers, has led to a system of very long credit having become quite inseparable from a wholesale business. Six months is the usual period quoted, but it is often extended, and nine and even twelve months are not unheard of. It will be easily seen what a large capital is necessary to enable the wholesale merchant to provide for these long periods the cost of the tea and, what is much more serious, the $1/10\frac{1}{2}$ d per lb of duty. The wholesale dealer gives the retailer a high discount—20 per cent. I believe is usual and as that discount is not merely on the cost of the tea and its packing, but also on the duty, it is evident that the price of the packets must be fixed at a very high figure in order to cover the discount. The Russian peasant is extremely poor, and the minute size of the packets prepared for him shows the limit of his purchasing power. Packets containing half an ounce are largely dealt in, and I saw some which contained but one-seventh of an ounce. I was assured that there are millions of the people to whom tea and sugar are practically unknown.

THE DUTY ON TEA IN RUSSIA.

The crushing import duty to which our teas are subjected, and which, as I have said equals 1s 10 $\frac{1}{2}$ d per English pound, is of course the greatest hindrance to extended consumption. The present rate of duty on the European frontier seems to have been fixed in 1885, being a slight reduction on the previous rate, and that on the Siberian frontier in 1887, when it was slightly raised.

The price of tea has, as we know, fallen considerably during the last ten years and the *ad volorem* incidence of the duty has become much heavier. The Russian duty must now equal on an average more than 300 per cent. on the value of the article, for much of the China tea imported costs less than 6d per lb. The duty is, of course, in no way a matter of treaty arrangement, and can be altered at will by the Russian Government. Its reduction would greatly stimulate consumption and benefit the poorer classes.

ADVERTISING IN RUSSIA.

I found that while all the retail dealers in Ceylon tea were anxious that advertising should be undertaken and looked to much benefit therefrom, the whole sale merchants expressed the opinion that it would be of no use. The con-

ditions met with in Russia certainly differ widely from those in the countries where so much money has been spent on advertisements of our staple. The great mass of the people cannot read, and to this fact is attributable the rather curious extent to which picture representations of the goods dealt in are displayed on the outside of shops. The newspapers are read by comparatively few, and the journals have even a more limited circulation. The censor, too, has to be reckoned with, and no advertisement either in newspapers or by means of circulars, brochures or placards is allowed until the matter has passed him. There are a good many restrictions as to what may be said, and I was told by a leading advertising agent that such statements as "Ceylon tea is the best" or "Ceylon tea is preferable to China" would certainly be struck out. I asked whether in a brochure one might mention the fact of the Czar having accepted a gift of Ceylon tea, and I was told that such a statement would not be allowed, and that the names of members of the Royal Family could not be mentioned in connection with any commercial matter. Mr. Rogivue informed me that as regarded some suggested advertisements by means of magic lantern slides and descriptive lectures, it would be necessary to have the pictures approved of and a licence or permission for each lecture obtained, and that the presence of a Government Officer on each occasion would be essential.

Apart from the difficulties attending advertising in Russia, it must be remembered that nine-tenths of the Ceylon tea which goes into consumption in that country does so mixed with China tea, unacknowledged by the dealer and unknown to the consumer. The continued and extended use of Ceylon tea must for several years to come be as a strength and colour-giving ingredient in the dealers' mixtures. It is plain that for that description of business advertisements would not be of use. I enclose a *pro forma* estimate for a general and extensive advertisement of Ceylon tea drawn up for me by a leading Moscow Agent. The cost, it will be seen, is considerable, say, £4,800 for £3,200 insertions amongst 80 of the leading papers and journals. The advantages of dealing with an Agent are that a larger discount is obtainable, and payment can be made at the end of each month, after the advertisements have appeared.

THE ATTITUDE OF THE RUSSIAN DEALERS TOWARDS CEYLON TEA AND THEIR USE OF IT.

Speaking generally, the attitude of all the large Russian dealers is not a friendly or appreciative one. They are conservative in their trade, and they regard a new product as likely to bring in new dealers and possibly unsettle their Agents and customers. They would, I think, prefer that Ceylon had not appeared upon the scene, and most of them have, as it were, been driven in self-defence to handle a product that a few years ago they would not have touched, and which they declared was unsuited to the Russian taste and mode of drinking tea. The chief reason given me for the proportion of Ceylon tea now used by almost every packer was that the quality of China tea had fallen off and that Ceylon tea had to be used to give strength and colour to the mixture. The great cry, however, seemed to be for cheapness, and the lowest priced China leaf supplies the quantity, while a Ceylon tea gives the strength. I found the importers quite alive to the advantage which the lower exchange gives to China tea, and

I heard the opinion expressed that the consumption of Ceylon tea would not increase, and might, indeed, decrease owing to the lower sterling cost of suitable China tea.

MR. ROGIVUE.

I visited all of Mr. Rogivue's establishments in Moscow, as well as that of his Agent in Kief, and I inspected the shop which he has secured, and is about to open, in a capital position in Odessa. I am able now to form some idea of the great difficulties he had to face and overcome, and the Thirty Committee has never in my opinion spent any money to greater advantage than that spent through Mr. Rogivue, who might well claim much of the credit for the present satisfactory consumption of Ceylon tea in Russia.

RUSSIAN TEA IN THE CAUCASUS.

From all I heard of the cultivation there, I do not think Ceylon has much to be afraid of. Of course the cultivation could not be carried on at all but for the heavy protection afforded by the import duty, and the general opinion seemed to be that with the chance of the Government putting on an excise duty (if the production ever became seriously large) and the difficulty of getting labour, it was unlikely that much land would be opened out. The sample of tea I saw was of very fair quality, and I believe most of the tea is sold in Kief.

SUMMARY AND SUGGESTIONS.

Every fact I learned and almost every opinion I heard leads me to the conclusion that while Ceylon tea has got a firm hold in Russia and will more and more go into consumption there, the market is not one to be carried by assault, and we must be content to see and stimulate a steady annual increase. When we consider the opposition and the various retarding influences, nothing could be more encouraging than the almost ten-fold increase which has taken place in the last half dozen years. The mixture of Ceylon tea with China will gradually accustom the Russian taste to a stronger and more flavory beverage, and eventually pure Ceylon tea will be appreciated and asked for, but for a good many years to come, I think the great bulk of our tea taken by Russia must be consumed mixed with that of China. It does not much matter to us how it is consumed so long as it is consumed; only were the taste more for our tea in its pure state we could push its sale much more efficiently than we can, so long as its use is for mixing. My recommendations to the Committee may start with a negative one, viz, not to think of appointing a special Commissioner to push the business, as has been done in America. Such a Commissioner would find little to do. He could only come to the conclusion that retail dealers were the people to aim at aiding, and he would find, even with Mr. Rogivue's success as a beacon to attract them, but few people prepared to devote the necessary time and capital to the enterprise. He would find that the wholesale dealers would regard him as a positive enemy to be checkmated in every possible way. The conditions which now prevail will gradually change, and after some years there may be scope for a Commissioner, but at present there certainly is not. I recommend for the present the Committee should

1. Endeavour to get the Russian Import duty reduced, as the greatest aid to increased consumption.
2. Encourage retail dealers in much the same way as they have done Mr. Rogivue.

3. Advertise the merits of Ceylon tea.

The first of these recommendations will be considered a big order, but there is nothing which would aid us more than a reduction of duty and consequent increase of consumption. A very strong case can be made out for a reduction, and as Mr. Chamberlain has expressed his great desire to aid Colonial trade in every possible manner, we could rely on all his influence being used in favour of the request. The request may not be successful at first, but the matter should be constantly kept in the foreground and would eventually have a successful issue.

Having stated that a Commissioner would find it difficult to find retailers prepared to devote themselves to Ceylon tea, my second recommendation may seem rather a contradiction, but there is a difference between the number of retailers required to justify the expense of a Commissioner to supervise them, and the number which the Committee would get into correspondence with, and one result of my third recommendation, if it be given effect to, would be that of increasing the number of retail dealers. My own observation, apart from Mr. Rogive's demonstration, leads me to think that the retail of Ceylon tea in Russia offers a good opening for anyone who, having the proper qualifications, devoted himself to it and had sufficient capital to tide over the first or two.

In making my third recommendation, I do not advise advertising to the extent contemplated in the *pro forma* estimate which I enclose. At first the newspapers advertising should be limited to some selected papers circulating in the towns where pure Ceylon tea is sold, and there would be no difficulty in arranging a contract for that, and, what is more important arranging for the regular verification of the appearance of the agreed-on advertisements. Such advertisements should be general and name no particular dealer, but the dealers in pure Ceylon tea should be informed of the advertising programme, and thus placed in a position to issue their own supplementary advertisements with advantage. As I will shortly have an opportunity of discussing the matter personally with your Committee, I refrain from entering into further details in connection with my suggestions. I found it difficult to obtain in London reliable information on many minor points connected with Russian business. I, therefore, annex a brief memorandum which may be of use to those contemplating business there.

THOS. NORTH CHRISTIE.

3rd January, 1898.

TEA-GROWING IN THE RUSSIAN CAUCASUS.

To the main report by Mr. T. N. Christie on the prospects of Ceylon tea in Russia there are annexures: one of them is an interesting estimate of tea crops in the Caucasus:—

Extract from Russian Newspaper.

The following quantity of tea may be expected to be grown in the Bantoum district during the following years:—

	PLANTATIONS.		Russian Govt.
	Popoff.	Solovtseff.	
	lb.	lb.	lb.
1897 ..	72	180	—
1898 ..	5,041	360	—
1899 ..	12,600	9,000	—
1900 ..	18,900	34,200	5,580
1901 ..	64,800	50,400	23,140
1902 ..	86,400	61,900	52,920
Total expected in 1902—200,526 lb. Eng.			

I think the quantities for 1897 must be considerably more than this. I know Colouze Solovtsoff made more in 1896, and he has a "Little Giant" Roller. (Initialed) T. N. C.

STENNING, INSKIPP & CO'S CEYLON, & C.,
TEA MARKET REVIEW FOR 1897.

INDIAN.—POSITION AND PROSPECTS.—The new year commences with a Stock of 61,673,000 lb., as compared with 54,145,000 lb. a year ago; these latter figures, however, do not include an amount of 2,000,000 lb. that had then arrived but had not been taken into Stock, whereas the total for 1897 includes all arrivals. The Delivery for the year is disappointing, showing an increase of only 2,676,000 lb during a time when taking the quality into account the average price of 9d has offered extremely good value; hence the statistical position can hardly be regarded as satisfactory, and in view of the ever increasing supply there is some ground for apprehension concerning the future of prices for teas of poor quality. Consumption at home having now reached a high figure, further expansion in this direction can only be looked for on a gradual and small scale, and it would seem therefore that the main outlet for the increased production of coming seasons will have to be found in outside markets. In these circumstances it is encouraging to find so large a quantity of Indian growth already being taken for Australia, New Zealand, Bombay and Canada; but in the United States, where it was hoped ere this a large market for our teas might be found, progress has been but slow, and this is the more disappointing when the money, time, and labour given for some time past are considered.

JAVA.—38,905 packages have been brought to auction, against 39,666 packages in 1896. The quality of the Imports generally is still satisfactory, the liquors being fairly strong, and the leaf very well made.

CHINA TEA.—In our Annual Review of 1896 we alluded to machine-made teas from China. During the present season several parcels have arrived from Foochow, which consisted principally of very small lots; the leaf generally was fairly well made, but the colour of the infused leaf was too dark, and the teas had been too highly fired. They met with a poor reception, and sold at prices which are stated to be unsatisfactory to the Importers. Hardly any of this New Method Tea has been received from the North of China.

CEYLON.—THE COURSE OF THE MARKET.—The dulness that marked the closing auctions of 1896 continued into the early part of January, when a better demand took place, which was maintained throughout February, and in March whole leaf tea fractionally advanced, whilst fine kinds declined; no alteration took place in April, but in May a good enquiry sprang up, common kinds hardened, and fine sold at firmer prices, due to increasing scarcity. Owing to poor quality, in June all teas but a few finest gave way. The low range for common and medium teas attracted competition in July, but without influencing quotations, whilst fine tended upwards. Very large auctions took place in August, and as the quality showed some improvement, the competition was good at firm prices for desirable teas; this position was maintained until the middle of September, when smaller totals of better quality led to a brisk enquiry at full rates, and in the case of fine invoices to an advance, which was kept up during October; the commoner grades being in less supply, went a little dearer. Although in November totals at auction were small, there was less activity, and all teas went in favour of buyers. The enquiry continued slow throughout December, except for a few useful invoices which were well competed for at the closing auctions.

SMALL BREAKS.—As we have previously notified, lots of less than 18 chests, 24 half-chests, or 40 boxes, are reckoned as "small breaks;" occasionally during the year the proportion of these in the auctions has been excessive, and we would here repeat the remarks in our Circular, 4th March, "it would greatly facilitate business in every way if larger breaks, particularly of the lower descriptions, could be sent forward, and it seems to us that this might be managed in the case of many gardens by sorting for fewer grades." With the increasing totals coming to auction it is to the producers' interest to avoid small breaks, as many buyers have no time to examine them, and confine their attention to the larger parcels.

QUALITY.—The proportion of finest invoices has been somewhat small, but there has been a fair selection of useful parcels; common descriptions were plentiful, and often of very poor character, especially so in the case of Colombo purchased teas, for which the offers made here were exceedingly low.

LOSS IN WEIGHT.—As this occasionally gives rise to much dissatisfaction we offer the following suggestions: that the gross weight of the package should be a few ounces, say four or five, above an even number of pounds, and that the empty package, complete with lead, nails, bands, &c., be to a like extent below an even number of pounds. In weighing here the gross weight is reduced to the even number of pounds, whilst the tare is increased to an even number of pounds. With regard to garden bulked teas, it is imperatively necessary to put an equal quantity into each package of the break, and this quantity should be four or five ounces over the desired weight of content, viz., if the packages are invoiced to contain 100 lb. tea each, not less than 100 lb. 4 oz. should be weighed in; test packages, weighing here a fraction under 100 lb., are reckoned as 99 lb. only, or a loss of 1 lb. on each chest of the break.

Careful observance of the foregoing precautions will prevent loss and disappointment.

DRAFT of 1 lb. per package on all packages grossing 29 lb. and upwards is allowed to the buyer.

WEIGHT OF PACKAGES.—When a gross weight of 129 lb. is exceeded, there is an additional charge of 5d per package up to 159 lb. The following scale of charges fully explains this and deserves attention:—

Dock and Warehouse management rates, subject to an uniform discount of 10 per cent, on packages grossing as under are:—

160 to 199 lb.	130 to 159 lb.	90 to 129 lb.	80 to 89 lb.
2/9	2/3	1/10	1/8
60 to 79 lb.	45 to 59 lb.	35 to 44 lb.	17 to 34 lb.
1/5	1/2	1/-	-/7

MARKS ON CHEST.—Nothing is wanted or is of any service here beyond (1st.), Garden Mark; (2nd.), Description of Tea; (3rd.), Garden Numbers. Gross, tare, and net, are not of the least use, and should be discontinued.

METAL PACKAGES.—There is practically no objection to these now, except on the part of some Continental buyers.

PACKING SMALL BROKENS AND DUSTS.—Special care should be taken to pack broken descriptions which are so liable to lose in weight, in strongly made wooden packages. Dusts should be packed in half chests, either of metal or of strong iron-hooped wooden packages; canvas coverings should in no case be used, as they disguise injury done to the packages by rough handling, and any tea retained in the canvas becomes of no value.

NOTES ON BALANGODA-BAMBARA-BOTUWA.

A NEW CEYLON TEA DISTRICT.

John Dent Young's cart road trace—some eleven miles of which are being cut to Vevelkettiya—is nowhere steeper than 1 in 35 and goes in at Meriakotta and I think is 32 miles from Ratnapura. From Vevelkettiya a branch will be cut to

Vevelwatte where the huge Hopewell Company's Factory to turn out 1,250,000 lb. of tea, is being made. Hopewell, Bamberellakanda, Alupola, Wewelwatte, Ballacotum and perhaps later Agar's Land and Welewalamukclana teas may be made here. All the machinery is to be worked by electricity and Mr. Pottie is the engineer.

After seventeen miles of road to Hapugastenne is out, surely, Government won't stick at the other fifteen required to connect Maskeliya with Ratnapura, which was long ago advocated, but as Mr. Wace, in his Report of Sabaragamuwa, then said there was no trade and no justification to cut this road. No one will say so now with the thousands of acres opening and busy life and trade going on as far as Hapugastenne, 17 miles up and 4 miles further, when Kondrugalla is opened this year. This road will be a safe outlet for Maskeliya with a Railway slip on. This trace of Johu Dent Young's is rideable now from Ratnapura to Hapugastenne, and from there on to Hopewell and other estates, and on to Balangoda; the section from Hapugastenne to Rasagalla being made rideable by Mr. James Gray. The branch off at Kondrugalla is about twelve miles, and this portion of the trace is overgrown and very wild, and passes just by Kondrugalla Estate (coffee in 1848) bungalow; this is being cleared and cut into bridle-road now.

The Ratganga, one of the principal branches of the Kaluganga flowing past Hapugastenne Estate, the Walawaganga flowing through Wallaboda and Walawadowa past the Balangoda Hospital, and the Kelaniganga going through Gartmore, all take their rise from the true source, viz., a place called Diatalawa or Dictalawa on the top of the Maskeliya ridge. This is a hollow natural dam or swamp full of diaparra trees, swampy marsh and wallowing elephants. This is the true reservoir and natural source of Ceylon's three rivers. It was a foolish idea to think the Walawaganga rose in Walawadowa block, any one, the least bit acquainted with the country could see such a large stream did not rise only in 1,000 acres of forest but far beyond it. It is true it runs through the middle of it; but its real source is from Diatalawa, and there are numerous other small streams join in from the whole of Maskeliya range, composed of thousands of acres to say nothing of the streams from Detenagalla, &c., and from Bogawantalawa-Fetteresso. The Bihuloya joins the Walawaganga and all the water of the Horton Plains about Denegama, &c., and then to say that 1,000 acres was the source of this fine river and to fell that would dry up the Walawaganga was a very fetched notion. Diatalawa (which means "water flat"), where the actual and real source of the Walawaganga commences, is also the source of Kaluganga, and Kelaniganga, as streams running out of Diatalawa a hollow flat marshy reservoir situated on the ridge of Maskeliya range. This is the source of three of Ceylon's principal rivers, and in Ceylon geography it says, they take their rise from or near Adam's Peak! Constant streams of coolies and artisans in search of work from Maskeliya, and other places use the road now, where once all was jungle and elephants reigned supreme.

I should say the big firm or Company have opened nothing under 3,000 acres of clearings last year in this District and that they own quite 10,000 acres land.

The cart road starts from the burial ground, or turn off at outer circular at Ratnapura, crosses by ferry at Malwola where the Bamberabotua and Kuruwitte or Gillemalle River join and make the Kaluganga, and a few miles lower down, it becomes navigable for boats. The road goes to Vevalkettiya Estate, and where old John Dent Young in the days gone by (1848) had a rice store for the Hapugastenne and Kondrugalla Coffee Estates. From here the branch road is to go on to Wewelwatte. The rideable road from Hopewell to Hapugastenne is opened, and now shown in Surveyor Generals maps and plans of the district as connecting Balangode with that part of the country and an

outlet from there to Bogawantalawa via Agar's Laud is made into a ridable road, and Mr. Horsfall's horse was the first to pass over it. Mahawale estate is closest to Ratnapura, and is owned by the Mahawale Tea Co., Ltd.,—when completed it will be over 600 acres. The cart road goes through the estate, but I expect it will be over a year before the section from Malwala to Ratnapura (or vice versa) will get finished (5 miles) for cart traffic and from there to Wewalwate is another 11 or 12 miles, but the difficulties are so great that it will take years to make, and may even have to be abandoned in monsoon months before completion. The Company have leased the old stones used in coffee days by the Commercial and Uva Coffee Companies. These will present a lively appearance and busy all over when tea, rice, tea seed and machinery and factory fittings come pouring in, but at present are being used on a small scale.—H. J.

NORTHERN DISTRICT'S PLANTERS' ASSOCIATION, CEYLON.

THE ANNUAL REPORT.

After the signing of the minutes of last meeting the Hon. Secretary read the following report of the past year's work:—

During the year two general and four Committee meetings have been held in Kandy. The change of venue has not been quite so successful in securing a larger attendance of members as could have been wished, though the improved train service is now as convenient, as could well be arranged.

The roll of members is slightly below last year's muster, 88, being then reported as having paid subscription against 85, this year, but several votes have been lost through groups of estates being incorporated into Companies, which register only one vote for the whole group. Your aid is unvoked to try and get in new members in the current year. Balance at credit Association is R79'03 against which is due to Mr. E. E. Green R75 for his book on Coccidæ of Ceylon.

Tea crop estimates have been collected with considerable care with results that may be regarded as satisfactory, no less than 6,734 acres being reported as not yet in bearing, not including considerable acres being opened by native cultivators. Efforts were made to get in some of these figures, but letters to proprietor or superintendent were returned through dead letter office as "not called for." The only effective way in future will be to try and get figures from the larger factories buying leaf.

Figures collected to date are as follows:

40,294 acres planted 33,560 in bearing 14,652,650 lb. tea. To these must be added:—

2,492 acres planted and 2,371 in bearing, no returns received, estimated to yield .. 1,184,800

Total .. 15,873,450

Against last year .. 14,114,891

Showing increase of .. 1,732,559 lb.

	Acres.	In Estate	Yield.	Average.
	Planted.	Bearing.		
Allagalla ..	2,366	1,903	1,042,500	547
Kegalla ..	1,860	1,337	670,000	501
Knuckles ..	4,261	3,957	1,705,500	431
Kelchokka ..	4,712	4,455	1,723,000	386
Hunaseria and Elkadua ..	3,030	2,981	1,147,000	384

Rangala and Madamahalanuwara ..	5,889	5,194	1,711,400	329
Nilambe ..	—	—	1,136,100	—
Hantane ..	5,512	4,575	2,288,400	500
	42,786	35,931	15,837,450	—

17,000,550

Average per acre 440 lb.

Hantane and Nilambe are bracketed together in order that the figures may agree with those arrived at by the sub-Committee appointed to deal with the official estimate of the tea crop. The Secretary has not the acreages of the Nilambe District either planted or in bearing, but has added the figures giving as approximately the yield of the Nilambe District, excluding estates which were included in Hantane.

Railway Time Table.—The efforts of the Association to get an improved service on Matale-Kandy line may be regarded as satisfactory as regards the travelling public, though complaints are made against the mail service since night mail was taken off.

The new time table practically received unanimous support from members present at various meetings and deputation and the thanks of the Association are due to His Excellency the Governor and to the General Manager, C. G. R. for the concession of afternoon trains. The thanks of the Association are also due to the General Manager and staff for their efforts to meet the convenience of travellers and consignees of goods during the serious interruption of traffic caused by the big slip on the Allagalla incline.

Ukuwela.—Efforts are being made to try and get a siding here for loading and unloading goods, a want which is very much felt.

Hill Tramways.—Although Teldeniya returns showed that a steam tramway would at once give good returns, nothing more has been heard of the results of meetings, &c., in the Rangala District and of reports sent in to the commission.

Post Office.—It is to be regretted that equal energy was not displayed by this Government Department. Bitter complaints have been very general of the irregularity and infrequency of mails throughout the district caused by non-use of goods trains and extra runners during the block on the Railway incline.

The Ukuwela office still remains only a receiving office in the hands of the Station Master, C. G. R., much to the inconvenience of residents in the district. The efforts to secure a proper Post office this year being unsuccessful owing to the "several more urgent cases where Government is unable to sanction for the present the necessary funds."

Labour.—Generally the districts have been better supplied this year, large numbers of coolies having come in from the coast. The proposed labour federation is in the hands of Parent Association and matters may be left to your committee. A sub-committee has drawn up a set of rules, which has been adopted by General Committee to be brought before next annual general meeting. Your committee commend the Federation to the hearty support of proprietors and Superintendents in the district.

Benevolent Fund.—This is deserving of more general support and the Committee urges on members its claims and would refer them to the last annual report recently circulated for evidence of its usefulness.

Mines & Machinery Ordinance.—Rules in connection with this new ordinance have been sent by Government for circulation among members and copies were recently posted out.

Ferguson Memorial Hall.—The foundation stone was laid by Her Excellency Lady Ridgeway in Kandy on Tuesday 29th June, 1897, and the contractors are now busy at the foundation trenches. So we may hope ere long to see the walls rising.

Indian Famine Fund.—Your Association made special efforts to secure support and nearly R1,400 were collected and sent in to Mr. Philip.

Consulting Entomologist.—His Excellency deserves the thanks of planters for allowing a small grant to Mr. Ernest Green, Hony. Consulting Entomologist, for conducting experiments. Mr. Green has drawn up a scale of fees and his services are at the disposal of members on very reasonable terms.

Cacao Discasc.—Mr. Willis, the new director of Botanic Garden, Peradeniya, has been very energetic in publishing three numbers of a circular on this subject, all of which have been reported in the local papers, and copies have been sent to most of your members through the courtesy of the Director, Royal Botanic Garden.

His Excellency the Governor thought the matter of sufficient importance to make special allusion to it in his address to the Legislative Council on November 5th, 1897. His efforts to secure a Cryptogamist from Kew were unsuccessful largely through the adverse report of Mr. Thiselton Dyer, but private enterprise has stepped in and a sub-committee has been appointed by Parent Committee in Kandy to communicate with Mr. Dickenson with a view to steps having taken to carry out arrangements connected with the Cryptogamist's investigation.

Licensing Boutique-keepers.—The Dimbula resolution on this subject received the unanimous support of the Association. It is on the same lines as N. D. P. A. registration scheme which is familiar to you all.

The thanks to the Association are due to the Parent Association for their courtesy in allowing us the use of their rooms for our meetings.

Obituary.—We have to regret the loss of your late Secretary, Robert N. Anley and of Mr. Penny and Mr. G. W. Rudd. Owing to the lamented death of your late Secretary a new one had to be appointed and Mr. Chas. Gibbon undertook the office again in April last, to whom thanks are due for the interest, energy he has shown.

CEYLON TEA IN RUSSIA.

Appended to Mr. T. N. Christie's Report, which we publish on another page, are several tabular statements. One shows the import of tea at the European frontiers of the Russian empire during the period 1887-1896, the total in the last named year being 887,000 lb. against 591 lb. in first. In the next table there is shown the quantity of tea imported into the whole of the Russian empire during 1896, the total of green tea of high quality being 113,998 lb., of green tea of low quality 14,739 lb., of block tea 1,444,154 lb., of brick tea 987,817 lb., and of slab tea 45,422 lb. From these quantities after inspection were forwarded for clearance, (1) to the Askhtbad Custom House 28,554 lb., to the Bokhara Custom House 42,676 lb., and (2) to the Bokhara Custom House 12,062 lb. Another table is given in which is indicated the quantity of tea on which duty was paid, as also its value on importation into Russia during 1894-1896. Following that there is a translation of section 20 of the Russian Customs tariff and the following:—

RATES OF DUTY ON TEAS.

European frontiers Roubles 21., gold, per Poud or £10 10s 8d. per cwt.—1s 10½d. per lb. English.

Siberian Roubles 13., gold, per Poud or £6. 3d. 4d. per cwt. 1s 2d. per lb. English.

There is also appended a copy of the principal articles of the treaty of commerce and navigation between Her Majesty and the Emperor of all the Russias.

RUBBER CULTIVATION IN CEYLON.

The fourth circular issued by Mr. Willis, Director of Botanic Gardens, affords a very good and useful summary of information on the subject of "Rubber," although, so far as we can see, there is nothing specially new, and a good deal of the practical information is taken from the Reports of the Forest Department. Mr. Willis tells us that the world's consumption of rubber is now over 100 million lb. per annum worth more than 10 million sterling and nearly half of this comes from Para. We shall be compiling full statistics shortly for our Handbook and will be able to verify these estimates. The discovery of the new rubber-yielding tree *Kickxia africana* has met the increasing demand and kept prices

down; but the reckless destruction of trees in collecting must erelong tell. Mr. Willis proceeds to give an account of the Para district, the estimate and soil suited for *Hevea* (the Brazil rubber), the mode of planting, rate of growth, the mode and yield in tapping. He shows that tappings at weekly intervals of trees about 2 ft. mean girth in 1897 gave a return of 5·17 oz. per tree. Heneratoda experiments point to 90 lb. rubber per acre after 20 years—not very encouraging; but Mr. Willis thinks better results can be got by planting closer and tapping earlier. As to cost of opening plantations, he takes R75 per acre for cost of 300 acres of land and shows a total outlay of R75,777 up to the 10th year or with interest at 7 per cent. R110,000 equal to R366·66 per acre. Taking the yield in the 10th year of this properly planted plantation at 100 lb per acre we get a gross return of £10 or R150 per acre, and taking R50 for cost of harvesting, carriage to London, &c., we get R100 an acre, or 27 per cent. on outlay leaving an ample margin for contingencies and satisfactory profit. The circular will be found on another page.

NOTES ON RUBBER GROWING IN PERAK.

MEMORANDUM BY MR. L. WRAY, CURATOR AND STATE GEOLOGIST, PERAK.

The first seed of the Para rubber (*Hevea brasiliensis*) was introduced into Perak in the year 1882 by Sir Hugh Low, the then British Resident. It was sent to me to plant, but did not germinate, having been kept too long after picking. A second lot was received a short time after and was planted at Kuala Kangsar; so that the larger trees there are now about 14 years old. In 1887 some seed was obtained from the Kuala Kangsar trees and planted in the Museum grounds, Taiping. The soil is very bad, the land having all been mined over, but still the trees have grown well and have attained, in the ten years which have elapsed since they were planted, a considerable size. Finding that they grew so well I ventured, in 1891, to write to Sir F. A. Swettenham, the then British Resident of Perak, suggesting that they should be planted on waste lands, and, as a result, Mr. O. Marks, then Superintendent, Government Plantations, put out a number of trees at Kuala Kangsar, which are now about six years old and are doing very well.

It may be stated that it will thrive in any locality, from the *bakau* swamps to the foot-hills, and on any soil, from rich alluvial to old mine heaps.

There is little to guide one on the subject, but from 15 to 20 feet apart would appear to be about the correct spacing. At 20 feet it might be necessary to plant something in between to keep them from early branching, but this would not be necessary at 15 feet. In Larut, at an estate at Kampong Dew, they are being planted at 10 by 10 feet, that is 544 per acre. It is very close, but it is the intention, I am informed by Mr. Waddell Boyd, the manager, to thin them out later on to 20 by 20 feet or 108 per acre, tapping the intermediate trees—that is, those which are ultimately to be thinned out—as early as possible and as severely as they will stand, while the others are allowed to grow to a large size before tapping.

With a view to giving some data respecting the growth of the trees, I have measured some of those in the Museum grounds. These trees, it is to be remembered, are 10 years old and are planted on mined land of the poorest quality.

For 13 trees the mean height is 74 feet and the mean girth at 3 feet from the ground is 4 feet 2 inches. This gives a mean annual growth in height of 7 feet 3 inches, in circumference of 5 inches and in diameter of 1·6 inch. The greatest difficulty in planting Para is the very short time which the seed remains good after it falls from the trees. The time which

elapses before they are planted should not under any circumstances be longer than a week, and if they can be planted before this so much the better. Sown at once nearly all germinate, but each day which intervenes increases the number of failures till, at the expiration of ten days or so, none grow. The trees are very prolific seed bearers. Those in the Museum grounds have this year yielded nearly 14,000 seed—or, to speak more correctly, that number have been collected. At 15 by 15 feet, 14,000 seed would be enough to plant 72½ acres of land. Where the land is ready it is certainly an advantage to plant the seed at stake, but where this cannot be done not much loss would follow planting in nurseries and then transplanting. The thing to avoid in this method is the production of double stems near the ground, caused by the original shoot dying out or being broken off. In the first few years a little judicious pruning would prevent this tendency to throw up more than one stem. In other respects they do not require any pruning, nor after the first few years any attention at all except a little cleaning with a parang. The trees are vigorous growing and, have such thick foliage that they would soon cover the ground and effectually keep out all weeds and scrub. Many methods have been suggested and tried for tapping the trees, but what may be called the herring-bone method appears to have advantages over the others. This is the way the Ipoh trees are tapped by the wild tribes of Perak and it is also used by the Malays for tapping trees yielding bird lime etc. The American rubber collectors also adopt the same method for tapping *Castilleja*. In 1888-9 the trees, Para and *Castilleja*, at Kuala Kangsar were tapped by herring-bone cuts by Malays.

On 5th July, a rubber tree in the Museum grounds was tapped by a herring-bone incision in the bark of the trunk about ¼ inch wide and reaching down to the wood. The cuts were widened several times to ultimately about ½ an inch. By the 7th October, the cuts were closed up with a new growth of bark. Three months is therefore sufficient for the covering over of ½ inch wide cuts made right down to the wood. The best places to heal over were those where the side cuts met the vertical one. Here, of course, the width of exposed wood was considerably more than half an inch. The best way of carrying out the herring-bone method of tapping is a matter of much importance, as on it depends the cost of the collection of the rubber. Common knives, chisels, chopping knives, purning knives, etc., are quite unsuited to the work, so I devised an implement for scoring the bark which apparently answers the purpose in a satisfactory manner. The handles are made like a boat-builder's draw knife, but the cutting blade is shaped like the letter U and fixed by a suitable set screw or wedge in the bar joining the handles and in the same line with them. In cutting a herring-bone incision the knife is taken in both hands by the handles and a long vertical cut made in the bark, but not so deep as to reach the sap layer. The blade ploughs out a furrow having the same section as itself and of a depth corresponding to the inclination at which the instrument is held in relation to the surface of the bark; the set of the handles giving complete control over the direction of the blade. The side cuts may then be made to the same depth. Having gone so far and having cleaned away all the loose cuttings of outer bark, the receptacle for catching the sap may be fixed at the lower end of the vertical score, and then beginning from the top of the cut it may by a second application of the tool be deepened to the proper extent. By following this procedure waste of rubber may be avoided to a large extent and a cleaner product obtained. The same instrument can of course be used to enlarge the scores for the subsequent tapplings. The scoring knife will, I think, be found to quite halve the time in tapping the trees and do the work in a much better fashion as well. The receptacles for catching the sap can conveniently be made as follows. A tin can is fitted with a sort of sharp straight-edged lip at one side and a hinged lid to keep out fragments of bark, rain water, etc., and it is best and quickest hung on to the tree by a couple of

attached wires furnished with sharpened hook points. In this way there is nothing required by the collector but his scoring knife and tins. He wants neither nails, hammers, wet clay, knives, chisels or the other things now in use. Mr. J. C. Willis, Director of the Royal Botanical Gardens, is trying a method of tapping; with small detached V-shaped incisions, made with two cuts of a chisel having a wide blade of about an inch in breadth. These cuts I find heal up in a very short time and do little damage to the tree, but it is doubtful if they will yield as much rubber as the native herring-bone shaped cuts. Mr. Willis informs me his experiments are not yet complete.

Some years back an instrument for tapping was recommended of the following description. A piece of wook about an inch broad and a foot or more long had the central portion set with sharp steel spikes like the hair of a brush. It was to be taken in both hands by the ends, which served as handles, and the spikes pressed into the bark, producing a series of punctures through to the wood. On trial in Perak, on the Kuala Kangsar trees, it was found that although the sap flowed when it was applied in fair quantities, it stopped almost at once, as the holes quickly became sealed up by the coagulation of the sap within them.—*Malay Mail*, Jan. 19.

TAPING, 4th Dec. 1897.

BRITISH CENTRAL AFRICA.

We have received the following notice with reference to last season's coffee sales. The coffee in question was grown by Mr. S. Israel on the Chipande estate. Messrs. Garner & Co., have written as follows to Mr. Israel:—"The prices for your coffee sold are most satisfactory: in fact that is the best sale that has ever come under our notice of British Central Africa coffee, and we must congratulate you on the very excellent turnout. The average price obtained of 100s per cwt, the lowest, 15 bags, 78s per cwt, the highest, 18 bags, 114s per cwt.

CALOTROPIS PROCERA AND GIGANTEA

Liottard, in his pamphlet "Materials in India suitable to the manufacture of paper" says, that "in the Punjab the fibre is available from the branches of *C. procera* by cutting down the largest branches in October and November or April and May, or the periods when the *muddar* blossoms and just before it ripens its seed." The plants, wherever I have observed them, seemed to be almost in perpetual blossom and the fibre, if I remember aright in Sind is available from *C. procera* all the year round. Of Thana I am not in a position yet to speak; but I may mention that I have extracted the fibre from *C. gigantea* when not in blossom. Whether the fibre extracted is of use or not commercially I cannot say, but there seems no difference in its quality. I may satisfy those like Mr. Gleadow, however, who possess qualms of conscience as to the quality of *C. gigantea* and *C. procera* being equally good, by saying that Mr. Macdonald the expert who experimented with *C. gigantea* fibre in November last in the Konkan declared it to be excellent. I had sent home specimens of *C. procera* fibre to his firm and it was entirely owing to the excellence of the quality of this fibre that Mr. Macdonald was induced to come out to India.

Apart from this, if authorities such as Dalzell (Bombay Flora in 1861, page 14); Drury, (Useful Plants of India 1873, page 101); Liottard and Royle, (Fibrous Plants of India 1855 pp. 306 to 3.0), are consulted, the assertion that the fibre of both plants is equally good will, it is thought, be found to be confirmed. The only questions to be solved, I think, now are, whether there is sufficiently large quantity of the fibre available from *C. procera* and *C. gigantea* in their natural state to render it marketable in various parts of India and if not whether there are areas which can be taken in hand for the artificial production of the plants, and whether any machine will extract the fibre

in a merchantable condition. On the latter point, I may say that Messrs. Boyle & Co.'s representative, Mr. Macdonald, visited Thana in November, but not with his machine, and after conducting experiments with the cut stems of *C. gigantea*, came to the conclusion that his machine, which is utilized extensively in the Straits Settlements for extracting Rhea fibre, could extract fibre from *C. gigantea* with certain slight modifications. He is so convinced of this that he has addressed the Bombay Government to obtain certain concessions to exploit the fibre in Bombay for a lengthened period. The action taken by Messrs. Boyle & Co. tends rather to upset the conclusions previously come to by Dr. Watt, who conducted experiments on the fibre in conjunction with Mr. Cross of Lincoln's Inn and who says (Dictionary of Economic Products Vol. II. page 40.) "The opinion we arrived to confirms the verdict already given that the mechanical difficulties are too great and the ultimate fibrils too short to justify high hopes being entertained of Madar bast fibre becoming of any great commercial importance, although its great beauty makes one resign it with regret."

Mr. Gleadow appears to be of opinion that the plant is of such a straggling light-demanding habit, that it could not probably be grown dense enough to give any considerable yield: but he seems not to have made any experiments on the point. In *qur. Strettell's pamphlet on C. gigantea* published in 1878 (page 73) he gives the yield of fibre per acre at 582 lb. or 727 lb. where waste is guarded against, and I have never seen his estimate controverted.

30th Dec. 1897.

G. M. R.

—*Indian Forester.*

THE FIXATION OF ATMOSPHERIC NITROGEN BY DEAD LEAVES.

Following the important work of M. Henry, whose successful research will be doubly grateful to many Indian foresters for reasons of personal regard, comes a note by M. L. Detrie on the same problem, *viz.*, the reasons for the continual improvement of forest soils, notwithstanding the fact that more nitrogen is removed from them than is known to be acquired by them. The disastrous results of the removal of dead leaves, causing sometimes a loss of as much as 50 per cent., of the normal annual production, are well known to foresters, but have not yet been borne in upon the unwilling minds which oppose forest conservancy. This loss, at any rate the most serious loss is nitrogen. As regards sufficiency of other food supply, it may be granted that all soils, all waters, all atmospheres are rich enough to keep forests growing for ever. The mineral constituents, salts, &c., necessary to the continued formation of cellulose, starch and other reserve materials, are always to be found in sufficient quantities, resulting from decompositions or recombinations in the soil or atmosphere. But nitrogen, the indispensable, the arbiter of the rate of growth, even of life and death, is an extremely variable quantity. The German experimental stations proved the amount of loss growth caused by the removal of dead leaves. M. Grandeau showed that the covering of dead leaves has a great influence on the amount of nitrogen carried in the soil. Then came the knowledge of the important part played by micro-organisms, moulds, ferments, microbes &c., in the decomposition of vegetable matter, and it was seen that the layer of dead leaves is not only a layer of partly digestible food material, but is especially a layer of microbes, ferments, &c., a kitchen in fact, where the indigestible materials are rendered easily assimilable. It follows that the mere raking about of the layer, not to speak of its removal, interrupts the microbe-cooks and the scullion ferments at their work, and may even kill and bury them under the ruins of their kitchen.

The removal of leaves is thus a wasteful process, since the benefit accruing to the robber is far less than the damage caused to the forest. About this period, namely June 1893, M. Detrie just glimpsed the conclusions which M. Henry has worked out,

since he wrote that "the removal, or mere moving, of the layer of dead leaves, not only interferes with the formation of vegetable mould, but actually diminishes the fixation of nitrogen in the soil by stopping the development of micro-organisms." It remained for M. Henry to decipher the details. Even yet, there are illegible lines at the bottom of the page, and M. Detrie asks for an interpretation. Granted that the increment is affected by the chemicophysical action of the layer of dead leaves, how can this be reconciled with the admittedly greater increment in the standards after the cutting of the coppice, that is to say, at a period when the layer has been practically destroyed? M. Bartet's experiments showed that in high forest of 3 ages, up to a height of 9 m. 30 cm, the curve of diametral increment is inflected from the 1st to the 3rd decennial period, that is, inversely to the thickness of the layer of dead leaves. The cause of this greater increment is not explained, although theories more or less at variance with existing knowledge have been propounded. The problem has puzzled M. Detrie for the last 10 years, perhaps some Indian forester can throw light upon it.—*Indian Forester.*

INDIAN SOILS AND DIFFERING AUTHORITIES. —The final Report of Dr. Leather as the subject of consideration in the *Indian Agriculturist* and from the conclusion of its article, we quote as follows:—

Professor Wallace, of Edinburgh, it will be remembered, in his work on Indian Agriculture, answers with an emphatic negative the question whether the fertility of the soil is being exhausted by native practices. "Temporary fertility, the qualities possessed in virtue of some accumulation of material useful to plants, may," he says, "be dissipated; but when this is gone, no system of cropping can reduce the land to a lower point. The greater portion of the land in India which is not newly broken in, annually produces its minimum yield. Where declining fertility has been recorded, it was no doubt due to loss of temporary fertility which had accumulated during a period of rest." Dr. Leather, however, points out that the distinction between temporary and natural fertility of soils is only a question of terms, and maintains that, while "the presence of a store of 'temporary' fertility in the past may or may not be the case, the opinion that a soil cannot be reduced in fertility below a certain level is one for which there is absolutely no proof; on the other hand, we have the fact that in the Rothamstead and Woburn experimental fields in England, crops which have been grown for so many years without the aid of manure, do annually become less and less, and the limit (if there be one) has not so far been reached." However this may be, moreover the fact, as he points out, remains, that it is much more important to consider how the fertility of the land can be increased than whether it is becoming exhausted. It is beyond doubt not only that the fertility of the land in India is low compared with that of the land of other countries, but that, if it is not decreasing, it is certainly not increasing, and, with a better supply of manure, it would be at once increased and more grain produced per acre. For that better supply of manure, he is rightly of opinion that there is, under Indian economic conditions, but one principal source, *viz.*, the dejecta of the animals and human beings that consume very nearly the whole of the grain crops; and "it is in the more perfect direct (not indirect) return to the land of these matters, that one can look for an increased manure supply; an increased fertility an increased output of food-grain." As bearing on his remark that the fertility of the land in India is low compared with that of the land in other countries, Dr. Leather states, it may be noted, that, of all the Indian soils he has met with, the only soils to which the term "rich" can be at all applied were from a single limited area, *viz.*, a coffee estate in the Shevaroy Hills.

PLANTING NOTES.

FIBRE INDUSTRY.—We direct attention to an interesting extract from the *Indian Forester* in our issue in continuation of what has already appeared about the fibre got from different species of *Calotropis*. It will be observed that Mr. MacDonald (of Ramie fame) reports very favourably of *C. gigantea*—the "Warra" of the Sinhalese. We must watch the further development promised in India.

"THE QUEENSLAND AGRICULTURAL JOURNAL," for Jan. 1898—Contents:—Students at Agricultural Colleges—The Queensland Agricultural College—Wagga Experiment Farm—Agriculture: Green Manuring and Farm Drainage—Dairying—The Orchard—Entomology—Botany—Economic Botany—Tropical Industries: Ramie Cultivation, Coffee prospects in Queensland, On Fibres, and The Coconut (*Cocos nucifera*)—Bacteriology—Chemistry—Pisciculture—Forestry—General Notes—The Markets—Farm and Garden—Notes for January—Orchard Notes for January—Tropical Farm and Garden Notes for January—Publication Received—List of Errata in "Insect Friends and Insect Foes"—Public Announcements.

SOME RARE AND EXPENSIVE DRUGS.—A writer in the January number of *Chambers' Journal* throws some interesting light on rare and peculiar drugs. Saffron, he points out, would strike an ordinary observer as decidedly expensive at 56s a pound, until told that it is composed of the central small portions only of the flowers of a Crocus, 70,000 of which it takes to yield the material for one pound. Otto of Roses sells as £28 odd per pound, and it takes 10,000 pounds—or nearly five tons—of Roses to obtain one pound of the oil. Aconitine, extracted from the root of Monkshood, is said to be the very strongest poison extant, the dose being 1-600th of a grain. It is sold at the rate of £27 per ounce!

COFFEE PROSPECTS.—The year is notable, says the *American Grocer*, Jan. 5, for a heavy decline in prices, due to an enormous increase in the crops of the world, only partially offset by an increase in the deliveries, which are reckoned as consumption. The latter shows an increase of over 7 per cent. over 1896. The decline in prices has been most marked in Brazil it sorts and lower grades of mild coffee. On January 1, 1897, the world's visible supply was 4,024,968 bags, since increased to about 6,500,000 bags, notwithstanding the gain noted in consumption. We have recently so fully outlined the position of coffee, and noted each month in detail the movement, that a further review at this time would be a needless repetition. The outlook is for a period of heavy supplies and low prices for at least two years to come. The aggregate of the world's crop is over 2,500,000 bags above present annual requirements.

THE "INDIAN FORESTER," a monthly magazine of Forestry, Agriculture, Shikar and Travel. Edited by J. S. Gamble, M.A., F.L.S., Conservator of Forests and Director of the Forest School, Dehra Dun. Contents. No. 1—January, 1898.—Original Articles and Translations. The Fixation of atmospheric Nitrogen by dead leaves; Imports by Quebracho wood into Germany. Correspondence.—The After-training of Coopers Hill men, letter from Dr. W. Schlich, c.r.e.; India Rubber, letter from J. R. Jackson; *Calotropis procera* and *gigantea*, letter from G. M. R. Official Papers and Intelligence.—Cacao and India Rubber in Mexico (Extract from Foreign Office Report No. 385, of 1895, Miscellaneous Series, by Mr. H. N. Dering). Extracts, Notes, and Queries. Experimental Morphology; British Woods and Forests; Pine Wood at the Cape. Timber and Produce Trade; Extracts from Official Gazettes.

THE KALUTARA PLANTING DISTRICT—to judge by the annual report we give elsewhere—is in a very happy way as regards cheap transport, and a plentiful contented supply of coolies—this latter due to a District Federation. There is encouragement therefore to Federate all round. But in the state of the roads, the Kalutara planter has abundant cause for grumbling, apparently. It would never do for a planting district to exist without a grievance!

NORTH BORNEO RAMIE FIBRE CO., LD. (3,704).—Regd. at Edinburgh, Dec. 20th, with cap. £15,000, in £1 shs, to purchase and acquire from Malcolm C. Thomson, of 25, Hope St. Glasgow, a concession of 5,000 acres of waste land in B. N. Borneo, for the cultivation of Rhea or Ramie and other fibrous plants. The subs. are:—
 M. Thomson, 25, Hope St. Glasgow, mcht .. 1
 A. McRay, 25, Hope St. Glasgow, cashier .. 1
 M. B. Thomson, 25, Hope St. Glasgow, mfr .. 1
 M. B. Thomson, 25, Hope St. Glasgow, clk .. 1
 W. Carswell, 25, Hope St. Glasgow, mngr .. 1
 J. Murray, 82, W. Regent St. Glasgow, C.A. .. 1
 A. Mitchell, 82, W. Regent St. Glasgow, C. A. .. 1
 First directors are M. Thomson, R. King, and R. Paterson; qualn, 100 shs. Regd. office, 82, W. Regent St. Glasgow.—*Investors' Guardian*, Jan. 1st.

TEA CHESTS.—A notice has been received in Calcutta from the Secretary of the Liners' Conference to the effect that "in consequence of the insufficiency of metal chests in practical use" the Conference has decided that no claims for nllage will be paid on metal packages by steamers proceeding from Calcutta on and after February 1, next. A copy of this notice having been sent to the London Association the Secretary applied for information regarding any claims that had been made. The Secretary of the Calcutta Conference states in reply that he regrets he is not in possession of the particulars asked for. The only information furnished by the Liners respecting the matter was that several claims of the class referred to had been made, and as they were considerably on the increase it was decided to carry out the resolution referred to. We understand that a protest has been lodged against the action of the Conference in this matter, and that a request has again been made for full particulars of claims.—*H. and C. Mail*, Jan. 14.

GOLD AND PLUMBAGO IN CEYLON.—A great mistake will be made if the experienced Mining Engineer (Capt. Tregay) who is now open to engagements, is allowed to leave the island without advantage being taken both by the Government and private proprietors to get reports on likely plumbago land or likely gold-yielding quartz reefs. The Government Agent of the North-Western Province must know how much Crown Land is enhanced in value if it is pronounced to yield plumbago, and he ought to point out to Government the great benefit of getting Capt. Tregay to examine and report in likely divisions where land is to be sold. We understand that native proprietors of land are beginning to ask Capt. Tregay for reports. Then as to gold, surely proprietors in the neighbourhood of streams known (by their native names) to yield gold:—Ruanwella, Rangalla, Ramboda, Ranwelle, &c.—will not lose the chance of an expert like Capt. Tregay tracing the matrix quartz from the stream. In the case of the Kelani Valley above Ruanwella, we would advise the District or at least a group of proprietors to associate in employing Capt. Tregay. We know the old objections offered by planters to a gold-rush; but a gold-yielding quartz reef can be worked just to suit the convenience of the owner; no rush can well take place on such a reef.

TEA IN NORTH BORNEO.—We read in the *Herald* Mr. Ballardie and Mr. H. Walker went on up river to Sapong. Mr. Ballardie has come as the representative of an influential Company who are about to commence planting tea near Sapong.

"PLANTAIN FLOUR."—Who can tell us if this article has been prepared in Ceylon, and whether any quantity can be got at this time? There is enquiry for it from abroad and we cannot see why an industry and trade should not be developed in plantain flour, in a country where plantains grow so freely.—See a letter and enquiry elsewhere.

COFFEE RIVALRY.—The report of the Government of India on coffee cultivation affords another instance of the way in which the fortunes of distant and disconnected portions of the earth linked together, says the *Globe*. Take coffee. In the heart of India, a circumscribed zone might be marked out, including the districts of Mysore and Coorg, Malabar and the Nilgiris, which would be practically the whole of the coffee-bearing region under the Indian Government, and if we turn the terrestrial globe completely round, we shall find a similar coffee region on the other side of the world, in Brazil. In spite of geographical distance, when the naked coolie of Mysore finds work scarce and wages low, he may safely attribute it to the fact that prosperity is smiling upon his antipodean counterpart. This fact is very clearly brought out in the report of the Government of India. From 1876 to 1878 inclusive, Brazil was in political trouble, and the Indian coffee grower made such handsome profits that cultivation rapidly extended. Then came India's trouble in the shape of the coffee-boring insect and leaf disease; and Brazil ruled the market, while unremunerative Indian coffee plantations began year by year to give place to tea-gardens. But in 1889 the pendulum swung the other way once more. Science had defeated the coffee borer and rendered plants immune against the leaf disease in India; while American "corners" in Brazilian coffee and fresh political troubles gradually enabled the price of Indian coffee to rise in 1893 to double the price that ruled in 1885. Brazil is still more or less troubled, and the coffee of India still rules high; but assured peace and prosperity in Brazil would promptly send prices down again.—*H. & C. Mail*, Jan 21.

CEYLON TEA IN NORTH AMERICA.—In another column we publish a letter from our Tea Commissioner, Mr. Wm. Mackenzie, in which he points out how the prices of low grade teas are being kept up through orders from Russia and America chiefly, and how the blending houses, not being able to get these teas at their own prices, give less bids for mediums. Shares of recently formed home Companies are stated to be rising and our Commissioner thinks it is almost time for a Growers' Distribution Co. to be formed. With regard to the enclosures these include as the letter mentions the list of eighteen packet teas in Toronto, and instructions to Customs officers to forward to the department at Ottawa, for approval, samples of all tea imported into Canada from the United Kingdom and from the United States before delivery, unless the importer produces a certificate from the British or U.S. Customs that the tea has been duly approved for home consumption in their respective countries; and to exercise due care that tea which is unfit for use and such as is prohibited under the customs tariff shall not be entered for consumption in Canada where thus imported direct or in transit from foreign countries. In such cases if custom officers have reasonable grounds to suspect that a particular tea is not genuine, or that it is mixed with exhausted tea or other ingredients so as to injure its proper quality, a sample of the tea is to be tested at the port of entry.

COTTON GROWING IN SOUTHERN INDIA.—We get very bad accounts of the prospects of cotton growers over the way in Tinnevely; high exchange has so affected the prices offered by the mills and export traders that there is no margin of profit left to the cultivators who, therefore, are not likely to grow cotton in their fields next year, where they can manage otherwise.

CONWAY PEARL FISHERY.—Sir Walter Besant in *The Queen* has the following:—

I have received more details concerning the Conway pearl fishery. As regards the upper reaches of the river the fishery is extinct. It existed, however, continuously from Roman times to about thirty years ago. Probably, therefore, it may be resumed some time with profit. The causes of the decline are said to be partly the demand for eating mussels—to eat a mussel that, if left alone, would produce a pearl is surely akin to killing the goose with the golden eggs—and partly from too great a drain upon the beds, which reduced the size as well as the quantity of the pearls. The time for fishing was between the months of May and August exclusive; during that time "several pounds weight" of pearls were found daily. Mounds from 10 to 15 feet high, consisting of mussel shells and sand, exist in the neighbourhood to show the magnitude of the operations. Last year the Mayor of Conway was presented with a ring set with black pearls from the river. It seems a pity that so picturesque an industry should fall into decay. Meantime, it has interested me greatly to read these details, and to learn that there has been for so long a fishery for pearls in our own country.

GOOD NEWS FOR CACAO PLANTERS.—The extraordinary activity in the cocoa market, and the substantial rise in prices in face of a large supply at the resumption of public sales last week, show—says the *Grocers' Journal*—what a change has come over the scene in regard to this article of consumption, and what strides it is making in public favour. Although great quantities have been accumulating during the holidays and the catalogues were therefore exceptionally heavy, all grades were actively competed for and substantial advances were recorded in all departments. Grenada sorts showed the full effect of the improved position, prices being 8s to 12s per cwt. above the value ruling at the last auctions in the old year, and while everything was cleared, the market closed strong. Our contemporary goes on to remark:—

Never were the uses of bold advertisement better exemplified. That cocoa is an article of diet of great value has been known to the faculty for many years. But the heavy character of the usual decoction kept it back for years, and when the essences and powders appeared, though they made a certain headway, they were unable to dive straight to the stomachs of the people as tea has done. But of late there has come a remarkable change. Manufacturers everywhere have been waking up to the fact that merit alone cannot get an article into consumption. It needs an adventitious aid. As our readers know cocoa has found it. One can see it everywhere. Grocers can testify to the increased demand, especially for certain brands, and the public are realising, now that it is being borne home to them, that—whatever the merits of rival cocoas may be—the genuine article, in any and every form, is of great value to them in their ordinary dietary. Manufacturers may now be said to be fully employed in meeting the demand which has sprung up in response to the liberal appeals in the press of late. And we can at the more rejoice this and wish for its continuance when we reflect that it is unlikely to disturb the balance of trade in cognate goods, being in large measure, merely in addition thereto.

CURRENCY, DEAR MONEY, FINANCE AND TRADE IN INDIA.

A LEADING CALCUTTA MERCHANT SPEAKS OUT TO SOME PURPOSE :—

“INDIA'S GREAT CURRENCY PROBLEM CAN BE
SOLVED BY OUR FIELDS AND BY HER
LOOMS AND BY THEM ALONE.”

We have seldom if ever read a more convincing address on the Currency and Financial problems which for five years have disturbed India and Ceylon, than that afforded by Mr. David Yule,—a leading Calcutta merchant,—as Chairman of the half-yearly meeting of the Bank of Calcutta, Limited, on the 29th ult. It has reached our hands in pamphlet form and we cannot refrain, great as is the demand it makes on our space from giving it in full, so special must be its interest to every planter, nay every producer, merchant, banker, and trader in Ceylon. “Them's my sentiments” may well be the response to nearly every division of Mr. Yule's address and the marvel is with such convincing evidence of the evil inflicted on the opposite Continent—its agricultural millions, its manufacturing and industrial sections, bankers and traders, that no definite action by a Public League has been taken long ago to counteract the utterly foolish policy of the Government financiers.

We can assure Mr. Yule that all Ceylon is ready to back him, and to form a League tomorrow to secure a return to the sound automatic working of Exchange which prevailed previous to 1893, a condition which very lately Mr. Henry Dunning MacLeod—acknowledged to be one of the highest living authorities on Currency, Banking and Finance—pronounced to be a perfectly safe and sound one for a country situated as India was. We can fancy how readily Mr. Bethune (whose recent speech will be found on our sixth page), Mr. Joseph Fraser and other leading Ceylon planters as well as the Hon. W. W. Mitchell representing our solitary Spinning and Weaving Mill, will endorse what is said.

CEYLON TEA IN RUSSIA.

Mr. T. N. Christie has just received a cutting of an advertisement which has been appearing recently in all the Moscow papers, and sends it to us together with a translation as being of interest to our readers. The translation is as follows :—

CHINA-CEYLON TEA.

There has of late been a great increase, which still continues to grow, in the use of a tea consisting of a mixture of China tea with that of Ceylon and others, without a single firm selling such mixture making any mention of that fact on its labels. Thus the consumer is quite ignorant whether he is drinking China tea, Ceylon tea, or a mixture of the two.

The Company has hitherto had and will always continue to have on sale separately both pure China tea and pure Ceylon tea. Yielding, however, to the demands of buyers, the Directors have arranged for the sale of a tea consisting of a mixture of China tea with Ceylon tea, but in order not to anyway lead astray the public as the tea they are using, have decided to call the new issue of tea by its proper name: “China-Ceylon tea,” which name is printed on the labels.

Bros. K. & N. POPOFF.

We are extremely pleased to see this important Russian Tea House taking so much interest in Ceylon teas, and arranging to sell our teas pure as well as in blend.

YOUNG CEYLON IN BRITISH EAST AFRICA.

The following letter received from Mr. A. P. Wijeykoon, one of the medical men who proceeded to Uganda in December last, will be useful to others who intend to follow in their wake, says our legal contemporary :—

“We reached Klindini on the 5th instant and reported ourselves to the Chief Engineer, who referred us to the P. M. O. Dr. Carie, whose instructions were that we were to remain here till we learn the Hindustani language. I am House Physician, Oorloff House Surgeon, and De Jong is in charge of the oxygen treatment for Ulcers, &c., which was introduced after our arrival. After we pick up a little Hindustani, two of us will be sent upcountry to attend to the men there. The Department seems to be very short-handed and I expect that they will indent for some more men. The place does not seem to be so bad as we were led to believe. It abounds in fruits, such as bananas, coconuts, jak, mangoes, cajunuts, papaya, &c. The water supposed to be drunk is condensed water from the sea, but most of the people use well water. In addition to our pay we get our diet which consists of rice, dhall, curry stuffs, ghee and flour, &c., also two lb. of ice a day for each man.”

COFFEE, COCONUTS AND CULTIVATION GENERALLY IN BORNEO.—In an official Report for 1897 on North Borneo, we read :—

Some gentlemen in Ceylon formed a Syndicate to cultivate coconuts in Borneo and Mr. A. E. Wright and a Sinhalese expert arrived here during the year and reported well on the soil.

And later on, we have the following record :—

Cultivation.—In general terms the Territory has progressed during the past year despite the fact that one tobacco estate has closed, with as yet no fresh opening, and that one or two products have given less satisfactory results than were hoped. Tobacco.—The prices as yet realized have been quite up to expectation. Bilit Estate was finally closed early in the year, but search has been made for suitable new land both on this and the West Coasts. A restricted area has been selected at Tawao, but home companies require much greater room, and it is believed that the early part of 1898 will see new land opened in Province Dent. Coffee.—The fall of home prices has had an effect on local enterprise in this direction, and it is generally felt that other products must be relied upon if money is to be made. The various gardens are however looking well and a fortunate turn in the market may restore it to former favour. Gambier.—This is flourishing and still maintains its price. Coconuts.—These seem to offer one of the best chances of making profit open to residents. The demand for coir, oil, copra, &c., is rather growing than decreasing, and the only drawback is the length of time which has to elapse between planting and gathering the nuts. Hemp.—This is being grown successfully at Suan Lambah, the only drawback being the want of cheap labour, and it is generally admitted that machinery must be used to secure profitable results. The next few months will determine the question. Rhea.—This is also being planted extensively and offers a better chance of good results, the price being higher than of hemp. But here again machinery is necessary and the remarks above made apply to this product also. Pepper.—This is grown only on a small scale by Chinese and does not figure largely as an export.

THE CACAO DISEASE.

A RECORD OF ITS RAVAGES.

There is abroad some sore feeling in regard to the cacao disease: those whose places have been spared inclining to "cut up rough," and would have no mention made of it, for fear cacao property should be depreciated. But it is a thousand pities that the "hue and cry" had not been started earlier. Much money might have been saved, and by this time we might have been well on the road to successfully combating the pest. As it is, the inquiry is just beginning; and although we hear now and again that one local scientist is on the track of the enemy, has marked him down, and will be his death ere long; yet it is but the wish being the father of the thought—the thing is only in the air. Mr. Carruthers has not himself spoken and while he is silent, things pretty much remain as they were. We have no wish whatever to exaggerate the extent of the harm done, not the strenuous efforts which must yet be put forth to stamp the pest out; for it goes without saying that in a land like this—the very paradise of insect and fungoid life—it will not be exactly a "walk over" which the cacao planters will have. Nevertheless, if there be hope, the men who grow cacao will undoubtedly be ready to grapple with the enemy, and have a sturdy wrestle for the mastery.

Up to this time, so far as we know, facts and figures as to the extent of the harm done, have not been forthcoming. Those who minimise the evil, speak of a tree here and there dying out, jauntily refer to it as a thing to be expected, common in all kinds of cultivation; and trace the cause to 'wet feet,' improper conditions of the soil, or *anything* in fact. It ought never to have been referred to at all, they say, and especially in the public prints. Those who have been and still are "under the harrow" have already enough to put up with, and do not particularly see what the public have to do with their bothers and losses. It is hard enough to bear them without being made an object-lesson for an agricultural community. All this is natural enough, and we are inclined to sympathise with both classes. Happily there is a third class, who, with the view to emphasise the need of action, are neither so sensitive nor reticent as the others, and we are today able to give the cacao crop, gathered from 110 acres, for the last six years. The planter who has obliged us with these figures does not desire that the name of the property should be known, nor that his own name should appear, but we know of what we write, and can vouch for the correctness of the figures. The crops run as follows:—

	cwt. qr. lb.		cwt. qr. lb.
1892	.. 318 2 1	1895	.. 317 1 25
1893	.. 432 0 17	1896	.. 329 1 25
1894	.. 394 3 3	1897	.. 193 2 12

The disease first appeared on the estate at the end of 1894, but not until last year did it become very bad. The figures given are eloquent enough, and perhaps those planters who are inclined to charge us with the sinister motive of depreciating cacao property, exaggerating the evil, and such like nonsense, will now be convinced, that there is a constituency in Ceylon who feel that the publicity which has been afforded to this serious matter was certainly called for. The existence of the evil was smothered too much at the outset, and now it would seem as if the day of reckoning had fully come.

At present the Planters' Association is issuing a circular to all cacao growers, asking for support toward remuneration of the scientific services of Mr. Carruthers, whose aim, as we all know, is to find out a cure for the cacao disease. That this appeal will be well supported we doubt not, and the sum needed is not a big one. If the ravages of the cacao disease are to mean in all gardens where it appears, anything like what it has cost the proprietors of the estate whose returns we have been permitted to quote, then we need offer no word to press upon cacao-growers, to support the call now made upon them. Self-interest alone will be reason enough to open their purse-strings, not to speak of anything more public-spirited. Now that the needed Cryptogamist is in the Colony, and that the field for his investigations is clearly defined and wide enough in all conscience, Mr. Carruthers' valuable services should certainly be retained until our Cacao planters feel that the Scientist has his hand on the throat of their enemy, and that its destruction and expulsion are in a fair way to be compassed.

RICE FROM SOUTHERN INDIA.

THE RECENT VISIT OF ENQUIRY BY CEYLON PLANTERS.

Report of a deputation, which visited the principal centres of S. Indian rice trade—viz., Negapatam, Tanjore, Shiyali, and Cuddalore—all of which are included in the special reduced through-booking scheme of the S. I. Railway.

NEGAPATAM.—This place was visited on the 23rd of January 1898. It is the centre of the *sea-borne rice* trade of S. India, although comparatively little rice is grown in the immediate neighbourhood. The evidence taken at this place was, therefore, exclusively that of shipping; chetties and their brokers and not of cultivators. The distance from Negapatam to Tuticorin by rail is 265½ miles; to Colombo about 415½ miles via Tuticorin; from Negapatam by sea direct (via Paumben) to Colombo is 260 miles more or less. It is, therefore, eminently satisfactory to have elicited from these people the opinion that in the North-East monsoon (at least) transit by rail to Tuticorin, and thence by sea to Colombo is preferable to direct shipment from Negapatam to Colombo.

The Nagapatam dealers expressed their willingness to send periodical samples and quotations with a view to direct dealing on the lines laid down by the deputation, which will be referred to later.

TANJORE.—Visited January 24th, 1898. Distance from Tuticorin 217½ miles by rail. Tanjore is the principal rice-growing district. It has a permanent irrigation system from the river Cauvery, and quotations from this district should be less liable to fluctuations than less favoured districts. The persons interviewed here were not owners of land or cultivators, but were buyers of paddy, who employ labourers to convert the paddy into rice, which they afterwards vend.

SIRIMANE AND SEMBALA.—They produced samples of two grades of rice, which are locally known as Sirimane and Sembala, which are known to us as Mootoo-Samba and Kalunda.

For these they quoted free on rail in double gunnies.

Mootoo-Samba	R7.06 per bag of 190 lb. gross.
Kalunda	R6.51
"	"
"	"
"	"

The samples shown were certainly superior to the rice of similar grades sold in Ceylon, and distinctly cheaper, say, R3.13 per bushel in Colombo for Kalunda, including all commissions and agency charges.

After this interview with the dealers the deputation was approached by four rice cultivators (land-owners) who wished their address registered with a view to direct dealing with our Agent.

CUDDALORE.—Visited January 25th. Distance from Tuticorin 316 miles. Only one cultivator was interviewed, but this place (the most distant of the tour) has produced two firm offers of rice in large quantities—but of qualities not suitable for Ceylon requirements.

SHIYALI.—Visited January 25th. Distance 281½ miles from Tuticorin. This was the most largely-attended meeting of the tour. The persons interviewed included both merchants brokers and proprietors-cultivator. The deputation found that business had been carried on direct between Shiyali and Colombo for some time, through Agents in Tuticorin and Colombo, and are of opinion that it will be easy to arrange direct dealings with this place although rates quoted on the spot were somewhat in excess of Tanjore figures.

The deputation were particularly struck with the enormous acreage under rice between Cuddalore and Tanjore, and its healthy appearance though no rain had fallen for some months owing to the failure of North-East monsoon.

CONCLUSIONS AND RECOMMENDATIONS.

1. That the through booking of rice should be strongly recommended to the notice of the Planting and Mercantile communities as profitable to both.

2. That not more than two persons (acquainted with the rice business) go to Southern India about March 1st or thereabouts—if possible in company with a future South Indian Buying Agent.

3. That they purchase rice in various places at the best rates then obtainable—guided by the average Colombo quotations for South Indian rice.

4. Meanwhile arrangements should be made for the appointment of 1st. An agent (European on the Coast.) 2nd. A distributing house in Colombo.

Note.—Without these, direct business between planter and rice-grower would probably prove unsatisfactory, in view of the universal desires of these interviewed for an agent, with whom they could deal directly, and who would be responsible for the conditions of payment, and for the quality of rice purchased by him at the centre of supply.

The distributing-house would have to split up consignments of rice, which would often be too large for individual consumers, (one truck load of 72 bags or say 200 bushels being the smallest quantity accepted at through booking rates.) It would also check quality and weight in the interest of the consumer, and make general arrangements for financing consignments.

Note.—It must be borne in mind that the concession (nominally a reduction in freight of 12 cents per ton) made by the Ceylon Government Railway is of no practical use whatever, and that it is a concession at all is not borne out by actual figures before the deputation. On the contrary the Ceylon Government Railway appears to have (while granting an apparent concession) quoted to the South Indian Railway slightly more than rates actually levied by the Ceylon Government Railway. There is therefore no objection to booking through only as far as

Colombo, where trustworthy agents could deal with the rice to their own profit and the convenience of customers.

6. The deputation therefore recommend that planters co-operate in supporting a Central Agency in Colombo with an agent on the coast, and consider that this agency could profitably do business at 2½ per cent. commission to approved constituents on the ordinary terms of local business.

CONDITIONS OF PURCHASE, AGENCY, &C., as suggested by the deputation and generally approved of by dealers, cultivators, agents, and others interviewed.

1. The unit of purchase to be by weight, viz: the bag of 190 lb. gross in double gunnies—*i.e.*, about 186 lb. nett rice.

Note.—The mean weight of new rice appears to be 62.656 lb. per bushel, and of old rice 65.728 lb.

2. No advances or forward contracts to be made except by special agreement.

3. All prices to be quoted free on rail, bags and all petty charges included.

4. Payment to be made by drafts at 14 days after sight (negotiable at the nearest bank or agency to the place of purchase) on production of the South Indian Railway receipts.

5. Rice to be at buyer's risk against loss in weight or sea* damage from date of delivery on rail.

6. Commission to be at 12½ cents per bag for agent in South India,

Memo.—It is evident that the Distributing Agency (to avoid loss on individual consignments) would have to charge a covering rate, and the deputation recommend that such profit be divided 50 per cent to go to the constituents of the agency—*pro rata* to their individual purchases of rice, and 25 per cent each to the Colombo and South Indian Agents.

In conclusion the deputation wish to put on record their hearty thanks to Captain Shelly and many other officials of the South Indian Railway for their assistance in facilitating the collection of evidence, to the Colombo Agents of the B.I.S.N. Company, and to the various gentlemen who helped the deputation with their advice and information.

NOTE.

The addresses of cultivators, merchants, brokers, South Indian firms, and individuals willing to do business on the lines indicated by the deputation, may be obtained on application to the Secretary, Ceylon Planters' Association, who has been furnished with a verbatim report of the evidence collected on the spot.

(Signed) A. MANSFIELD FORBES, PHILIP F. RYAN, GEO. C. BLISS, A. M. CARMICHAEL, JAMES RYAN.

[Appended to the report is the circular regarding the through booking of rice, with useful hints and full details as to charges.]

THE CULTURE OF VANILLA IN WEST AFRICA. The experiments in vanilla culture in the German colonies of West Africa have, so far, been successful, and the plants appear to be becoming acclimatised. It is believed that these colonies will furnish as good vanilla as that from Reunion. The most important plantation is that of the Catholic mission of Bagamoyo.—*Apotheker Zeitung.*

* Cost of insurance by Messrs. Adamson, McTaggart, & Co is R2 per 6 ton waggon load or about 1 cent per bushel.

CINCHONA BARK: ITS "CONTROL" AND PROSPECTS.

Our friend, Mr. G. Mundt of Java, has been doing good work for the Cinchona planters, while in Holland and has at last succeeded apparently in securing such a union of cultivators and importers as may defy the alleged German combination of manufacturers of the alkaloid. In Amsterdam there is a Committee or Council of the Association for Promoting the Interests of Cinchona Culture, which lately called two meetings of the importers of Cinchona Bark. At one of these, Mr. Mundt, who is a very powerful personality amongst Java bark growers and importers, gave those present at the meeting such strong encouragement and assurance of support from Java that hesitation was at once put aside and specific clauses of agreement drawn up. The meeting agreed,—

1. A committee of five, representing consignees and planters, to be entrusted with the direction of the operations.
2. No cinchona to be offered except at auction.
3. The quantity to be so offered to be limited to the requirements as estimated by the committee, if necessary, after consultation with the importers, and to be taken proportionately from the supplies declared available for sale by the importers, twenty-five days before the auction day; no lot to be split.
4. If necessary, a minimum limit to be fixed before each auction by the committee in consultation with the importers.

The following were elected members of the executive committee:—

J. A. C. van Leenwen, F. L. S. van Heekeren, W. J. P. van den Bosch, G. Mundt, and Patrice Cramer.

The committee, in issuing the report of the proceedings mentioned above, appeal for the assistance of all interested in the cinchona trade of Java. Mr. Mundt will shortly return to that island, and endeavour to further the interests of the new cinchona combination there.

In framing these resolutions the manufacturers of quinine have not been lost sight of, but it is somewhat sanguinely expected—says the *British and Colonial Druggist*—"that the German combination will not oppose the action of the bark sellers. In support of this it was said that one of the manufacturers of quinine had declared that the latter would far sooner not have taken the steps which had resulted in injury to the proprietors of cinchona plantations, and that they would not regret an understanding being arrived at amongst such proprietors. It is probable that the manufacturer who uttered these sentences was quite sincere, but speaking at a time when such a combination of importers and planters appeared impossible, he would be in a far different frame of mind from that with which he would regard a strong and united ring amongst the sellers of the crude material with which he worked. Anyhow, we shall soon have the opportunity of seeing how this gentleman and other quinine manufacturers regard the new departure. Everyone interested in the quinine and bark markets will follow closely the next three auctions in Amsterdam, which are in the nature of an experiment to decide forthcoming plans. When those have passed, we, like the importers, shall be able to speak more confidently as to the future."

From the report of the Amsterdam meeting we quote some interesting passages:—

A good many cinchona planters imagine that the erection of quinine factories in Java has gained their point for them; the future, however, will in all probability show that these planters are mistaken. Much,

very much is gained by the erection of those factories; but most certainly not everything, especially as regards the immediate future.

In order permanently to relieve the cinchona market it is necessary that proprietors of cinchona undertakings, should place the fullest confidence in the judgment of their importers and that such proprietors should leave their importers perfectly free to deal with the stocks of cinchona bark as the importers think best. When importers have a free hand and will employ the latitude allowed them in a proper manner—and we cannot think that importers will act otherwise than properly—then it stands to reason that the importers and not the ring of German manufacturers will hold the reins in the matter. The result of this will be that the quantities of bark to be put up to auction will be judiciously determined, and that the unit will be fixed in such a way as to allow the proprietors of the cinchona undertakings to obtain a return for the sold portion of their produce, not only appreciably larger than during the last few years they obtained for their entire harvest, but amply sufficient to cover all expenses besides, and to leave a good margin of profit in addition. Besides which, the difficulty of the first-hand stock of cinchona bark becoming too large in consequence of the whole supply not being sold will vanish of itself; for assuredly the proprietors of undertakings will not be so foolish as to incur expense in gathering and shipping bark which they know will be warehoused for an indefinite period by their importers.

To produce a healthy condition, importers, once they have acquired the free disposition of the cinchona bark—at any rate during a series of auctions—will, probably, put coalition against coalition, at least have to fight, if only to convince the manufacturers that there can no longer be any question of dissension. But such a course will not prove necessary in the long run, provided importers be left a free hand. At any rate, while the injurious results of the position hitherto taken up by the proprietors of the cinchona undertakings will, on the one hand, gradually vanish, and the market be placed upon a sound footing, the Javanese quinine factories will, on the other hand, exercise a more and more wholesome influence upon our market, since those factories will be in a position to fight the manufacturers on their own ground if need be.

It may be mentioned that Mr. Massnik, one of the two Java quinine-makers, has written a letter to a local paper in which he states that the *modus operandi* of the European quinine-ring, consisting of four German makers and the firm of Howards & Sons, is as follows:—The members of the ring have placed the control of their sales of quinine in the hands of the *Gold- und Silber-Scheide Anstalt* of Frankfurt-on-Maine, or rather of Mr. Andreae, the director of that powerful chemical-factory. Mr. Andreae fixes the quantity of quinine which each factory may sell, and its selling-price. He signs all the quinine invoices of the five makers, and he determines in what markets each shall sell. The five makers may buy bark and at any price they like, but they always must buy back and as much quinine in the bark as they have sold of the manufactured article. They may buy more if they choose, but not less. It is not certain whether these conditions relating to bark-purchases are still in force.

We also understand that the Bandoeng (Java) quinine-works have made a contract to supply a fairly large parcel of quinine direct to Australia at the price of 1s 0½d per oz, "c.i.f." terms. It is stated that the world's total output of quinine in the bark amounts to 300,000 kilos., of which Java alone produces 250,000 kilos. four-fifths thereof being yielded by one province of Western Java alone. The planters in that province propose to form an association for the protection of their industry, and to issue a periodical to the members giving the fullest possible information on the subject.

Mr. H. A. van Overzee, of Amsterdam, sends us his annual review of the Amsterdam cinchona-market for 1897. He considers that, while the power of the combined German manufacturers has not been suffi-

cient to prevent an advance in the bark-price, owing to the increased consumption of quinine, yet their strength is by no means broken. The existing supply of cinchona is not excessive, but if the Java planters harvest and ship recklessly this year the advantage in price gained in 1897 will be lost soon. The results of the quinine manufacture in Java have been but slight up to the present. He considers that the Java planters alone have it in their power to regulate the price of quinine in the future, provided they can make a working-arrangement among themselves.

PRODUCE AND PLANING.

RAMIE CULTIVATION IN AUSTRALIA.—It is suggested that the rhea, or ramie, plant should be grown in Australia, where there is reason to believe that it will flourish, as it grows well in the Botanical Gardens at Melbourne and in nurseries elsewhere. Until recently the labour involved in separating the fibre from its gummy covering was so great that the crop could be grown commercially only where labour was very cheap, in Eastern countries. But the invention of a labour-saving process in 1895 brought the production and manufacture of rhea within the reach of other parts of the world suitable to its cultivating and bark-stripping, after a plantation has once been made, at £4 an acre, and the value of the bark at £10; but, of course, both expenses and returns must vary in different parts of the world.

TRAINING FOR BOTANICAL CURATORS.—The gardeners of Kew have a journal of their own, or, rather, of the guild they formed some years ago. A list of the names and addresses of members shows that no less than fifty-three old Kewites hold positions in India and the Colonies, whilst all the curators of Botanic Gardens in the United Kingdom were trained in the Royal Gardens. The limit of service for journeyman-gardeners is two years, but those who are promoted to sub-foremen stay on until they obtain appointments either in colonies and dependencies, or at home. Courses of lectures are provided after working hours on systematic, economic, and geographical botany, chemistry and physics, and certificates are granted.—*H. & C. Mail*, Jan. 28.

THE EFFECT OF EXCHANGE RATES ON INDIAN AND CEYLON TEA PRODUCTION—WHAT INDIA HAS BEEN SAVED FROM.

[To the Editor of *The Home and Colonial Mail*.]

SIR,—Sir James Westland is credited with stating that he has saved India from a fall in the rupee to an exchange value of 9d. Where is the saving? Is there a saving? Who makes the saving?

Had not the Indian Government taken to tinkering with the currency and maintaining the exchange value of the rupee at a fictitious level, as compared with its intrinsic worth it is probable that the proprietors of tea estates in India and Ceylon during the year 1897 would have reaped in profit some £2,000,000 more than they are likely to do.

The total imports of Indian and Ceylon teas into the United Kingdom during the calendar year of 1897 were 228,000,000 lb, and the average price realised for same in London public auctions was roughly 8½d per pound. It is improbable that, taken over all, the profit on production exceeded 2d per lb, and, allowing another penny per pound for freight and charges not subject to exchange, we get 5½d per lb as the average local cost of production at the ports of shipment—Calcutta and Colombo. This cost has to be remitted in some manner or other to India or Ceylon, and, on a yield of 228,000,000 lb, we get £3,225,000 as the crop outlay for the year.

Taking the average rate of exchange for 1897 as 1s 3¼d, and deducting from same the 9d admitted by Sir James Westland to be the present real value of the rupee, we have 6½d per rupee loss, or an aggregate loss

during the year, of £2,190,000 to the tea industry from exchange alone. Roughly speaking, therefore, every penny up or down in exchange quotations means £340,000 less or more in net revenue from British-grown tea. The calculations have not been worked out to a nicety because the complete date of working them do not exist, but the result shown cannot be far from an actual one. Anyhow, it affords grounds for "pointing a moral" against the maintenance on merely sentimental grounds of a fictitious level of value for the rupee, and the statement of such serious considerations may awaken the large body of proprietors and shareholders in Eastern tea estates to a realisation of the grave injustice that is being done to their interests. They have hitherto accepted the position in the belief that the upward movement in exchange was merely a spasm, and that we should probably soon see rates lower than ever; but the position must now be becoming serious for many proprietors, owing to the constantly falling prices on the one hand and the rising exchange on the other. The full force of both considerations has not yet been felt, but, as the accounts and reports for 1897 begin to be issued in a month or two, the effect is certain to be clearly shown in the rates of dividend, unless in the case of properties worked under exceptional circumstances.

There is no question but that the tea-producing industry, greatly benefited by the more or less continuous fall in the exchange value of the rupee from its per level, and that consequently much new capital (in the way both of reorganisation of old concerns with a new proprietary at enhanced values, and in direct opening up of new properties) has been put into the business in the last few years. Many of such investments were made on calculations which had for their basis the understanding that a rupee did, as the China dollar does, represent its silver value; but the financial advisers of the Government of India have given a rude shock to those who have placed their trust in that idea.

The amount of capital invested in tea estates in India and Ceylon is somewhere near £40,000,000, and it will be apparent that those who hold the investments are being taxed to maintain a high rate of exchange to the extent of something like 5 per cent. per annum on the capital value of their holdings.—I am, sir, yours, &c. JOHN MCEWAN.

NEW MINOR PRODUCT FOR CEYLON : THE CAMPHOR TREE.

"It is reported that three well-known citizens of Orlando, Florida are going to plant about 60 acres with camphor trees." So runs a paragraph in an English journal; but why should it not be one, two or three planters in Ceylon? If the camphor tree is expected to flourish in Florida, much more should it succeed in Ceylon and we know something of the conditions on both countries. Undoubtedly there has been a stir in the camphor trade lately; and between the 25th December and 15th January there was a rise in the price of crude camphor in the English market of from 4s to 8s 6d per cwt. But this may be a temporary movement due to interference on the part of the Japanese with the Formosan camphor trade. This is likely to be rectified, since we read that,—

The Japanese are now showing, that while they are determined to get a good grip of the Formosan camphor-trade, they are to gang warily about it, and those who know the Japanese agree that when they have the Formosan trade in their own hands, they will conserve rather than restrict the output of camphor, and by introducing their own method of distilling, they will get more out of the wood and put a better quality of crude Formosan camphor on the market. It will be remembered that the exports of camphor from Formosa have increased enormously during the past ten years. In 1886 the output was

1,335 piculs, and in 1894 no less than 39,547 piculs were exported. Some falling-off resulted in consequence of the war and the Formosan rebellion in 1896 but we observe that the Tainan export in 1896 amounted to 8,007 cwt., or 641 cwt. above the average for 1891-94, so that improvement had set in; and we may fairly say that the same holds good for the northern territory, which produces a much larger proportion of camphor. The London importations of camphor in 1897 confirm this view, 1,050 packages (approximately 1,837 cwt.) more being received than in 1896, but there is still a good leeway to make up before we reach the figures obtaining before the war, as the following shows:—

	1894	1895	1896	1897
Imports ...	11,081	19,711	6,473	7,523 packages
Deliveries..	11,663	7,923	10,814	8,017 "

These figures represent Japanese and Chinese camphor. It is obvious that the imports at the present time are less than the demand, and we have during the past two years drawn upon the reserve stock held in London (fully a year's supply). In view of these facts refiners' reduction of price is an indication of their confidence in the future of the article. The Tainan Consul supplies an excellent corollary to this in his statement of the cost of crude camphor in first-hands at Formosa. It will be seen that the lowest cost was \$13 per picul, or about 33s 6d per cwt., taking the dollar value at 2s 6d. The product doubled in value (\$37 per picul) by the time it reached Hongkong, and the simultaneous price in London was 87s 6d cwt. As the market stands now, we have again reached the minimum, and while an increase is to be expected during the year, we do not think that the extravagant prices of the past few years can rule in the face of an improving supply and the disaster which attended speculation in recent years.

There is encouragement in all this, to cultivate and as we said above, Ceylon planters might well give a trial:—

Cultivation.—The plant should succeed in most parts of the island. It may be propagated from cuttings or raised from seed in a bed set apart for the purpose. When ready for planting out, plant in rows 8 feet apart, giving a space of 4 or 5 feet between each plant.

Preparation.—In a letter to the Royal Gardens, Kew, Dr. A. Henry gives the following description, obtained from the Rev. E. Y. Gilman, of the process employed by the Chinese in extracting the camphor from the plant in the Island of Hainan:—The plant is in flower in July and August. During the fall and winter months the Chinese of the island, or the aboriginal Loïs in Chinese employ, collect the young leaves of the plant, which there grows to a height of 8 or 10 feet. They say they only take the last three joints of the branch. The leaves are allowed to remain on the branch, and are wilted for a couple of days. They are then placed in the retort, which is a cask about 2 feet high, open at both ends, and of a diameter suitable to place it over a large Chinese frying-pan (say the diameter is 20 inches). The frying-pan is filled with water, and over the water is placed a coarse sieve of woven bamboo to separate the leaves from the water. The cask is cemented with clay to the edge of the pan, and after receiving its charge of 30 lb. or 40 lb. of the leaves, a large brass basin is placed on the upper open end of the cask, and is filled with cold water which is frequently changed. Fire is placed under the frying pan, and the process of distillation is continued for about four hours. At the end of that time the brass pan is lifted off, and its lower surface is found to be coated with a layer of crystallised substance about sixteenth of an inch thick. This is the *ai fen* or crude camphor, and is sent to Canton, and remanufactured into *ai-pien* or refined camphor.

Another writer gives the following as the process of preparation:—(1) A large pan or cauldron is filled with water, and a tin or can without a lid is set upright in it. This tin has a small aperture beneath, into which is fitted a metal tube. The plant is put into the tin, and a second iron pan put over the tin

like a cap. This pan has an aperture through which issues the tube leading from the can. The water is made to boil, and the steam, having no other means of egress but the tube, passes through the can and out of the covering iron pan, steaming the plant on its way, and condensing as "*ai dew*." (2) In the second place, the "*ai dew*" is put into a tin or can which has no orifice in it, and, with that variation, treated as before. The product is called *ai fen* (or "*ai flour*" or "*powder*"). (3) The "*ai powder*" is treated according to the first of the three processes, and the essence thus distilled is the fragrant *ai yu* or "*ai oil*."

Notwithstanding the comparatively narrow limits of its natural environment, the camphor tree grows well in cultivation under widely different conditions. It has become abundantly naturalised in Madagascar. It flourishes at Buenos Ayres. It thrives in Egypt, in the Canary Islands, in South Eastern France, and in the San Joaquin valley in California, where the summers are hot and dry. Large trees at least two hundred years old are growing in the temple courts at Tokyo, where they are subject to a winter of seventy to eighty nights of frost, with an occasional minimum temperature as low as 12° to 16° F. The conditions for really successful cultivation appear to be a minimum winter temperature not below 20° F., 50 inches or more of rain during the warm growing season, and abundance of plant food rich in nitrogen. In the native forests in Formosa, Fukien, and Japan, camphor is distilled almost exclusively from the wood of trunks, roots, and larger branches.

The work is performed by hand labour, and the methods employed seem rather crude. The camphor trees are felled and the trunk, larger limbs, and sometimes the roots, are cut into chips which are placed in a wooden tub about 40 inches high and 2) inches in diameter at the base, tapering towards the top like an old-fashioned churn. The tub has a tight fitting cover which may be removed to put in the chips. A bamboo tube extends from near the top of the tub into the condenser. This consists of two wooden tubs of different sizes, the larger one right side up, kept about two-thirds full of water from a continuous stream which runs out of a hold in one side. The smaller one is inserted with its edges below the water, forming an air-tight chamber. This air chamber is kept cool by the water falling on the top and running down over the sides. The upper part of the air chamber is sometimes filled with clean rice straw, on which the camphor crystallises, while oil drips down and collects on the surface of the water. In some cases the camphor and oil allowed to collect together on the surface of the water and are afterwards separated by filtration through rice straw or by pressure. About twelve hours are required for distilling a tubful by this method. Then the chips are removed and dried for use in the furnace, and a new charge is put in. At the same time the camphor and oil are removed from the condenser. By this method 20 to 40 pounds of chips are required for one pound of crude camphor.

Remembering that some years ago, Mr. Nock of Hakgala advocated the planting of camphor, we enquired as to what had been done so far as he knew. Here is his very satisfactory answer:— "With reference to your question about camphor, I may state that during the year 1895 we sent out from the garden 975 plants to 37 applicants. These were planted in a great variety of elevations and climates and I believe they are doing well in nearly every place. Some that were planted near Galle had grown in two years to a height of 12 feet, others at Nuwara Eliya have grown to nearly that height, and some here at Hakgala are now over 9 feet high. This growth is very satisfactory. The plants coppice well and as solid camphor can now be extracted from the leaves, camphor is a plant, in my opinion well-worth planting as a minor product. It is also a very ornamental tree. Not having had an oppor-

tunity of seeing the plants growing in the different localities, in the lowcountry (I wish I had) I am really not able to state, with any certainty, what locality will be likely to suit them best, but so far as I can judge at present they seem to be not at all particular, provided they have fairly good soil. Of course elevation, and a dry or wet climate may affect the yield of camphor oil and solid camphor. This can only be determined by actual experiment."

IMMIGRANT COOLY ROUTES.

THE PROPOSED DEPOT: HARE ISLAND VS. TATAPARAI.

THE SUB-COMMITTEE'S REPORT TO THE P. A. COOLY ROUTES: TUTICORIN-COLOMBO.

At the present time the coolies find their way to Tuticorin by rail from the various stations on the South Indian Railway, and remain in that town for generally a day or so before embarking for Colombo. The place of embarkation is the jetty, which juts out from the open space along the sea-front of the town, and up to which a line of rails is carried connecting with the railway, so that trains can be brought straight up to the jetty. The usual hour of embarkation is about 4 o'clock p.m., and passengers are taken out to the ship in a steam launch, a distance of about five miles. Coolies staying at Tuticorin are subjected to risk of blackmailing as well as infection of cholera and other diseases. It therefore becomes necessary to organize some plan by which the coolies need not or cannot go into the town at all. Two places have been suggested, viz., a depot either at Hare Island or at Tataparai.

Hare Island lies on the course of the steam launches running between the steamers and the jetty, and is about one-hundred and twelve acres in extent. The Tuticorin light-house is situated on the island, which is otherwise uninhabited. Tataparai is the first Railway Station from Tuticorin on the S. I. Railway, and is about nine and half miles from that town. In considering the advantages and disadvantages of the two schemes, the points calling for attention are:—

1. The expense.
2. The convenience, accessibility and hygiene.
3. The risk of infection.
4. The comfort of the coolies.
5. The attitude of the Government.
6. The possibility of this route becoming less used.
7. The existence of a depot and possible quarantine station at Bagama.
8. The arrangements for remitting funds to coolies in transit.

1. **THE EXPENSE.**—The cost of the scheme at Tataparai is estimated at about R7,000, including all necessary buildings to accommodate, say, 1,000 coolies. It must be understood that it is not proposed to make either place into a quarantine station, but only a stopping place when the coolies can rest and cook their food after the railway journey. The cost of the Hare Island Scheme would have to include a jetty on the island besides quarters for the Immigration Agent, and could hardly amount to less than four or five times the cost of the Tataparai Scheme.

2. **THE CONVENIENCE, ACCESSIBILITY AND HYGIENE.**—If the Tataparai Scheme be carried out, coolies can be booked from stations on the railway to Tataparai and detained there, and can again be booked through from Tataparai to Colombo, or any station on the C. G. Railway.

Kanganies wishing to keep their coolies out of Tuticorin can therefore do so by through booking from Tataparai. Coolies will not be subjected to blackmailing by Tuticorin caddy-keepers or others, as the depot being on premises belonging to the railway, no persons will be admitted unless with the permission of the Agent. No caddies can be erected in the neighbourhood as the railway has a right to prevent any buildings being erected within a radius of half-a-mile from the station, and this right will be exercised.

As regards the Hygiene, the Ceylon Assistant Immigration and Medical Officer, Dr. Bawa, has reported that the soil at Tataparai contains organic matter, and is likely to become sodden and waterlogged during the rains but that by drainage, paving, and conservancy, this objection can be obviated. It appears, however, that the total rainfall for 11 months last year was only 21 inches, and that not more than 5 inches fell in any one month.

As regards Hare Island, in order to get there, the coolies would have to go first to Tuticorin, and would be liable while there to all the disabilities of the present system; unless they had booked through to Colombo or could be induced to go straight off to Hare Island. This they could not be compelled to do, and it would also be impossible to prevent residents of Tuticorin from visiting the Island unless the Madras Government took steps to prohibit any visitors. As regards Hygiene, Hare Island would be a healthy place, and the depot could easily be kept in a sanitary condition by the use of sea water which would be carried by the coolies. Fresh water can be supplied to either depot in any quantities required by means of tanks on the rail or by boat at a nominal cost. Should cholera break out in anything but a sporadic form at either depot, the result would probably be that the depots would have to be closed temporarily. The coolies would not remain at Hare Island if cholera prevailed there, and it is doubtful if the light-keepers even would stay, and as regards Tataparai, it would not be right to receive more coolies into an infected depot. But with efficient supervision it is improbable that any serious outbreak would occur at either place, as each case would be immediately segregated. It should not be forgotten in considering the necessity of an expensive scheme that but little trouble has been experienced hitherto as regards cholera amongst immigrant coolies, and that the immigration of this class by this route has only once been interrupted in recent years.

It has been suggested that in case of interruption of traffic between Tuticorin and Colombo, coolies might still be shipped from Tuticorin to Paumben, and quarantined at the station, and the flow of coolies to the Island thus maintained until the Colombo route was reopened.

3. The risk of infection of immigrants would be much less if either scheme were adopted, than it is at present. At Tataparai the only risk would be from coolies who had the infection on them, and at Hare Island the same remark would apply, provided the coolies could be induced to go there without stopping at Tuticorin on the way.

4. The comfort of the coolies could be equally provided for at both places. As far as buildings are concerned—but in stormy weather the coolies on Hare Island would be exposed to the full force of the wind and spray or drift sand—besides being exposed to the unavoidable discomfort of a double transhipment.

5. The attitude of the Madras Government is unfavourable to the Hare Island Scheme. We are informed on the best authority that that Government have no objection to the Tataparai depot scheme on the lines laid down in Mr. Wilkinson's letter of 1st November, 1897. The coolies being a free immigrant no compulsion of any sort will be permitted, and he must be perfectly free to come and go. It will, therefore be impossible to prevent him from visiting Tuticorin if he chooses, even after he has been conveyed to Hare Island, and also it may be supposed that the Madras Government will not sanction any prohibition of Tuticorin residents visiting the Island. If so, this of itself would almost be enough to condemn the Hare Island Scheme. Whereas by the Tataparai scheme the avoidance altogether of Tuticorin would be likely to work automatically.

6. The possibility of this route becoming less used must be taken into consideration in view of the statement by the Governor of Madras when on tour lately in reply to the address from the Municipal Council of Madura. He said he was convinced of the advisability of the project of a line from Madura to Paumben, and the certainty of its remunerativeness, and the Supreme Government has now recognised the expediency of the line being constructed. It follows that this line will probably be sanctioned in the near future, and the time for completion is estimated by the Railway authorities at about two years after sanction has been received. This line in conjunction with the North Road and the Northern Railway and the steamer service from Paumben to Colombo would undoubtedly divert a large amount of coolie traffic from Tuticorin. Expert opinion has been given that steamers can be laid alongside the jetty at Paumben, and coolies can walk on board, a great advantage over embarkation by launch or lighter. By the Madura-Paumban railway an alternative route will be available in the event of cholera closing the Tuticorin route, and the coolie will have the option of continuing his journey by sea to Colombo, or by the northern land route according to his destination.

6. By these means also should the port at Colombo be temporarily closed, the influx of coolies whether from Tuticorin or Madura could still go on via Paumben and Mannar.

7. THE EXISTENCE OF A DEPOT AND POSSIBLE QUARANTINE STATION AT RAGAMA.—As this station has been established and is now in use, and will not be discontinued so long as the Colombo route is open for coolies, it seems unnecessary to go to the expense of a quarantine station on the Indian side, and it is doubtful whether quarantine could be established on that side or whether such quarantine would be accepted as sufficient on this side. Coolies could not be expected to place themselves voluntarily in a quarantine station at Tuticorin. Neither Tataparai nor Hare Island intended to be a quarantine station, but only depots and resting places. Is it therefore necessary to go to the expense of the Hare Island scheme for a depot merely?

THE ARRANGEMENTS FOR REMITTING FUNDS TO COOLIES IN TRANSIT.—The Sub-Committee consider that owing to the position of Tataparai on the railway and telegraph line, it will be easier for the bankers at Tuticorin to provide banking facilities at that depot than at Hare Island.

In fine the Sub-Committee approve of the Tataparai scheme, and prefer it to the Hare Island scheme, not only on the score of expense,

which (were Tuticorin the only probable and permanently popular route) would not be an insuperable objection, but because on the whole the former scheme seems to meet the necessities of the case by being more likely to accomplish the object in view—which is to promote immigration by preserving the coolie from interference and tampering at Tuticorin, and from risk of infection, whilst at the same time falling in with the views of the Madras Government.

The Sub-Committee hope to report later on upon the Northern route after visiting Paumben—but meanwhile would point out that in their opinion now that the railway has been sanctioned to Anuradhapura, that route should be made as convenient and popular as possible, and at the same time nothing should be done to compel the coolie to use that route or to interfere with his freedom of choice if he prefer the sea route.

The Sub-Committee recommended that an European Assistant Immigration Agent be appointed at Tuticorin to inaugurate the depot, and make arrangements for facilitating money transactions between planter and kangany.

Further as a result of their personal inspection the Sub-Committee make the following recommendations:—

RECOMMENDATIONS.

I. That two K. S.* type steamers with bilge-keels be run.

II. That better bulwarks and shelter be provided for both launches and steamers.

III. That large placards in Tamil be posted at the jetty, coolies depot and railway stations warning coolies not to pay anything more than the actual cost of their ticket, and to report any cases of attempted blackmailing to the Agent on the spot. To facilitate identification the launch boatmen should be numbered.

IV. Inasmuch as the Tataparai scheme is an experiment, the Committee recommend that Government be requested to obtain the consent of the Madras Government to the continuance of the arrangement indicated in paragraph four of the letter dated 26th July, 1897, from the Government of Madras to the Government of Ceylon, (whereby the Collector of Tinnevely has been directed not to make to private parties any further assignments of land on Hare Island) so as to allow an opportunity (if necessary) of reconsidering the Hare Island scheme.

(Signed) J. N. CAMPBELL,

„ JAMES RYAN,

„ A. PHILIP,

Secretary.

A SEPARATE REPORT BY MR. HARCOURT SKRINE.

In dissenting from the views of the three members of Committee who have signed the report, I am aware that my own views of the necessities of the Immigration question go a good deal further than what the Government appears to think necessary, and are perhaps tinged by my recollections of three years spent at Tuticorin during a period when cholera was unusually prevalent, and when I am satisfied that a Tataparai establishment would have had to be abandoned.

I also cannot disconnect from my mind the further question, in which the whole island of Ceylon is interested, of the requirement, ultimately, of some guarantee for the health-bill of the Colombo Port if the Coolie Route is to be

* The K. S. type is similar to the "Katoria."

permanently kept open. It is because a Hare Island Depot will alone serve these objects that support it as against the Tataparai proposal, and seeing, that the success of tea depends on the free supply of cheap labour, cheaply financed, it behoves Planters to consider, when two schemes are presented to the Association,—which of the two will best serve their ends.

As the Committee's Report favours a depot at Tataparai, I propose detailing (1) a working scheme for a Hare Island depot; (2) the difficulties that would have to be overcome to make it practicable.

(3.) The drawbacks, as they appear to me, to the Tataparai scheme.

(4.) To compare the two schemes as regards (a) isolation and crimps; (b) hygiene; (c) outbreak of cholera; (d) closing of the route; (e) Ragama.

(1.) Were it decided to utilise Hare Island as a depot, and sanitary station for immigrant coolies (I purposely avoid the word Quarantine as the application of this can only be arrived at by mutual arrangement between the Governments of India and Ceylon), the system, I would recommend, would be this.

Kanganies taking gang tickets at stations in India would book direct to Hare Island. They should reach the terminus at the Export Jetty on the Tuticorin Beach Road (which is separated from the native town by a line of merchant offices) at about 12 noon. The British India agents, who control the whole of the well-disciplined lighter service, would have the requisite number of sailing boats waiting to receive the coolies at the jetty, and after the usual medical inspection parade, they would at once embark for the Island.

The voyage usually takes half an hour, and is so reliable as regards a favourable breeze in either monsoon that rowing boats are unknown in Tuticorin, and shipping charges to the steamers lying 6 miles out are actually lower than in Colombo, where manual labor at the oar is necessary.

The coolies should arrive at a jetty on Hare Island at 1 p.m., and the same boats should proceed to take on the coolies who had been resting from the previous day to the steamer.

ESTABLISHMENT.—The first requirement would be the erection of a jetty. The Committee who visited the Island were of opinion that a jetty 100 yards in length, might be necessary, and the cost of such a jetty is given by the Southern India Railway Company from their own experience at Negapatam at Rs. 8,000. I am of opinion, however, that if the coral required for building the depot were raised from the sea in this locality a jetty of forty yards long enough for boats to lie up against would be sufficient.

The following buildings would be needed for the depot.

COOLY LINES.—If as at Tataparai, R7,000/00. It is in my opinion probable that the cost of building will be much the same at Hare Island as at Tataparai, as coral can be raised by hand with little effort, and provides material for permanent buildings as well as lime, sand also being available in any quantity for cement. At Tataparai the buildings would be of mud and plaster costing probably as much, and not permanent. Roofing would be same in either case, either iron or cadjan, the latter very inexpensive, and generally more throughout the native town of Tuticorin.

Space could be reserved for agent and banker's houses and gardens; quarters for medical staff and a Police Station.

Labor being cheap, and the material with exception of cement, timber, and roofing free, the whole complete cost of buildings should not exceed R19,200, divided thus:—

Cost of Jetty	R3,200
Houses for Agent, Banker and Police station	9,000
Cooly Lines as per Tataparai estimate	7,000

Total R19,200

In comparing this estimate with the R7,000 allowed by the Committee for Tataparai, it must be remembered that the latter scheme assumes that the Agent and Medical Staff would reside in Tuticorin. Ground rents are high in Tuticorin, a moderate-sized house letting at R10 and R150 per month. In point of expense, therefore, there appears to me to be little to choose between the two schemes.

HARE ISLAND AS A DEPOT.—Coolies on landing at Hare Island would pass on to the lines appointed for them by the medical authorities, where they would feed and rest, have their clothes disinfected, and, probably, on their own account, bathe in the sea, on the following morning they would proceed to the Bank offices to show their cheques and letters, and assuming estates to have opened, and account with the Bank, these would be debited with the necessary disbursements. The coolies having had a good mid-day meal, would proceed at 2 p.m. to the steamer one and half miles off.

2. THE DIFFICULTIES TO BE OVERCOME TO MAKE THE HARE ISLAND SCHEME PRACTICABLE ARE THESE.—(a.) To obtain a lease of the island from the Madras Government. (b.) To get the Madras Government to police it. (c.) To secure Bankers. (d.) Importation of water, food supplies and fuel. (e.) Exposure to weather.

(a.) The Committee were assured by the correspondence of the two Governments placed at their disposal that the Madras Government was wishful to assist Ceylon should it desire to establish a cooly depot on the island, and the sub-Collector assured them that matters were so arranged as to provide for a lease being given of the whole 112 acres with the exception of 7 acres reserved for the light-house.

(b.) The policing of the island would appear to be a natural office of the Madras Government.

(c.) An Indian Bank has already been in correspondence with the sub-Committee on this subject, and the Tuticorin officials appear to think a scheme in every way feasible.

(d.) The cost of water is ascertained to be $\frac{1}{2}$ cent per cooly at $\frac{1}{2}$ gallon a day, if the best imported water is used.

FOOD SUPPLIES.—As until lately rice and curry stuffs were mainly imported into Tuticorin by sea, there should be much difference between the cost of these on the Island and at Tuticorin, and with the cheap boat-hire, the difference, if any, would be immaterial.

(e.) **EXPOSURE TO WEATHER ON THE ISLAND.**—This is an objection that I cannot concur with the Committee in admitting. The force of the S.W. Monsoon is broken at Hare Island just at Tuticorin by the Cape Comorin Mountains, and can at no time be compared to the monsoon burst on the Ceylon coast. Yet cooly lines might be erected, without objection on this score (within 100 yards of the surf line) anywhere between Colombo and Mt. Lavinia.

DRAWBACKS TO TATAPARAI.—(a.) An objection to Hare Island that coolies would not go there, but stay at Tuticorin appears to me to apply equally to Tataparai. No doubt, at first

a few kanganyes might prefer to go to their accustomed hunts, but even these would soon recognise the advantages of the depot. It is an objection that may in my opinion be ignored in each case.

(b.) AS A RESIDENCE FOR IMMIGRATION AGENT AND MEDICAL STAFF OR BANKERS.—The fact that the report of the Committee supposes these officials to travel backwards and forwards from Tuticorin every day indicates that they would agree with me that this wayside station in a sun-baked desert, where the houses would be closely packed amongst a crowd of coolies, would not be acceptable for European residence. Assuming a Finance scheme to form part of the work, it is difficult to see how a banker travelling up and down with the silver necessary for the business would get through his work at all when 1,000 to 2,000 coolies were travelling during the limited time at his disposal.

(c) A special train would be required to take off the coolies for embarkation. This is an additional expense which must be paid for directly or indirectly. In the Hare Island proposal the ordinary train is sufficient.

(d) The coolies from Tuticorin would have to take their meals (previous to embarkation) at least two hours earlier than from Hare Island. As coolies do not feed on boardship, this is a point of importance.

COMPARISON OF TUTICORIN AND HARE ISLAND.—As regards (a) isolation and crimps; (b) hygiene; (c) outbreak of cholera; (d) closing of the route; (e) Ragama.

(a.) It is urged against the Hare Island Scheme that the Madras Government will permit no compulsion either in the matter of preventing natives other than immigrant coolies from landing at Hare Island or in preventing the coolies from visiting the mainland.

With regard to crimps it must be noted that these are said by Capt. Baker the Port Officer of Tuticorin to be carefully excluded from the embarkation jetty there, so that the same practice might be adopted at the Hare Island jetty. Crimps would, therefore, have to land on their own account in small boats, and would find difficult to persuade coolies who were well fed and resting from a journey to take a four and half mile voyage back to the shore while any resort to ill-treatment of the Kangan, or coolies which is the method so successfully in the Tuticorin bazaars, would be dealt with by the police under the immediate eye of the resident agent. The crimp would have no right in the lines, and would have to return at night to Tuticorin.

TATAPARAI.—When so much stress is laid on the inability of the Madras Government to exercise any interference in respect to an island separated by $4\frac{1}{2}$ miles of sea from the mainland, it is as well to study the question of isolation at Tataparai. In this head Dr. Bawa states in Clause 7 of his report to the Ceylon Government. "The chosen site cannot be looked upon as an isolated one, situated, as it is, with a large village population within a short distance of it." It is also the first station on the rails way out of Tuticorin. I see nothing to prevent the crimp from travelling by the same train as the agent, Banker and coolies returning from Ceylon and alighting at Tataparai to do his business, or, he can make Muniachi—the junction station of the Tinnevely and main lines his headquarters and travel down with the coolies from Madura. At night he can take them off into the villages referred to by Dr. Bawa.

(b.) HYGIENE.—Under this most important head the two schemes can be best compared by quoting Dr. Bawa's report, Clause 8, on Tataparai.

"As to its sanitary aspects I am of opinion that the heavy black Cotton soil containing much organic matter and boggy, and sodden during the rains, would be an undesirable situation for the collection of a large number of uncleanly human beings. A situation with a poor sandy soil would be preferable." The first is a description of Tataparai, the second of Hare Island.

WATER SUPPLY at Tataparai—though as a rule sufficient for drinking purposes, would, I should say, be quite inadequate for the ablution of the coolies, much less for the washing out of the lines. The advantages of Hare Island in this respect are too obvious to be worth going into.

(c.) OUTBREAK OF CHOLERA.—This expression appears to me misleading. It is well-known that cholera in an epidemic form is unknown in Southern India, but that, in times of famine as in 1876-7 epidemic cholera, arising from vitiated water, is so rife as to incur the name of "general outbreak." At such a time a certain percentage of coolies arriving either at Tataparai or Hare Island may be expected to develop disease contracted before they left their homes. Tataparai, described as it is by Dr. Bawa with its organic soil, limited area and surrounding village population, would not appear to be favourably situated for coping with such a contingency. On the other hand the pure air, the facilities for washing out and disinfecting lines coolies and clothing render Hare Island an ideal situation, while its area twenty times that of Tataparai would admit of any number of coolies remaining under medical supervision till the period of incubation was over. The immediate segregation of any chance cases that might so occur should be considered sufficient to practically protect Colombo from all risk of infection even without quarantine rules. Steamer agents would, of course, only issue tickets to coolies going to Colombo who had satisfied the medical authorities at Hare Island.

CLOSING OF THE ROUTE.—It must be remembered that if this route were closed the circumstances at Paumben, where the water is notoriously bad, would be no better and the general danger to our labour communication is impossible to over-estimate. In this respect Tataparai supplies a new danger to the route inasmuch as any general alarm of cholera there may induce the Tuticorin Municipality to bar arrivals from that place. At present it lies with the Ceylon Government to close the route which it is loth to do owing to the exigencies of the tea industry. I cannot therefore regard the Tataparai scheme as likely to be of service except during the existence of favourable conditions.

RAGAMA.—This depot has never been tested by cholera. In my opinion a depot at Hare Island would make Ragama quite unnecessary.

HARCOURT SKRINE.

TEA PLANTATION COMPANIES, LIMITED, IN RUPEE CURRENCY.—This compilation as a Supplement to that of Messrs. Gow, Wilson & Stanton of sterling Companies, has just left the printer's hands. It includes altogether some 50 Rupee Companies and about 120 Estates belonging to such Companies. An index for each is given, so that not only each Company, but each estate can at once be referred to. The volume should be very useful to brokers, bankers, merchants, and all dealers in tea shares.

Correspondence

To the Editor.

CEYLON TEA IN RUSSIA.

Moseow, 5/17th Dec. 1897.

A. PHILIP, Esq., Secretary to the "Thirty Committee," Kandy, Ceylon.

DEAR SIR,—I confirm my letter of the 21st August, 2nd September. Having been since, a great deal absent from Moscow and expecting at any moment the visit of Mr. Christie, I refrained of writing sooner. I had, last week, the pleasure of seeing here Mr. Christie, and while I will leave it to that gentleman to express his own opinion about myself, my business and my work, past and future, as regards the interests of "Ceylon" and "Ceylon Tea" in this country, I will refute the hostile "Editorials" which have lately appeared in the columns of the "Times of Ceylon," by stating:—

1st. That my Company has been floated with the object of continuing to push the sale of "Ceylon Tea," as well as trying to introduce Indian tea, in Russia.

2nd. That the business I have been carrying on in Russia will be materially improved by the increased capital that has been put into it, and that I will be enabled thereby to increase the outlet for Ceylon tea in this country in a way that I have not hitherto succeeded in doing, so largely as I would have wished.

3rd. That none of the Ceylon money has been used by me for advertising Indian tea, and that it has never been my intention of doing so.

4th. That in the beginning of November last, before leaving London, I have acquainted Mr. Wm. Martin Leake of the fact that my Company had been successfully floated.

It remains now for Mr. Christie to report upon the progress of Ceylon tea has made in Russia and to suggest the plans of action to be adopted in future for further extension. Enclosing copy of my today's letter* to the Editor of the "Times of Ceylon."—I am, dear sir, yours faithfully,

(Signed) M. ROGIVUE.

* The letter referred to is as follows:—

Moseow, 5/17th Dec. 1897.

Sir,—In your issue No. 46 of 18th November, 1897, I read your two editorials, "Rogivue, Limited" and "Mr. Rogivue and the Thirty Committee" which I find rather offensive, both for myself and the promoters of my Company.

While contesting (*sic*) yourself the right to blame my action, I beg to state:—(1st) That I am not and have never been a paid servant of the "Thirty Committee." I spent the money they have sent me, and a great deal of my own, in advertising "Ceylon Tea" in Russia, without any compensation whatever for my work, my travelling expenses or other charges, but the only benefit my business has gained by the "advertising." I, therefore, think that I was quite at liberty to transfer my business to a Company, without asking the permission of the "Thirty Committee" or anybody else. (2nd) My Company has not been floated to push in Russia the sale of Indian Tea *only*. (3rd) I deny that I have been "crimped" by anyone.

I shall thank you to publish this letter in one of your next issues, and remain, dear sir, yours faithfully,
M. ROGIVUE.

CEYLON TEA IN CANADA AND UNITED STATES: GOOD NEWS.

Toronto, Dec. 14th 1897.

DEAR SIR.—You will be glad to hear that our Government has placed restrictions on the importation into this country, of adulterated and low grade teas which have been refused admittance into the United States. Practically, this will not affect Ceylon and Indian Tea at all, but it will be a very serious blow indeed to China and Japan, because of the large amount of adulteration and coloring matter used in their teas.

We feel confident that it will prevent *at least* a million pounds of low-grade China and Japan Teas, coming into Canada annually, that have hitherto come in, and give us a chance to supply the people with our pure teas.

We might say that the action of our Government was chiefly brought about by the work of your Commissioner, Mr. McKenzie, and the Indian Commissioner, Mr. Blechynden. The series of articles that appeared in the American papers, on the refusal at American ports of large quantities of China and Japan teas, attracted the attention of our Government, or was rather brought to their attention by ourselves; hence their action. The insertion of these articles in the American papers was wholly due to Mr. McKenzie and Mr. Blechynden: they have accomplished a very great deal indeed, and we feel very grateful.—We are, yours truly,

P. C. LARKIN & Co.,

P. S.—We shipped a cart-load of twenty thousand pounds of tea to Boston, on the 8th. We can report splendid business prospects in the United States.

CEYLON TEA IN NORTH AMERICA:

Hampstead, N.W., Jan. 6.

DEAR SIR,—I enclose lists of tea packets being advertised in Canada, also orders sent to tea inspectors, on the subject of tea rejected in U.S. and trying to get into Canada.

Orders from "other" countries, chiefly Russia and America, are keeping up prices of low grades, which these countries chiefly take. The large blending houses here, cannot get those teas at their own prices; but to be averaged, they bid less for medium teas, and *foreign orders* do not defeat their combination. They divide breaks, instead of competing for them.

The shares of the recently formed Companies such as "Mazzawattie," are rising in consequence of the immense profits our cheap teas brought them in 1897. It is almost time a "Grower's Distribution Co." was formed.—Yours faithfully,
WM. MACKENZIE.

[We cannot fully reproduce the enclosures; but they are referred to elsewhere.—ED. T.A.]

THE YIELD OF RAMIE PER ACRE.

39, Victoria Street, Westminster, S.W. Jan. 14.

SIR,—Instead of entering into a wordy discussion with your good self, and the various correspondents who doubted my figures as to the yield per acre of Ramie stems in the Straits, I put myself into communication with Mr. Tom Gibson of Klang, Selangor, the Hon. Secretary of the United Planters' Association, who for some time past has been experimenting with Ramie for his Association, and asked him for his candid opinion as to whether my estimate of 70 ton

per acre was an excessive one. I enclose you a copy of his reply; but at the same time, as I have always said, I wish it clearly to be understood, that, these figures may not apply to Ceylon—if the Ceylon Planters wish to know what the yield per acre is, they will have to plant up one and test the results.

Correspondent D, in your issue of the 1st November last asks, how I account for the variation between the yield in Australia, and that in the Straits. My answer is, that in consequence of the dryness of the Australian climate, the weight of the stems would be much less there, than in the humid climate of the Straits, where they contain 80 per cent of water. From experiments in Kwala Lumpur, it was found that the actual yield of cleaned filasse, was $2\frac{1}{2}$ per cent. I assume that 4 per cent would not be excessive for a dry climate—we get 3 per cent in Algeria—the stems all contain the same amount of fibre; but the yield depends upon the quantity of water they contain.

As to his second question, let us see what Ceylon can produce. We will then consider how far we can meet the Planters on the question of machinery. I, however, repeat my advice: go slow; wait the result of our estate at Johore; and in the meantime test the capabilities of your land and climate.—Yours truly.

J. M. MacDONALD.

Sungei Puloh, Klang, Dec, 14th, 1897.

Messrs. MacDonald, Boyle & Co., 39, Victoria Street, Westminster, London.

DEAR SIR,—In reply to your inquiry, I may state that in my opinion your estimate of 70 tons of stems per acre is well within the mark given soil such as I have experimented on and from my personal knowledge the soil and climate of Muar where you have got a large concession of land is very similar to the soil here. I would go further and state that I consider more than 70 tons can be got, judging from results I have got since you were here—in fact the growth was so marvellous that I published the facts in our local paper and send you a copy per same mail. In addition to what I have there stated I may tell you that each of the *unrooted cuttings* planted on the 5th October last had six stems, four of which are now almost ready for cutting, and I yesterday exhibited an average stem at a Committee meeting of the United Planters Association, of which I am Secretary, and it was 5 feet 4 inches long. Further, from calculations I have carefully made and based on actual results I find that given one acre of *Ramie* say four months old, you can plant up 1,000 acres in 12 months. Please note that I am only counting on cuttings from the original acre and make no allowance for cuttings from the first and second series of plantings.

I consider you are exceedingly fortunate in getting, such a valuable concession of land at Muar and it may interest you to hear that \$5 per acre has been offered for a large area on the opposite side of the river to your concession.

As you know from experience planters want a lot of convincing before you can get them to take up a new product, and possibly you may have been disappointed that a greater interest was not taken in the matter after the demonstration you gave in Kwala Lumpur, and which, in my opinion was a success, but I may tell you that I can clearly see that a decided interest is being taken and I am confident that all those who have land suitable for the product will go in for it more or less.

In Selangor we have thousands of acres of alluvial land suitable for *Ramie* cultivation and there is also a large area in Perak, Muar Valley has also thousands of acres of similar land and it is bound to go up in value. I believe there is a great future

for *Ramie* in the Straits and the Malay States, in fact we seem to have exactly the climate required for the cultivation.

Let us produce the stems and you can do the rest and there will be no cause to grumble.—Wishing you every success, I remain, dear sir, yours faithfully,
(Signed) TOM GIBSON.

(Extract from the "Malay Mail," Dec. 9th, referred to above) *Ramie Cultivation.*

To the Editor of the "Malay Mail."

Dear Sir,—Your planter readers may be interested in the following facts as to the growth of *Ramie* in alluvial Klang land:—

1. Several clumps of *Ramie*, having an average of 20 stems each were cut down to within three inches of the ground on the 16th November last and the stools today (21 days from cutting) have an average of 40 stems, three feet to three and a half feet long and nearly half an inch in diameter; there are besides about 20 young shoots on each stool about one foot high.

2. About 150 unrooted cuttings six inches high were planted on the 5th October last and in 28 days averaged four feet in height and are now all five feet and almost ready for cutting.—Yours faithfully,

TOM GIBSON.

CEYLON HIBISCUS AND OTHER FIBRES.

London, E.C. Jan. 19.

DEAR MR. EDITOR:—I have taken considerable trouble with the Hibiscus fibre that you sent; one of the fibre firms here value this at £9 per ton, but they say that they would prefer to have this fibre sent home in the form of "ribbons." In this form the China Grass comes to the market now, and the process is very simple for treating it without breaking the fibre. In sending home any fibrous material at the present time, you must remember what the standard is, one may be for string or for weaving, the other is for paper: if it is to compete for paper you must remember that the standard is pine-wood, the pulp from which comes away perfectly white and pure, without any dirt, and cannot be valued at much over 1d. per lb., if as much as that. Ever since pine-wood pulp has got to such a pitch of perfection it is only first-class fibres that they use for spinning or for strings and rope.—Yours truly,
THOS. CHRISTY.

WOODCOCK IN CEYLON.

Ratuatenna, Jan. 20th.

DEAR SIR,—If Mr. Massy, of Carniethan, Ramboda, had read the local papers he would have come to the conclusion, that the woodcock is not so rare in Ceylon as is supposed. The common woodcock has been shot in the island, on several occasions, and as I noted last week it is an annual migrant to these parts, and I frequently come across it between the months of October and May.
E. G. R.

SCIENTIFIC MANURING AND COCONUT CULTIVATION.

SIR.—The writer of the article on scientific manuring in your impression of 28th Jan. is not *au courant* with local agricultural literature. He will find a very full and lucid summary of the startling discovery of denitrification in the November number of the "Agricultural Magazine." It will be interesting to know what English agricultural chemists of the standing of Lawes, Warrington and Gibson have to say on the subject, they will no doubt ere this have instituted practical experiments to test the results of the German scientists.

Cattle manure mixed with so-called artificial manures have been known to yield good results in European agriculture. Perhaps, it may be said that the results would have been better but for the combination. In the cultivation of coconuts locally, the addition of cattle manure to the usual mixture of castor cakes and bones is known to yield better and more lasting results than when they are applied alone. There appears to be one way of preventing or at least minimizing the denitrifying process and that is by using well-rotted cattle manure. Locally this means a well-decayed mass of vegetable matter with mostly all the potash and nitrogen washed out of it.

I believe more than one coconut estate has been experimenting with artificial manures on the lines laid down by Messrs. Freudenberg & Co. But the drawback with coconut cultivation is that the ocular and material demonstrations of improvement are so slow.

The experiments in manuring as suggested by Messrs. Freudenberg & Co. are so elaborate and impractical that I fear they will never become general. Certain substances are not to be mixed as the combination will cause the loss of nitrogen. Then again the application of the other substances are not to be made at once, but at intervals. Altogether the same ground has to be gone over from three to five times. This will add to the cost of application. Then again the mixing of the manures, their weighing and serving out will have to be done under the personal supervision of the Superintendent. He cannot delegate the work to a subordinate. Then there is the strange suggestion that the manure should be buried in *deep* holes to reach a large root surface. Usually wide holes are used to attain this object. The unwise of applying such soluble substances as those recommended, especially sulphate of ammonia, in deep holes impressed itself on me. I found this view supported by Mr. John Hughes in a recent communication to the *Observer*.

I was always struck with the yellow color of the fronds of coconut trees growing on sandy soils. I tried to account for it by attributing it to the presence of water at the roots; but against that theory was the fact that coconut trees growing on rather high, sandy soil had also yellow fronds. Mr. Leclerc has said that "the yellowing of plants is due to defective transpiration and not to excess of moisture in the soil. When the air is moist, transpiration is slow, when dry it is fast." Another authority says:—"Sandy soils are powerful attractors of the moisture of the atmosphere. On the sandy plains of Chili vegetation is almost entirely dependent on dew for its moisture." That may be one explanation. I have given the matter much thought and my theory is that coconut trees growing on sandy soils suffer from what I will call vegetable anæmia due to the almost entire absence of iron in the soil. Chlorophyl, or the green colouring matter in leaves, is found only when iron is present in the soil. Without chlorophyl the assimilation of plant food by the leaves is not possible. Anæmia may be due to other causes as well, such as debility due to want of cultivation. In red clayey or choky soils, the yellowing of the leaves from want of cultivation is not so apparent and marked as in sandy soils, for they have a large admixture of iron in their composition. In the animal economy, the red blood corpuscles take the place of chlorophyl in the vegetable economy. Their absence is remedied by the administration of iron. Iron has been proved to be applied with benefit to vegetation. We read in the "Ceylon Manual of Chemical Analyses" that "it was formerly considered that most soils contained sufficient iron for the use of plants, and that it exercised rather a hurtful effect on plants. Dr. Griffiths appears to prove the efficacy of applying iron in a soluble form even to land already containing a considerable proportion of iron in an insoluble form. He says that his original proposition, that a fairly large proportion of soluble iron in a soil is favourable to the growth of plants, developing a large amount of chlorophyl, has been confirmed by all his subsequent investigations. He strongly recommends sulphate of iron both as a manure and as an antiseptic substance for application to other manures."

This brings me to the subject of Basic slag. It is obtained when converting iron into steel in crucibles lined with limestone. Mr. Thomas discovered that the phosphoric acid in the iron combined with the lime in the limestone and formed phosphate of lime. Hence its name, Thomas's phosphate powder. He experimented with it and found it a valuable fertilizer. Its weight suggests a large proportion of iron. Perhaps Mr. Cochran will be able to tell us whether in a soluble form or not. If in a soluble form, the beneficial effects of its application to sandy soils especially will be beyond question, for by the development of chlorophyl the assimilation of the plant food already in the soil and that applied as a manure will readily take place. I should wish to see this question discussed by a scientist. B.

THE PROTECTION OF GAME.

Ratnatenne, Madulkele, Jan. 21st.

DEAR SIR,—I have read with interest your article on the Protection of Game, and am only too glad to hear evidence for the other side.

There is I admit some danger of game being over-protected, which practically comes to the same thing; as being protected for the sake of Sport and Sportsmen.

This is a danger which must be carefully guarded against.

Such proposals for the protection of game, as the returning of all *native* firearms at the commencement of the close season, may be passed over as absurd.

We come then to *reasonable* measures for the protection of game, and I am firmly of the opinion which I believe coincides with your own that the existing ordinance if really put in force, together with the establishment of *sanctuaries* for game in *un-inhabited* districts meet all requirements.

It is *not* so much in populated districts, that game requires protection as in almost uninhabited wilds.

This may seem absurd, but a knowledge of the subject soon proves the correctness of the statement. Almost all the populated districts, more especially those of the Central, Western and Southern Provinces, and great areas of the North-Western Province; are well within the influence of the two monsoons. These districts either on account of their mountainous nature or the thick growth of forest and scrub which covers the waste lands afford *almost* sufficient protection to game, without the intervention of law. In the great wildernesses of the Northern and Eastern Provinces, the habitat, par excellence, of the Spotted Axis, and Buffalo the case is different. Here on account of the open nature of the land, and the dry seasons, game of all kinds is at the mercy, not of the villager, for practically, the villager does not exist there, but of the hide and horn *merchant*. It is therefore not the villager from whose raids game should be preserved, for the Sinhalese villager at any rate, is as a general rule innocent of any idea of accumulating wealth in this line; but it is the vagabond Moor with whom we have to deal and his hunting grounds are the aforesaid open plains and dry wastes of the north and east and *no* legislation—no measures can surely be too severe to apply against him and him only.

It is perhaps not generally known, that the chief offenders are not those whom we meet down in the wilds, but that they are in our midst.

By store-keepers in Matale, Kandy, Badulla and elsewhere—a common practice amongst these scoundrels—is to obtain a licence from the Kachcheri to collect myrabolans, wild cinnamon bark or such jungle produce; with this licence, a

gang of armed ruffians is despatched to the haunts of deer; and the slaying and collection of hides and horns and peafowl feathers goes on gaily. Should any official be in the neighbourhood a certain quantity of jungle produce is kept ready in case of necessity. The licence and the produce will of course be forthcoming on the appearance of the G. A. or any of his subordinates.

Needless to say the hides, horns and meat will *not*. It is with these marauders that the Game Protection Society desire most earnestly to deal effectually; and not believe me, with the usually unoffending villager.—Yours faithfully, E. G. R.

CACAO IN UKUWELA DISTRICT.

Kaduwella, Ukuwella, Jan. 22, 1898.

DEAR SIR,—Might I suggest that you publish names of correspondents who write so dolefully to you about Cacao Disease (so called) and its probable effects. Has it never struck you that you are allowing your paper to be made a medium for the systematic depreciation of all cacao property. On this estate, I have not seen any of the disease your correspondents write about. Marakona, an estate in the neighbourhood is also free from any disease, and dare say the same can be said of a great many more estates. Why should the value (in the market) of these estates be run down by allowing anonymous correspondents to write as if the whole of the cacao estates in Ceylon were plague stricken?

Is it any new thing for cacao to die off in patches after a very wet season or even for coffee or tea to die out in small patches here and there?

I have known coffee to die out from no apparent cause and the same with tea. Do you remember the Indian planter discovering a disease in the tea plant in the Kalutara district which was going to wipe out tea entirely? This was some 6 or 7 years ago, but I am told tea is still extensively grown in Kalutara.

Eight trees have died out on this estate since I took over 2½ years ago: 4 of these were killed by white ants, and had no tap root, and the other 3 died from, what I suppose is, the mysterious disease, supposed to affect cacao, but which I put down to wet feet.

I would not have troubled you with this letter did not I consider it a duty I owe to my employers to protest against the wild writing of anonymous correspondents *re* cacao prospects. I do not think it is too much to ask that men who write on the subject should sign their letters so that one may be able to judge of the value of the opinion offered or the *facts* stated.—Yours faithfully,
JOHN MACDONALD.

[Mr. MacDonald's letter reminds us of letters we were accustomed to get from some coffee planters before Mr. Marshall Ward's arrival in Ceylon. Not that we mean the parallel to go further; for we are very pleased to learn of estates and districts, where cacao is flourishing. But we can assure Mr. MacDonald that we have allowed no one to write on the subject without being certain of his personal experience and responsibility and of his having a good purpose in writing. Now, for instance, our last contributor wrote, as he did, in order to show the Government, the urgent need of attention and of its employing an Analytical Chemist, as well as a Cryptogamist, to aid Mr. Willis in the Cacao investigation. Our present correspondent is fortunate in being in a district little affected,

we believe; but suppose he was in charge of a plantation such as was last described, and its proprietor at home, would he feel justified in writing in his own name and proclaiming the property—or would he feel justified in remaining silent, while the Government did nothing to investigate the cause of the Cacao dying out in his neighbourhood?—Ed. T.A.]

FRESH-WATER FISH.

DEAR SIR,—Now that water is at a low ebb in the fields and water-courses in the suburbs around Colombo, fresh water fish is brought for sale in large quantities into the town, where it finds a ready market, almost exclusively among natives, but there are a few varieties of these fish which are acceptable to the European palate; of these may be mentioned the *tula*, the *anda* and the *welligowwa*: all these varieties are more or less known to the older residents upcountry. When properly cooked these fish are delicious and wholesome.

That esteemed upcountry resident, the late G.A.C. was a great believer in the *tula* and he wrote in praise of it to the *Observer* in the early seventies and maintained that the *tula* compared favourably with English soles. An old District Judge of Negombo insisted on having *welligowwas* (Ceylon whiting) for breakfast every morning, and growled fearfully at his "boy" if he failed to procure them!

The *anda* (Ceylon eel) is also very much relished: old Dr. Boake was always well satisfied with a meal when the *menu* included stewed eels. Very fine ones used to be caught in the lake near Captain's Garden, nearly opposite the doctor's residence.

C.
[The Cold Storage and Refrigerating Managers are on the lookout for local supplies of fish, game, &c., to preserve and supply from time to time.—Ed. T.A.]

PLANTAIN FLOUR.

DEAR SIR,—I should be glad if any of your readers could tell me where I could obtain plantain flour. I should mention that it is required for purposes of experiment, on the result of which will be determined its suitability for certain special purposes. About 23 lb. is wanted for the test. Is there here an opening for a new industry, or is at present the local demand for the fruit in its raw state as food so great that it fully equals the supply? From what I know of plantains, the ordinary table kinds are too sugary for conversion into flour, unless, perhaps, when treated in the unripe state. Possibly, the curry plantains would answer better. I am told by an esteemed correspondent that he once made some plantain flour, but found it did not pay. Possibly since then, however, circumstances may have altered: and I shall be glad if this letter elicits information on the subject.—Yours faithfully,
C. W. H.

Feb. 8th.

DEAR SIR,—In reply to C. W. H.'s enquiry, there is no plantain flour made in Ceylon at present, but it is an article in which an immense trade might be developed. For general purposes the 'curry' plantains are most suitable: the sweeter kinds, if taken before they ripen, would be useful for cakes and dessert biscuits. The preparation of the flour is simple and inexpensive, and as to the cost of the fruit, the difference between wholesale and retail prices is so large that growers would be very glad to see not only a new industry spring up in the manufacture of flour, but another, perhaps of almost equal importance, the preparation of dried and crystallized plantains, for which we have in Ceylon several varieties specially suitable.—Yours faithfully,
PLANTER.

Ratnapura.

NO. II.

5th Feb. 1898.

SIR,—In reply to "C. W. H." and plantain flour experiments: if he will write to me, or I now give him, some useful hints about preparing the table and sugary varieties when ripe, (and a superabundance of fruit are on hand). Cut them in two, thoroughly dry in the sun (desiccate them till they rattle like apple chips). Then get some large mouth bottles or jars—pack away a layer of chips—and pour over each layer some burnt sugar and brandy, or over two or three layers. It will soak down gradually through the dry fruit. Stacked away it will keep for years and taste exactly, and nicer than, figs. It is astonishing how nourishing and supporting the food is, and it can be eaten with bread. It packs away in an incredible small space; a full bunch of one hundred or one hundred and-a-half could almost pack down in an ordinary table salt bottle. When drying the fruit, it is advisable to do it under mosquito netting to keep off flies. The squirrels too make raids upon it, and run off with great quantities. I once caught four squirrels in a day in an ordinary box wire trap. The fruit should be dried on a clean mat, and turned several times a day to get all parts evenly dried. It can be packed away when dry without brandy and sugar, but does not then taste so much like preserved figs.—
Yours truly,
JAMES GRAY.

DEAR SIR,—Your yesterday's paper has a very sensible article on retrenchment of expenditure on estates, this is a subject you will see will have to be taken up in a very short time, for, I have seen for some years back a great increase in cost of all works, this is simply caused by the present class of Superintendents, many, of the estates are in charge of. I could give you many instances; but it is not for me, nor would it do you any good in the meantime if you were to publish them. The man that has lots of coolies is the best superintendent; but, before the year is out, mark my word the man that can do his work cheapest will have the cake. I know of an estate that gave the Superintendent leave for 10 months and the man that took his place was a Sinna Dorie, got lots of coolies; cost of tea increased 5 cts. per lb and estimate short by 11,000 lb. Such are the facts the shareholders will have to face.—Yours,
MANAGER.

P.S.—I think Mr. Campbell had no right to give such a speech before Mr. H. Skrine's motion the other day at the P.A. meeting. That was how a previous Chairman in the 80's disgusted people.
M

CEYLON TEA IN AMERICA.

Kandy, 4th Feb. 1898.

RAMIE AND INDUSTRIAL WORK.
School of Agriculture, Colombo, Feb. 1.
DEAR SIR,—I am sending, for your inspection, some specimens of Ramie fibre lace—kindly made for me at the Kandy Convent—which testifies to the suitability of the fibre for delicate textile articles as well as to the excellence of the work done at the Kandy Convent. The thread was some left with me by Mr. Macdonald, of Macdonald, Boyle & Co. I also enclose specimen of fancy work done on the leaves of the elephant creeper (*Argyrea speciosa*).—I am, your faithfully,
C. DRIEBERG.

[The specimens, which are extremely interesting and well-executed, can be seen at our office.—Ed. T.A.]

TEA ESTATE EXPENDITURE AND ECONOMY:—No. 1.

4th Feb. 1898.

SIR,—Your leader today on economising labour I have read. My experience for the last two years is that I have saved 4 cents a lb. on made tea by plucking for cash. That coolies paid at so much a lb. easily pluck double the amount those do whose names are put down as a day's labour. Women at 25 cents say, as for other works. As regards coolies setting down, "as long as the tundu system holds good so long will they be discontented." If an oriental can increase his liabilities without any intention of repaying them by demanding a tundu and actually getting helped by his employer to do so by having one given him, what do you expect?

I have given up the tundu system, have been threatened with Court, given proctor's notice and leaving; but all have ended and I make when they found I did not care what they did. They all acknowledge that without a tundu they CANNOT GET MONEY. The CURE is in and on OUR OWN HANDS.—Yours truly,
MANAGING PROPRIETOR.

DEAR SIR,—I annex extract of a letter received by Mr. Campbell from Mr. William Mackenzie, dated London, 14th January, 1898, as follows:—"I have been advised by the National Bank of a credit for £4,000. I have written to New York, arranging for a continuance of our work, and should (D.V.) arrive there myself about the time this reaches you.

"I have had a proposal for some strenuous pushing in Winnipeg and West of Canada, and may do something in that quarter in view of the rising importance of the N.-W., since the gold discoveries.

"Mr. Talbot, sailed for Ceylon to-day.

"I may go to Ceylon in April, to give a personal account of my stewardship."—I am, dear sir, yours faithfully,
A. PHILLIP,
Secretary to the "Thirty Committee."

THE CACAO FUNGI AND REMEDIES.

Kaduwella, Ukuwela, Feb. 7th, 1898.

DEAR SIR,—I hear that the Cryptogamist has discovered not one, but two varieties of fungi living on our cacao. Now I do not wish to be little the work of the Cryptogamist: on the contrary, I believe, he will be able to give us valuable information and perhaps instruction. At the same time I can't help remembering the little assistance, Coffee Planters received from the labours of Messrs. Morris and Ward. In fact, I believe, coffee would have lasted 4 or 5 years longer than it did, if we had not carried out Morris's instructions in applying sulphur and lime. The lime had the effect of making the trees give an enormous crop, which in their debilitated condition was too much for them and so died off, when if it had not been for the overstimulant they might have gone on giving small crops for years. What I would like to suggest is that planters, whose estates are suffering from the disease, should select a piece of soil close to a dead or dying tree and have a sample

of it lifted and sent for analysis. To be perfect it would require four samples to be taken as follows:—a cubic foot of the surface soil, a cubic foot immediately below that, and so on, till a depth of four feet is reached. Each of these samples, on being lifted, should be carefully weighed, put in a box, and sent to the chemist as soon as possible. I think the Agricultural Chemist is more likely to give practical help than the Cryptogamist. I offer the suggestion for what it is worth.—Yours faithfully,
JOHN MACDONALD.

[We would advise Mr. MacDonald and others not to listen to rumours of what Mr. Carruthers has discovered or suggested, until they see it above that gentleman's name. We have the fullest confidence in Mr. Carruthers' prudence as well as scientific skill. At the same time experiments such as are suggested by Mr. MacDonald can never come amiss.—ED. T.A.]

CACAO LOOKING UP IN PRICE.

"The Grove," Ukuwela, 8th Feb., 1898.

DEAR SIR,—The enclosed from "the Lane" accounting for the hardening tendency of the cacao market may interest your readers. This rise in the market, unlike the inflation caused by a Trans-atlantic fashionable demand a few years ago, which came and went like all fashions, appears to be founded on a permanent basis.—Yours faithfully,
JAS. H. BARBER.

21, Mincing Lane, London, E.C., Jan. 21st 1898.

J. H. Barber, Esq., Matale, Ceylon.

DEAR SIR,—We had this pleasure on the 7th inst. and are since without any letter from you.

Cocoa P. "MAKASA MARU" ss.—We have to advise the following sales:—

		s.	d.
Leville A	.. 20 bags cocoa at ..	78	6
" B	.. 9 " " " ..	75	0
Leville B	.. 14 " " " ..	75	0
Grove A	.. 32 " " " ..	77	0
"	.. 29 " " " ..	76	6

These prices show fully 5s per cwt. advance on rates obtainable before Christmas and we trust they will be deemed satisfactory.

The rapid advance in the price of cacao has been caused chiefly by the opening of the several new manufactories such as Dr. Tibbles, whose advertisement of Vi-cacao you have no doubt seen. If as many anticipate the consumption of cacao is largely increased throughout the United Kingdom by means of such advertisements, we anticipate a very firm market throughout the spring and the earlier shipments are received here the better the result is likely to be.—Yours faithfully,

HARVEY BROS. & Co.

BORERS vs. CACAO AND DADAP TREE.

Kandy, 9th Feb., 1898.

DEAR SIR,—Herewith a block of dadap wood from a tree in the vicinity of cacao attacked by the boring beetle (*Fomicus perforans*). It may be worth while to find out why the dadap trees are bored by the same beetle "or a closely allied species" to that attacking cocoa. I have also noticed gumming—or exudation and crystallization of the sap—preceding decay of the tree. Evi-

dently fermentation of the sap, attracts the beetle. All beetles are fond of fermented liquor. Beetles and poochies of sorts are caught at home with a mixture of rum and sugar, plastered on the tree trunks. Also with porter and stont and water. The cure of the disease may depend,—on what causes the sap to ferment.—Yours faithfully,
VEDDA.

[The block of wood referred to has not yet come to hand: when it does, we must certainly have it examined.—ED. T.A.]

THE CEYLON TEA CAMPAIGN IN AMERICA.

DEAR SIR,—In a letter to Mr. Campbell, dated London, 19th January, 1898, Mr. Mackenzie writes:—"As I go to America next week, this may be the last letter from me while you are chairman. I must thank you for the interest you have evinced, and your kind dealings with me. I am sending you a report of last year's work from Mr. Larkin, and a lot of tea advertisements. I think the Committee will agree with me that he well deserves all the help he gets. He is by far our best friend. He forces others to follow in his steps."

I also send a letter from a well-known firm working in America, but with headquarters here, explaining where our teas lack the roll and make of Indians and Javas. They tell me they have been obliged to substitute Javas for Ceylon in some of their blends. Were there enough of Javas we would be great sufferers.

IMPORTANT LETTER ON DEFECTIVE MANUFACTURE.

ANOTHER "BATTLE OF THE STANDARDS."

W. Mackenzie, Esq., 39, Netherall Gardens, Hampstead, N.W.

DEAR MACKENZIE,—With regard to the conversation we had the other day in Leadenhall Street about Ceylons and Javas, I am now writing to confirm what I said about them then.

There is no question about it that many of the Ceylon teas now being imported are very inferior, both in liquor and in make, to Java teas. Until quite recently, with the exception of a few Java marks the bulk of the teas from that country were very inferior in flavour, but recently, especially during this year, the imports have been of a very much higher quality, and I make bold to say that better Java teas can be bought at 6½d to 7½d a lb., than Ceylon at 8d. Not only is the superiority marked in the dry leaf, but also in the liquor. The teas are exceedingly well made, very closely rolled with a fine amount of tip, and very heavy for bulk, compared with Ceylon teas, which are in the majority of cases very open leafed teas, and weigh very light by measure. I have before me now a Java pekoe, costing 6½d with a very pure, pungent liquor, and excellent quality. If I were to place sufficient of this tea into a one lb. tin without pressing it in, just to fill in and shave it off with a paper knife, and were to weigh the Ceylon tea in the same tin, in the same way—say a Ceylon pekoe at 7½d to 8½d—(that is, the majority of Ceylon teas) it would be found that the Java, bulk for bulk, would weigh 10 or 15 per cent more than the Ceylon tea, consequently the consumer weighing out sufficient tea, say four or five spoonfuls of Java, would use the same bulk of tea as if he took out Ceylon tea, but as a matter of fact the five spoonfuls of Java would weigh as much as about six spoonfuls of Ceylon, consequently the tea would come out stronger and better, the consumer would be better satisfied and the retailer would benefit to the extent of selling one spoonful in five more of tea by using Java than if using Ceylon. Where one is retailing hundreds of chests a week, this is a very im-

PLANTING NOTES.

portant matter, and I urge upon you to do all you can to make this fact known to Ceylon. The number of Ceylon teas that come to this market now, either very open in leaf, badly rolled, or rolled to powder, is extraordinarily large, and it seems a pity that it shuts out a great many teas from markets where they might find a remunerative outlet. Where teas are very small and very open, I fancy it must be either from a considerable over-wither, or from under-wither, whereas in the case of the Javas you only have to look at the teas to see that the withering has been perfect in every respect, otherwise the even small pekoe leaves could not be made. Of course, they might pluck finer there than in Ceylon, I cannot say, not having been to that country; but this is a complaint with all the dealers in Ceylon teas, that they don't come up to the Java or Indian teas in style of make. Were they to do so, were they to be heavier, bulk for bulk, there is no doubt in my mind that the consumption of Ceylon tea—already satisfactory—would at once show a large increase, in fact, the difference would amount to eight or ten millions in the year if it were possible by some "fait legendaire" to ensure that every lb. of tea leaf in Ceylon were rolled as well as it is possible. Of course, this cannot be so. At the same time, there are a great many go-a-head planters who, if only they knew the importance of it, would certainly take means to have their teas more closely rolled, and there is no other way I can think of in which Ceylon planters can make their produce more valuable than by paying more attention to close rolling and good make. As I told you the other day, I would rather remain anonymous in communicating this to you, and so I will simply sign myself."

I am, sir, yours truly,
A. PHILIP,
Secretary to the "Thirty Committee."

INDIAN TEA IN INDIA—is the heading of at sub-editorial in the latest *Globe* (Jan. 21) on a subject which has often attracted attention. Why should not the millions of India, Burmah, Siam, Straits, Java and Ceylon drink teas as well as the Chinese and Japanese? There is certainly room for increased consumption in Asia. If all our common teas were so used, it would be well for tea planters:—

The conservatism of the people of India is very marked in their reluctance to use their own tea. India produces annually about 137 million pounds of tea. Of this 132 millions is exported, no less than 124 millions going to the United Kingdom. Only five millions of pounds, therefore, remain in India for the consumption of 300 millions of people; while the United Kingdom, with only about 40 millions of people, takes 124 millions. In other words, India uses less than half an ounce per head per annum of its own tea, while each inhabitant of the United Kingdom consumes on the average about five and a half pounds. The contrast between these figures becomes the more marked when we learn that the bulk of the tea used in India is consumed by the English community there, no fewer than one million pounds—out of the total of five millions—being purchased for the use of the British soldier alone. It is not that the natives of India have any prejudice against the use of tea; for they like it, and rate its medicinal properties against fever very highly. It is merely that tea, as a beverage and a luxury, has not yet found its way into the daily life of the natives, although the consumption is increasing year by year among the population of the larger towns, especially among the Mahomedans. The Indian tea-planting industry has, therefore, a splendid future before it. Not only is it fairly dividing with Ceylon the markets of the world, from which the merits of both have practically ousted China tea, but in the slowly educated population of 300 millions of native Indians it will have a new market of its own in the future.

VANILLA IN CEYLON.—A young German who has been tea-planting in Ceylon for some years has purchased an estate of nearly a hundred acres, on which he intends cultivating vanilla.—*Chemist and Druggist*, Feb. 5

"THE CEYLON FORESTER."—A Quarterly Magazine of Forestry, Natural History and Shikar. Edited by H. P. C. Armitage, Assistant Conservator of Forests, Jaffna. Fourth Quarter, 1897. No. 7. Contents:—The Terrestrial Mollusca of Ambagamuwa; Para Rubber; Reviews; The Administration Report of the Ceylon Forest Department, 1896; Firewood Forests, Mirigama; Mexican Rubber; Experiments to Test Durability of Wood; Utilization of Forest Produce; Extracts; The School of Forestry, Ceylon; Sleepers on the Railway; Value of Teak.

INDIAN COFFEE IN CEYLON.—There is a very good business done in this line, chiefly among the Tamils of the Pettah and their neighbours of the Coromandal Coast. Fairly good sized parcels are often imported and there is a ready sale for them in the local bazaars. The grades are chiefly "trriage." Occasionally parcels of "Native" are brought down to Colombo, and these mixed with our own of the same name are sold to exporters, and pass off as entirely Ceylon "Native." It is generally well known that our Island's produce in this line has a better marketable value than the Indian, which has not the same delicious flavour as, that of good old Uva!—*Cor.*—Local Examiner Feb. 17

FIXING BARBED WIRE.—Commence by first passing a complete turn of wire round one end post, and securely fasten it with stout galvanised staples; then carry the wire to the other end, and having gauged the approximate distance between extreme supports, bind two or three turns of the wire round a piece of quartering, by means of which using it as a lever against the back outer edge of the post, the intervening line of wire may be tightly strained across the face of the post, where it should be secured. The lever can then be removed, and a turn of wire passed completely round and stapled to the post in order to keep the line strained. An assistant will probably be wanted during the straining process, and it will be desirable to fix spurs to the inner sides of the end posts to prevent them being pulled over. A single staple driven in each intermediate post will be sufficient to keep the wire in position, and if more than one row is to be fixed, secure the top one first and the bottom line last.—*From Work for February.*

CIRCUMSTANCES ALTER CASES.—It has been assumed that Mr. Chamberlain's reference to the proposed grant-in-aid of the West Indies was intended to apply to sugar growing. It is now pointed out—says the *Home and Colonial Mail*, of 4th February—that this aid will be offered not to support the sugar industry alone, but it is to help in starting new planting industries. If this be so it will be in accordance with the recommendation of Sir Henry Norman's commission, but it will also be unfair to planters elsewhere. For instance, how would Indian and Ceylon tea planters feel if planters in our West India possessions were assisted by the State to grow tea in competition with India and Ceylon. It is claimed that the soil and climate of some portions of the West Indies are suited to tea planting, so that such a situation might occur. When the Ceylon coffee growing enterprises came to grief, we are not aware that the State came to the rescue, nor did Parliament vote a dole to enable planters in the island to develop other products. The Ceylon planters were left to their own resources, and had to fatten on their own enterprise.

THE NEW ESTATES MAP AND DAYS OF OLD:

RESIDENTIAL PROPRIETORS V. LIMITED COMPANIES—INFLATION OF TEA SHARES—TEA PROFITS—THE T.A.

Your new Planting Districts Map is excellent, and supplies a very much felt want; but oh what visions it recalls of blasted hopes and departed friends, and oh what changes many for the better—and some for the worse!

Even the good old days of open house hospitality which plunged so many of us as youngsters into debt and which have naturally disappeared before increasing population. But how pleasant it was to be able to ride up to any bungalow between Matale North and Morovakkorale and call for breakfast and for dinner and a bed and feel that you were a welcome guest even if you had an absent host!

But the most serious change which has come over Ceylon and which will be felt much if bad times arrive, is the rapid elimination of the residential proprietary which socially and financially made Ceylon what it is today. What prospect is there for youngsters going to Ceylon now? If they have money they can play pitch and toss with tea shares which they can do quite as well in London; if they have not money they are destined to be hirelings for life and when the pinch of hard times comes to find—as has been found in some cases, already—that Directors have to do their duty to shareholders first; to their employes afterwards.

The inflation in tea shares has been followed in London as in Colombo, by a very rapid and very natural depression. Many of the shares were far too high, not only because they were and are good things in themselves but because the abundance of cheap money and the difficulty in finding investment for it drove people to be contented with a rate of interest on tea shares, which was altogether inadequate to the nature of the investment. Some good securities are as much too low now as they were too high before; but they will soon adjust themselves and find their level at about seven per cent which is what investors should look to as a fair return for tea share property.

The rise in the rupee takes a little of the gilt off tea production, but not so much as it gets credit for and it cannot be held mainly responsible for the present tightness of the money market. The wage of the cooly is the chief if not the only thing, by which the tea planter gains by a cheap rupee; and I believe a settled rupee about 1s 4d would in the long run be advantageous. Taking the day's wage at 33 cents, the sterling equivalent with a one and four penny rupee is 5'28d; surely a low enough wage, with a one and two penny rupee 4'62d and if the rise in the sterling value of the day's wage is accompanied by a fall in the silver price of tea lead, machinery and all other estate requisites which have to be paid for in gold—and which should certainly result—and by a possible fall in the price of rice, a reduction in coast advances and a rise in the price of tea all of which theoretically should follow, the apparent loss to the planter will be counterbalanced.*

The *Tropical Agriculturist* for the past year has been splendid, and the Photographs and

Biographical Sketches of our friends,—some gone and some still with us,—remarkably good, though the latter are in some cases veiled by the modesty of the autobiographer.

J. L. S.
LONDON, Jan. 23.

TEA IN SOUTH TRAVANCORE.

Mr. Joseph Fraser has returned from his visit to South Travancore and is favourably impressed with the appearance of most of the tea he saw, while the rich jungle-reserves and soil are all that could be desired. He does not think that South Travancore teas will ever attain a high position in prices; but planters can make up a good deal for this by quantity and in low cost of production. In the case of one group an average outturn of close on 700 lb. an acre was realized including plucking from some three to four years old tea, and this was turned out at about 20 cents per lb. This must be considered very good. The great trouble is that of "labour." Coolies are most plentiful at present; but when their own harvest comes in April and May, just as there is a "rush of leaf," they want to go home. With coffee, the case was different, as the ripening of crop was in September and October. For young planters with some capital and a good deal of pluck and perseverance, South Travancore should prove a good field for operations.

THE RICH TRADE OF THE UPPER AMAZON RUBBER REGION.

By Joseph Orton Kerbey.

Here is a rich country, almost equal in area to all of the United States east of the Rocky mountains. The natural products of India-rubber, balsams, nuts, hides, etc., are of such value that there must always be a market for them. Amazonia, then, can never be a poor country; the people can pay liberally for all that they need, and they buy a lot. They can produce a great many commodities—sugar, cotton, coffee, cacao—but they prefer to concentrate all their labour on the more profitable occupation of gathering India-rubber. The United States buys the greater share of their rubber, paying for it through English banks, the money being used to buy cheap English goods and cheaper German goods for this market. It may be news to some of your readers that a regular service now exists between Peru and Europe by which Iquitos obtains the benefit of a steamer direct every forty days, by either the Booth or the Red Cross line.

The principal business house of Iquitos is that of Wesche & Co., a German firm who are conceded to handle more goods for the Ucayali and Javary and the rivers behind than any other house in the Amazon country. They seem to have succeeded the Mourrailles—the senior of whom has retired after the accumulation of a large fortune, though the house of Mourraile & Hernandez still do an immense trade. The present manager for Wesche & Co., is Mr. Julio Weiss, a young German of energetic temperament, whose thorough-going methods disprove the assertion that all foreigners soon become lazy in this climate. The firm own four steamboats, which may be termed floating stores, since they ply the different rivers in Peru, exhibiting their goods on shelves at the various landings, taking orders, and receiving Caucho and other produce of the country in exchange. In answer to my inquiries, Mr. Weiss unhesitatingly told me that their stock of goods at present exceeds in value \$1,000,000, gold. The extent of their business may be judged from the fact that they receive no less than 5,000 packages of freight every month. Mr. Weiss is thoroughly German, and he proudly boasts that every one of these packages comes from the "Fatherland." Yet he astounded me by frankly admitting

* But J. MacEwan says Indian and Ceylon Tea-planters lost £2,000,000 last year through the artificial rupee!—*Ed. T.A.*

that the capital of the house was altogether American—being supplied by Messrs. Charles Ahrenfeldt & Co., of New York (Nos. 52-54 Murray street) and Paris. Every employe of this large Iquitos establishment is a fair-hired German; even the officers of their various steamboats give their orders in German.

The largest and longest tributary of the Amazon is the Ucayali, formed by the junction of the Tambo and the Urbamba rivers, in the foothills of the Andes, and flowing northward for about 1,000 miles. It reaches the Amazon some five or ten hours' travel above Iquitos. The Cancho supply, once so plentiful on the Ucayali, has become almost exhausted along that stream, and on its affluents flowing from the west. By their reckless methods of destroying the trees, the armies of *caucheros* have ruined their occupation within the old limits, and are obliged now to go to the headwaters of the Ucayali, and to the tributaries which now from the east, having their source in Bolivia and Brazil. Whenever the latter are reached, the divide is soon passed which marks the watershed of the Jurua, another large tributary of the Amazon, parallel with the Ucayali, but claimed by Brazil. The effect of the destruction of the Cancho on the Ucayali, in connection with the opening up of communication by these numerous affluents reaching the Jurua, in Brazil, would seem to be bad for Iquitos. Naturally the route from the Cancho fields *via* the Jurua or even the Purmas to Manaos will be very much more direct than *via* Iquitos. There would be a saving of 1,000 miles, at least, and the advance of the market of Manaos, with telegraph communication and regular steamer service, might more than offset the low export duties charged on Cancho in Peru. Brazil exacts 22 per cent of the value of all rubber exported from her territory, while Peru requires only 5 centavos per kilogram on Cancho and 8 centavos per kilogram on India-rubber.

Para, Brazil, December 4, 1897.

A SIMPLE RECIPE FOR LIVING TO BE A HUNDRED.

1. Eight hours' sleep.
2. Sleep on your right side.
3. Keep your bedroom window open all night.
4. Have a mat to your bedroom door.
5. Do not have your bedstead against the wall.
6. No cold tub in the morning, but a bath at the temperature of the body.
7. Exercise before breakfast.
8. Eat little meat and see that it is well cooked.
9. (For adults) drink no milk.
10. Eat plenty of fat, to feed the cells which destroy disease germs.
11. Avoid intoxicants, which destroy those cells.
12. Daily exercise in the open air.
13. Allow no pet animals in your living rooms. They are apt to carry about disease germs.
14. Live in the country if you can.
15. Watch the three D's:—drinking-water, damp and drains.
16. Have change of occupation.
17. Have frequent and short holidays.
18. Limit your ambition; and
19. Keep your temper.

SIR JAMES SAWYER, in *Church Bells*.

[Written for residents in a temperate climate.]

—ED.]

COFFEE IN B. C. AFRICA.—If the export of coffee as given in the "Gazette" is the total for the year, it shows—says the *C. A. Times*—that we have over-estimated by some fifty tons last year's crop. 853,080 lb. is only equal to 380 and about three-quarter tons, whereas the estimate was about 450 tons. A certain amount must be allowed for the coffee retained in the country for seed and consumption, but that, we should think, would not exceed 15 tons at the outside.

"SORTING TEA : NO. 1."

Machinery has done much to spoil the sorting of tea. In all the other processes machinery has improved tea, but in this, which is perhaps a very important factor to good prices, it has helped the managers to get the work done quickly and cheaply, but it has done away with the old "niceties" of the work. In the old days, when our tea was about three times the present price, we used to make Broken Orange Pekoe, two Orange Pekoes, two Pekoes, Broken Pekoes, Pekoe Souchong, Pekoe Fannings, Red Leaf Fannings, Pekoe Dust, and Dust; that is to say, eleven "sorts" of tea. And all these teas used to get different prices, ranging from ten annas as the lowest to two rupees or so for the highest, thus allowing several annas between the No. 1 and No. 2 of the Pekoes and Orange Pekoes. Nowadays, when perhaps we have only two annas difference between our best and our worst tea, it may seem absurd to "sort" carefully, and arguing on these lines, some managers have come down to three sorts—Pekoe, Pekoe Souchong and Broken Tea. Each one has come to his own conclusions from experience or expediency, and we have concluded that careless sorting is nearly as harmful as carelessness in any of the other processes of tea making. We argue in this way: If you take five pounds of Orange Pekoe and throw it into 100 lb. of Broken Tea, you have lost several annas. Suppose that the Orange Pekoe sells for 12 annas and the Broken Tea sells for six annas then you have lost $5 \times 6 = 30$ annas. Then by way of experiment you throw 8 lb. of Pekoe into 100 lb. of Pekoe Souchong, the one being sold for 8 annas and the other for 7 annas, then you have lost 8 annas. Again, if you go further than this and put 20 lb. of Orange Pekoe into the Broken Tea you may raise the price of the Broken Tea you two pice (=50 annas), but you lose $20 \times 6 = 120$ annas. It is impossible to be definite; but the conclusion is that you lose good tea by putting it into lower class tea without raising the price of the lower grade; and by leaving lower grade tea in the grade above it, you reduce the price of the higher grade.

No one makes tea so coarse as to have no Orange Pekoe in it; and, however small a percentage it may be, it would pay to separate it from the coarser teas. It is possible to carry this idea too far; for instance, by repeated cutting and sifting through a No. 14 sieve one can each time get tea of the size of Orange Pekoe, but all these mixed together would make a very bad Orange Pekoe: it would cease to be real Orange Pekoe after the first cutting, and after that it would be cut up Pekoe and cut up Pekoe Souchong, and these would also be very grey and unsightly. The perfection of sorting is as follows: The whole tea is put over a No. 14 sieve either untouched or gently disintegrated by hand; it must be a hand sieve made of cane and shaken until tea ceases to fall through freely; this makes Orange Pekoe No. 1. The tea above the No. 14 is then passed over a No. 12 sieve, and you get Pekoe No. 1. The tea is now cut up by any sort of machine or crushed by hand and again put over No. 14, which yields No. 2 Orange Pekoe; then over a No. 12, which gives No. 2 Pekoe. The residue is then sifted through a No. 10 sieve, and it is cut up time after time till all goes through. This when fanned makes Pekoe Souchong and Broken Tea. Broken Pekoe is got out of the Orange Pekoe by fanning, also out of the tea which drops through the sieves when firing, and nowadays a good deal of Orange Pekoe and Broken Pekoe is obtained by sifting the leaf before firing.

The crudest method of sorting is to cut up the tea with a machine breaker, and put it through a cylinder consisting of a No. 12, No. 10 and No. 8, then cut up the residue, or tailings, and send them through the cylinder again. By this means the work is done very speedily, but the result is, that each grade consists of a mixture of each sort more or less cut up. This style of machine accounts for the small difference in price to be found in many marks, between the Broken Tea, Pekoe Souchongs, Pekoe and Orange Pekoe. The Orange Pekoe has Broke

Tea in it, and the Broken Tea has Orange Pekoe in it, and so on, but (as stated before) this Orange Pekoe does not improve the Broken Tea, and the Broken Tea spoils the Orange Pekoe. Then, is it worth the trouble, or the expense? That is the question to be worked out by each Manager. Looking at the matter broadly, there is about 40 per cent of Pekoe Souchong and Broken Tea. Of 200 million pounds of our British tea this 40 per cent represents 8 million pounds. Of this 8 million 3 per cent is good Orange Pekoe=240,000 lb. and 5 per cent is good Pekoe=400,000 lb. and if this amount of Orange Pekoe and Pekoe could be placed on the market in excess of our present offerings, it would have a marked effect on the reputation of our tea, and this could be done by more careful sorting without lowering the prices of the Pekoe Souchong and Broken Teas.—*Indian Planters' Gazette*, Feb. 5.

PLANTERS AND THE EXCHANGE QUESTION.

The United Planters' Association of Southern India has through its Chairman, Mr. George Romilly, sent the following letter to the Government of India, Financial Department:—

As we observe that the Madras Chamber of Commerce has recently laid its views on the currency problem before the Government of India, and as we note with alarm that it advocates the adoption of what is known as the Lindsay Scheme for establishing a gold standard and thereby fixing the rupee at about 1s. 4d., I now have the honour to submit for the consideration of Government the views of this Association on the subject, representing as I believe they do, not only the interests of the educated Native and European planters whom I have the honour to represent, but also the interests of the voiceless millions of native cultivators who are as yet unaware of the heavy burden under which they are laid.

2. We agree with the Chamber of Commerce that "if India is to be saved from ruin, if she is to prosper, cheap capital is absolutely necessary to develop her great resources"; but we go further than this, and maintain that not only cheap capital is necessary, but also a rupee at its natural value in order that the export trade, which is the backbone of the prosperity of India, may not be handicapped.

3. Our two chief industries are the growing of tea and coffee. Our teas have to compete with Japan and China. Japan has recently adopted a gold currency, but has fixed her exchange (doubtless having this and other competitions in view) at the present low rate ruling in silver standard countries and is for all practical purposes one of them. China has a silver standard, and a practical illustration of her favoured competition with India was recently afforded by the starting of the Foochow Tea Improvement Co. which in its prospectus lays stress on "the advantage China now has over India and Ceylon in cheap silver the exchange value of the rupee exceeding that of silver by fully 25 per cent." But taking the present intrinsic value of the rupee at between 9d and 10d and the exchange value at 1s 4d the actual advantage in favour of China amounts to 60 per cent. In like manner our coffees have to compete with those of Brazil and Central American States. Brazil has nominally a gold standard, but owing to bad financing the Milreis, its standard coin, has fallen in value during the past ten years from 27d. to between 8d. and 9d., so that for all practical purposes Brazil is a country with a currency on a level with that of all silver standard countries. Costa Rica and the other coffee exporting countries of Central America have a silver standard, and consequently, with Brazil, enjoy the same advantages in their competition with Indian coffee as China and Japan have in the tea trade.

4. The Madras Chamber of Commerce admits that "Indian producers will be heavily handicapped in competing with silver using countries by a fixed 1s. 4d. rupee; but to attempt to fix a lower standard

does not seem to be within the limits of practical politics." It is this prejudication which we would oppose. In our opinion the true solution of the present difficulty lies in the reopening of the Mints. We believe that if this were done a great stimulus would be given to the export trade of the country and capital would be again attracted. The only obstacle, which unfortunately has been allowed to overshadow the whole question, is the loss that would be entailed on the Government of India by its Home Charges. This, we believe, would be largely compensated by the increased trade and prosperity of the country, but if fresh taxation became necessary to meet the requirements of Government we as producers would prefer to submit to a small direct export tax on our producers than to have to struggle against the present crushing handicap in favour of produce from silver using countries.—*M. Mail*, Feb. 15.

A NEW IRON TEA FACTORY.

The old factory at Dunedin, Yatiyantota, which was totally burnt down some months ago, has been rebuilt and tea is made there now. The new factory is a neat and handsome building, designed and erected by Messrs. Walker, Sons & Co., of Colombo. It is 112ft. 6in. long by 35ft. 6in. wide, with engine and boiler house at one end, and a spacious firing room at the other. The office and sifting room are finely situated and fitted with large glass windows. The main staircase, which is 8ft. 11in. wide, a part for ascent and part for descent, gives a fine appearance to the factory. The woodwork is all of well-seasoned teak, and all the materials are of the best workmanship. The factory was built in 2½ months' time, and it reflects great credit on this enterprising firm in being able to get work done so rapidly and so well. The executive engineer was Mr. E. B. Rose, assisted by Mr. Peter C. Dias.—*Cor.*

THE PROPOSED LABOUR FEDERATION.

(From the Proceedings of the Ceylon Planters' Association, held 17th February, 1898.)

The SECRETARY took up the Rules for the proposed Labour Federation saying that they had been published in minutes of the proceedings of the Committee.

The proposed rules were taken as read.

THE PLANTING MEMBER.

The Hon. Mr. CAMPBELL said it was his duty to bring before the meeting the proposed Rules for the Labour Federation of Ceylon. They did not pretend these rules were in any way faultless. They knew it was a difficult task to make rules which would satisfy every one in a matter of this sort. He would call their special attention to rule No. 3. That rule was framed with the object of stopping roving gangs of coolies. They all knew how difficult it was to keep these gangs of the coolies on their estates and the object of this Federation was to endeavour to get the coolies to stop on the estates on which they were. If once they would get their coolies to stay with them for long periods a great many of their difficulties would vanish; they would turn out the work much better and would be more content, would earn better wages and would be in a better situation. If they agreed among themselves to get every planter to put his name down, and agreed that in no case would they give more advances than the amount put in the *tundu* they would go very far towards settling the labour difficulty.

They did not insist, in the event of any planter wishing to part with a gang, upon anything. There would be no objection to his putting on the *tundu* anything he liked. He wanted to part with them and there was no reason why they should not go to take the debt; but when their kangani came to them and said he wanted to go they said: "Here is your *tundu*." They wanted to prevent him going to another estate and getting a larger amount than they had given to him. If they did this it would prevent the Coast advances rising. If they accepted these rules that day it was but the first step. They had taken the initiative as the P. A., but the P. A. could not carry it through themselves. Everyone must help. They had limited the number of those who must support it at 75 per cent, and otherwise it could not take effect, but he hoped every planter would join the Federation and give it all the assistance in his power. He would appeal to every planter in Ceylon. Even if they could not consent to all the rules, but then at all events give the thing a trial. If they did not they remained as they now were, in the hands of their coolies, and could only go from bad to worse.

Mr. HUXLEY:—Seconded.

Mr. A. M. FORBES then asked that the rules should be read, and they were read by the Secretary.

Mr. FORBES said he could not follow Mr. Campbell in his remarks as to Rule 3. He said that in the event of their giving a *tundu* wishing to get rid of a gang of coolies, it was immaterial whether they put the amount of the advances due to the estate on it or coupled with a any number of advances representing outside debts. He took exception to that. He thought it should be understood that when they gave a *tundu* to a gang of coolies leaving an estate they should have nothing to do with outside debts whatever (applause), and that only the amount due on that estate should be put in the *tundu*.

Mr. FORSYTHE said he would like to ask what the mover would do if the kangani said "unless you include all the debts on my *tundu* I am afraid I cannot get the money in. I am afraid the coolies will run away and we shall lose half the money."

Mr. SKRINE said he supported the last speaker. It appeared to him to be class legislation. They would be putting the kanganies in a very tight place, especially on estates working on short time. The Chetty kept the coolies going and they incurred debt. In that case it was very hard if he could not get his money. If they did put the kangani in a tight place, it would do great harm to the kangani system which had worked so admirably. Indian planters, who knew the indenture mischief, knew how fortunate the planters of Ceylon were in having this kangani system. He thought something might be done to compel chetties to notify their claims to kanganies or the estates, but, as to the resolution itself, for his part he should demur before having anything to do with the rules.

Mr. A. M. FORBES said that in regard to what Mr. Forsyth had said, in the event of a kangani coming to them and saying "If you don't give me a *tundu* for so and so, part of the advances on the men, I shall have no end of difficulty in getting the money I owe you," he took exception to that. He said that if they did such a thing they ran the risk of laying themselves open to compounding a fraud. A kangani came to them and said he owed the kaddies this and

that and the other, and what proof had they got of that. If they gave him a *tundu* for the advances actually due to the estate plus the imaginary advances he owed the kaddies, he thought they were lending themselves to what might be a fraud (hear, hear).

Mr. L. STUART said he would like to say that the whole scheme at present seemed very incomplete, but at the same time he thought it was a step in the right direction, and he hoped the move might be made (hear, hear).

The CHAIRMAN said that the few words the last speaker had said was just what the Committee thought. The Committee did not pretend to have a perfect scheme. They had done the best they could to prevent the roving about of kanganies. It was chiefly the head kanganies this would effect. The sub-kanganies would not be down in the estate books, and therefore they were obliged to take their head kanganies' word and when they were paying off a sub-kangani they must take what they agreed to between them. It was to prevent whole gangs leaving estates for the sake of compelling one estate to give them more advances. Now the one estate could refuse and the kangani demanded his *tundu* and went on to the next. The proposed rules had been largely supported, and if three-fourths of the planting community were prepared to give it a chance of working for one year, they would, he was confident, be able to improve their rules by finding where the fault lay. He thought it was worth their while to give them a chance, and he did not think it would inflict a hardship on the kanganies. He thought that under Federation they would find that after all the planters were their best friends. They were protecting them from being lifted from one estate to another, because the creditor pressed them. And he thought, when it was found they did not go, the creditor would not press them. Let them give it a trial, and before the first twelve months were out, he thought that they would strengthen the rules, that they would see the weak points in them and would have a much more workable scheme for 1898. (Hear, hear).

The question was then put to the meeting and the rules were passed with only one member (Mr. Forbes) dissenting.

CACAO DISEASE.

(From the Proceedings of the Ceylon Planters' Association, held 17th February, 1898.)

Mr. H. DE SANCTIS moved:—"That this Association do have an analysis made of the whole of the cacao tree, leaves, branches, stem and pods." He explained that some time ago he saw it advertised by Messrs. Freudenberg & Co., that there were reports by Mr. Cochran, but the pamphlet stated that there was no definite information available on the subject, and it struck him that that Association which had spent two or three thousand rupees on coffee might afford to spend two or three hundred rupees on cacao so as to prevent disease. If there was something wanted in the soil they wished to find that out and when they knew what a healthy tree was made of they would know what to supply. The cost for each analysis would be Rs50, making Rs250 in all.

Mr. RYAN seconded.

Mr. CHRISTIE said that as they were discussing a scientific matter in connection with cacao disease he would like to give some little information to the Association in regard to the non-appointment of a Government cryptogamist. He had

noticed in England and since he came out here various paragraphs, some from newspaper correspondents and others of more or less an editorial nature, putting the saddle upon the wrong horse. The Governor as they knew was extremely prompt in the matter and did his very best. When he got home he went to the Colonial Office and found that they had been equally prompt. He found that they had a despatch from the Director at Kew, which had since been published in Ceylon, in which he practically declined to send out a cryptogamist and suggested in the meantime getting a botanist from India. He was not at all satisfied with that and thought there was something behind it. The Colonial Office were good enough to arrange an interview between him and the Director. He heard all the Director had to say and he was not satisfied with it, but the Director showed him a letter written by their Peradeniya Director about that time specially asking him not to send out a cryptogamist—that he did not think it was fungoid and that it was inexpedient to send out a cryptogamist. Therefore it was at the request of the Peradeniya Director that a cryptogamist was not sent here. In making this explanation he did not wish it to be thought that he was blaming the Director; doubtless he did it with the best of intentions; but the effect of his letter naturally was to prevent the Director at Kew agreeing to the request for a cryptogamist.

The CHAIRMAN thought the request made by the mover of the resolution a very small one and one the Association could easily and readily comply with. He thought that it would be on the proper lines and that a Sub-Committee would be the best to see that the proper samples were given to an analyst. A Sub-Committee could be appointed at an early meeting to carry out the suggestion made by Mr. De Sanctis and the Association would be prepared to pay the tees.

This was agreed to and the Chairman intimated that the matter would be brought up at the next Committee meeting.

THE CURRENCY QUESTION.

To the Secretary, Ceylon Planters' Association Colombo.

DEAR SIR,—At the last Annual Meeting of the United Planters' Association of Southern India, I was instructed to address all the large Produce Associations, Chambers of Commerce and Mill Owners in India and Ceylon with a view of ascertaining whether they would join us in forming a combination for the purpose of representing to the Secretary of State for India and the Houses of Parliament the critical condition of the producing industries of this country; and to forcibly point out that if the present financial policy is long continued the export trade of India must seriously suffer, with the result that the final position of the Government of India will be worse than if it had never made the fatal blunder of tampering with the currency.

2. In accordance with this resolution I beg to request that you will favour me with the views of your Association. (a) On the closing of the Mints and the General policy of the Government of India in endeavouring to create an artificial rate of exchange. (b) On the effect that this artificial rate has had on your industries.

3. With regard to ourselves the effect of the present financial policy of the Government of India has been as follows:—Our chief industries are the growing of coffee and tea. Our coffee has to compete with Brazil, and our tea with China and Japan. Taking the present intrinsic value of the rupee at between 9d and 10d the Government has forced it up to 1s 4d or 60 per cent. over its real value. Brazil has nominally a gold standard, but owing to bad financing the value

of its standard coin, the milreis, has fallen during the past ten years from 27d to between 8d and 9d, so that for all practical purposes Brazil is a country with a currency on a level with that of all silver standard countries. As a result Brazil has flooded the markets with coffee which she can sell profitably, owing to her low rates of exchange, at 40s per cwt. In India, on the other hand, under existing circumstances coffee cannot be produced at a profit under 80s per cwt. Luckily owing to its superior quality it can still command this price, but it has to compete with the better quality coffees of Costa Rica and other silver standard countries of Central America. We would point out to you that this action of the Government of India in maintaining an artificial rate of exchange act as a bounty in favor of those countries of 60 per cent.

4. In like manner our teas have to compete with China and Japan. The former has a silver standard, and Japan, though she has recently adopted a gold standard, has fixed her exchange (doubtless having this and other competition in view) at the present low rate ruling in silver standard countries, and is for all practical purposes one of them. Here again, owing to the action of the Government of India, China, and Japan enjoy a bounty of 60 per cent. Although Indian and Ceylon teas have been able to wrest the British and Colonial markets from China and Japan, they have only succeeded in doing so owing to their low rate of exchange in the past, and even then at a cost to themselves of more than 50 per cent. reduction in the price of their teas. It must further be borne in mind that Chinese and Japanese teas, although inferior in quality are still selling for a higher price in silver than ours and that the Japanese exports have increased during the last twenty six years, from 18½ to 60 million lb., and the Chinese from 236 to 239 million lb. This increased export has so far found an outlet in the markets of Russia and the United States, where our competition has been less keen. The struggle that is to come must be to conquer these markets, involving in all probability a further fall in the gold price of tea. In view of these facts, we maintain that it will be impossible for Indian and Ceylon Planters to continue giving this bounty of 60 per cent to their rivals and yet compete with them successfully in the world's markets. It seems to us that the future prosperity of India and the safeguard for its increasing population, shielded by Government from war and famine, depend mainly on the cultivation of the enormous tracts of waste land that it contains, and as pointed out in the Indian article of the London *Times* this has hitherto been effected by the cultivation of articles of export such as tea, coffee, juce, cotton, wheat and seeds. Owing to the constant opening up of new countries and increasing facilities of cheap communication with the world's markets, the gold price of India's produce is more likely to fall than rise. It seems therefore the height of folly for the Government of India deliberately to throw away the advantage which a low exchange gives the export trade of India in their severe competition with both gold and silver standard countries.

6. We shall be told that the loss to the export trade is largely balanced by the gain of the import trade, but the latter is a much smaller trade than the former, is not so necessary, and depends for its volume largely on the power of the exporters to purchase imports. If the export trade suffers the import will also suffer proportionately, and the better off exporters are the more imports they can purchase.

7. We are well aware that the Government of India is not in a position to forego the saving now effected in sterling charges without increasing its taxation to a considerable extent. But we believe that if Government were to re-open the mints and refrain from tampering in any way with exchange, the export trade of India, under a low exchange, would very rapidly increase, (as has been exemplified by the coffee and wheat trades of South America) and that with increased land and other sources of revenue the imposition of a direct 5 per cent. export duty would be found sufficient to cover the loss on

the home charges. We, as producers, would infinitely prefer to submit to a direct tax than suffer this indirect loss of 60 per cent.

8. Our proposition, therefore would be that the Government of India be requested to re-open the mints that refrain from tampering in any way with the rate of exchange, and that it should refund itself for the losses caused by this policy by the imposition of a 5 per cent. export duty.

Requesting that you will favour me with your views at an early date,—I am, dear sir, yours faithfully, (Signed) A. RONALDSON, Acting Secretary, U.P.A., S.I.

MINOR PRODUCTS REPORT.

CINCHONA BARK.—The first London auctions of the year took place this week. They began quietly, and the average unit selling price at the beginning of the auction was 1½d; competition grew keener afterwards, and rates rose till at the close the average unit for the whole auction worked out at fully 1½d, or an advance of ¼d on the last London and Amsterdam auctions. The purchases of all the principal buyers are stated beneath, first in packages and then in kilos of quinine equivalent:—

Howards & Sons	Agent for Amster- bach Factory.	Agents for Mannheim and Amsterdam Factories.	Agent for Brunswick Factory.	Agent for American Factory.	Agent for Imperial Factory.	Other Buyers.
116	386	777	438	219	71	24
565	1,195	2,190	885	1,060	360	—

The following shows the days at which other descriptions were sold:—*Ledgeriana*, Javan sold at 7½d to 7¾d for rich ("Hybrid-Ledger") chips, 6½d for good dusty chips, and 2½d to 2¾d for poor dusty chips; East Indian sold at 6½d to 7d for rich, part broken quilly chips, 5½d for good chips and quills, 5½d to 3¾d for good to poor stem chips, 4½d for root chips, and 4d to 4½d for branch chips. *Officinalis*, East Indian sold at 5½d to 5¾d for renewed broken quills and chips, 4¾d to 5d for original ditto, 4¾d to 5½d for renewed chips, 3½d to 5d for original chips, 4d for original chips and thin broken quill, 4d for root chips, 3½d to 3¾d for poor thin chips; Ceylon sold at 9d for rich shavings, 4½d for original quilly chips, 3½d to 4d for original chips, and 3½d for renewed chips. *Succirubra*, Ceylon sold at 4¾d for good bold chips down to 3d for fair small chips, 3½d to 3¾d for renewed chips, 1½d to 3d for mixed chips, shavings, and broken quill, 2¾d to 2½d for chips and shavings, 2½d for poor thin quill, and 1d to 1½d for the lowest parcels.

CINNAMON.—Chips sold this week at auction at 2¾d and cuttings at 8¾d. 40 bags of the former out of 210 offered were disposed of, and all the 14 bags of the latter put up were sold. As regards *Quills*, a very good business has been done since the last auctions. The spot prices for the various grades are unaltered, but very little is to be had at what we quote, viz. 11d for firsts, 10½d for seconds, 10d for thirds, and 9d for fourths; the price for the usual assortment to arrive is 9d c.i.f.

OIL OF CINNAMON.—The cases which were taken out of last drug sales were offered together with others at public auction this week, when the whole of the 57 put up were sold "without reserve and with all faults" at from 1½d. per ounce to 3¾d. per ounce, the lower price being for oil mixed with water. All of these cases were "salved" from the Kawachi Maru.

OIL OF LEMONGRASS.—The present circumstances of the market are favourable to the currency of conflicting reports. It is known that pretty strong efforts are being exercised in opposing directions, one to advance, the other to depress the price, owing to a cause which we spoke of a fortnight or so ago. It seems clear, however, that very little actual business is taking place, through many inquiries are said to be about. For good oil some holders asked 10d. spot

whilst a medium quotation is 8d., and in one quarter 6d., is being named, but for what sort of stuff we do not know.

VANILLOES.—The tins of these taken out of the last drug sales, as explained in a previous issue, were put up at auction last Friday, when practically the whole of the 150 offered were sold at unchanged rates. The following shows the range of price for the descriptions sold. *Seychelles*, fair to good beans sold at from 25s. to 26s. 6d. for 8 to 8½ inches, down to 18s. to 22s. for 4½ to 6½ inch. *Mauritius*, fair to good beans sold at from 21s. to 22s. 6d. for 6½ to 7 inch, down to 16s. 6d to 18s. for 3 to 4½ inch.—*British and Colonial Druggist*, Jan. 29.

PLANTING NOTES.

"SORTING TEA."—We call the attention of planters to a deliverance on this subject from the *Indian Planters Gazette* given on page 644. It is the first of a series of papers on a topic which is of practical interest in connection with Factory operations.

BASIC SLAG FOR MANURE.—In the course of last year arrangements have been perfected at Rotherham by the Parkgate Iron and Steel Company for the utilisation of the waste or by-products of the manufacture of basic or open-earth steel. Plant has been erected in a specially-constructed building for the purpose of grinding the basic slag as fine as flour, extracting the metal, and leaving a valuable phosphate manure, which is used in this country and on the Continent. The company's plant is adapted to turning out some 20,000 tons per annum.—*British Trade Review*, Feb. 1.

CEYLON PLANTERS IN HAWAII.—Mr. Hawke, of Orion, who is constantly making trips abroad from Ceylon, returned yesterday, after visiting a part of the world that Ceylon men do not often reach. Leaving Ceylon his intention was to travel *via* China and Japan to America, and so to Europe. China he did not like; but he thought Japan pleasant, and he stayed there two months. Going on to San Francisco *via* Honolulu. On his way to 'Frisco a fellow passengers on the steamer revealed himself to him as Mr. Caine, formerly of Ceylon and told him how well he was doing as a coffee-planter in Hawaii. Mr. Hawke was so interested that when he reached 'Frisco he went back to Hawaii, and he now returns from there perfectly enamoured of the place. He says the island is most suitable for Coffee planting, and a good acreage is already under cultivation, growing in rich volcanic soil—a soil that could not be found in Ceylon anywhere. Labour was plentiful, shipping facilities excellent, and Hawaiian coffee was fetching 80s a cwt. He secured 400 acres of land at an elevation of 2,000 ft. from the Provisional Government, and he returned at once to Ceylon to make arrangements to sell Orion estate and settle down in the Sandwich Isles to plant up his new property. Almost all the coffee there is Arabian.

DEAFNESS.

An essay describing a really genuine Cure for Deafness. Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON.

MARKET RATES FOR OLD AND NEW PRODUCTS.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for March:—

Vol. IX.]

MARCH, 1898.

[No. 9.]

SEASON REPORTS.

ESTERN Province.—Paddy. Maha harvest begun, preparations in some places for Yala. Rainfall, light. The supply of fruits and vegetables was poor.

Central Province.—Paddy. Crops in various stages, prospects are considered good. Rainfall recorded in Matale, 6·19 in. No reports of cattle disease.

Northern Province.—Paddy. Crops in ear, and being harvested in some parts. In Jaffna district want of rain and the disease known as "Kurukutti" has damaged the crop, while floods have done damage in the lower lands in Mullaittivu district. Health of cattle good. Rainfall in Jaffna 3·75 in., and 3·57 in. Mannar.

Southern Province.—Paddy. Maha crop being reaped, prospects fair. No. cattle disease. Rainfall 4·20 in. in Galle.

Eastern Province.—Paddy. In Batticaloa some damage to early Munnari crop by drought, late crop in good condition and fit for reaping. In Trincomalee crop in ear, some damage by rain. Cattle murrain has almost disappeared from the Province. Rainfall in Trincomalee, 12·51 in.

North-Western Province.—Paddy. Harvest time on or approaching and prospects good. Cattle disease prevails in many places. Rainfall at Puttalam 1·93 in.

Province of Uva.—Paddy. Fields in preparation for Maha. About Badulla crops are nearing

maturity. Fruits and vegetables plentiful and cheap. Health of cattle good.

Province of Sabaragamuwa.—Paddy. Maha being harvested, weather favourable and prospects good. Province free of cattle disease. Rainfall at Ruanelle 3·48 in.

PROFESSOR WARRINGTON ON THE DENITRIFICATION QUESTION:

MORE REASSURING NEWS.

(*Communicated.*)

As was to be expected, our leading English Agricultural authorities have been critically examining into the startling results of the German

experiments with reference to which Dr. Somerville first made a communication to the R.A.S.E. Journal of September last. We have already had Dr. Bernard Dyer's delivrance (summarised in the *Observer* of the 3rd instant,) and now follows an exhaustive paper, covering 30 pages, written by no less an authority than Prof. Warrington, on the same subject. The Professor, after clearly stating the conclusions arrived at by the German experimenters, begins by tracing the history of the denitrifying question, referring to the labours of Dr. Angus Smith (1867), Mensel (1875), Deherain and Marquenne (1882), Dr. Frankland, Gayon and Dupetit (1886), Burri and Stutzer (1895.) It has been proved to satisfaction that the reduction of nitrates is due to certain bacteria present in abundance in the soil, in the atmosphere and all forms of organic matters; in facts these organisms may be said to be universally distributed. Their action, however, is controlled and regulated by conditions and circumstances.

There is reason to believe that animal excrements contain a greater abundance of the denitrifying organism. For one thing it may be taken for granted that denitrifying bacteria, like other bacteria present in food, pass uninjured through the intestines of animals, and will therefore be present in larger relative proportion in the solid excrement than in the original food. Again, the proportion of organisms will depend largely on the extent and character of the exposed surface, and on the length of its exposure to the atmosphere. The denitrifying bacteria belong to a class of organisms requiring oxygen, free or combined, to accomplish their work. Nitrates contain a relatively large proportion of oxygen. It has been found that nitrates in the soil steadily diminish as the proportion of oxygen present decreases, and that denitrification is at a maximum when no free oxygen is present, as in soils saturated with water. Where then does the denitrifying organism get its essential oxygen? From the nitrates which contain it in a combined form, and which, in giving it up, become reduced to lower compounds of nitrogen, and even to nitrogen gas itself.

What, perhaps, most controls the process of denitrification is the supply of organic matter. The abundance of the organisms is of little importance, since they are always present in some proportion, and will increase and multiply if the conditions are favourable. If the organic matter is small in quantity the denitrifying action will be proportionately limited, however large the supply of bacteria. Here, says Dr. Warrington, is where the German experimenters erred,—they sought to explain denitrification as due to the supply of additional organisms in the manures, when the results were really due to the supply of an excess of organic matter. In the absence of oxidisable organic matter it is the *nitrifying* organisms that command the situation, while with abundance of a combustible carbonaceous substance the *denitrifying* bacteria spring into activity. It is pointed out that in the German experiments with pot culture, while the quantities of nitrogen (estimated as such) was the same in different experiments, the quantity of *organic matter* was very different in each case. With intrate of soda, for instance, no organic matter was supplied; with urine and dried blood the

supply was very small; with cattle manure it became very large, and indeed the German experiments themselves bear out the fact that the denitrifying action increased with the increase in the supply of *organic matter* in the manure.

Some may demur to the statement that organic matter induces denitrification, and it would, therefore, be necessary to explain that the influence of decomposable organic matter affects the process both of nitrification and denitrification. The decomposition of organic matter and its partial oxidation must precede its nitrification. If much of this preliminary work has to be done, the commencement of nitrification will be delayed; the products of the decomposition of carbonaceous matters are, indeed, inimical to nitrification. When the proportion of organic manure exceeds a certain proportion therefore, it will be understood that a nitrifying medium may be converted for a time into a denitrifying medium, the oxygen demanded by the decomposing organic matter being now obtained by the destruction of the nitrates in the soil. An organic manure which is effective when applied in moderate doses, may thus become injurious when in excess. Dr. Warrington then goes on to show that this fact, viz., that large doses of fermentable organic matter retard the nitrification of other easily nitrified organic manures, must explain the evil effects resulting in the German experiments, since in these pot experiments the additions of dung were equivalent to 40, 70, 100, and in some cases 300 tons per acre! These are quantities which, of course, are never heard of in practice, so that the great delay of the process of nitrification and the production of active denitrifying conditions, was only what was to be naturally expected under the circumstances of the experiments, and is no proof that the same action will occur to the same extent in ordinary cultivation.

But again, all kinds of organic matter have not an equal effect, and quantity alone does not determine results. We must grasp the fact, which Prof. Warrington tries hard to impress on us, that denitrification is determined by the presence of *fermentable* organic matters. Hence it was that even in the German experiments black humified horse manure, and dung applied two months before the addition of nitrate of soda, did not cause any great loss by denitrification, while the use of fresh manure resulted in considerable loss; and again sheep manure, which contains less organic matter per unit of nitrogen, and that too in an easily nitrifiable form, gave much better results than horse and cattle manure. Prof. Warrington adds that superphosphate and kainit decreased the fermentation of manure when added to it, and in this way intensified its denitrifying power. Reference is made to a very significant German experiment made with the object of arresting the denitrifying action, by destroying the denitrifying germs in dung by treating it previously with bisulphide of carbon, with the result that denitrification was as active as ever! We could not, says Prof. Warrington, have a more conclusive proof of the fact that the presence or absence of the organisms in the manure is a matter of indifference so long as the neces-

sary organisms are present in the soil. The conditions of the German experiments, contends Prof. Warrington, were clearly not such as to allow organic manures to be employed to advantage, and the results cannot be taken as indicating what may be expected to happen in the ordinary use of farmyard manure, for Prof. Wagner is himself found to admit that his former experiments showed that under *conditions which occur* in practice a large proportion of the nitrogen of farmyard manure is recovered in the crop.

We now hear of another series of pot experiments carried out at Pas-de-Calais by Pagnoul, the results of which showed that with moderate applications of dung (that is the solid excrement of manure, which in the German experiments gave the very worst results) amounting to 20 tons per acre, the return obtained from nitrate of soda and sulphate of ammonia is not decreased; indeed, in every instance the dung itself contributed to the increase of crop. Lengthy reference is then made to the Rothamstead experiments bearing on the question. Here, too, we are told that the returns yielded by nitrate of soda and ammonium salts applied with farmyard manure were "remarkably good." In one particular experiment, however, we find that when rape cake and farmyard manure were used together in certain quantities, the return was not so good (in the case of a root crop) as where rape cake was used alone; from which Prof. Warrington concludes that with 2,000 lbs. rape and 14 tons manure (the quantities used) we apparently reach an amount of organic matter in excess of what can be economically used in an average season.

The danger of denitrification reaching considerable proportions will, it is pointed out, increase as the amount of fermentable organic matter in the soil increases, and will be much aggravated by a wet condition of the land. Those who employ dung in large quantities are, therefore, more likely to suffer loss from denitrification. The mode in which farmyard manure is applied and the extent to which it is incorporated with the soil must, says Prof. Warrington, have some influence upon its action. Where it is ploughed or dug in, and thus not intimately mixed with the whole soil (as in pot culture), it would be left in a succession of layers separated by unmanured soil. The denitrifying zone is, so to speak, limited, and does not include the whole of the soil penetrated by the roots. There is thus, says Prof. Warrington, much scope for careful enquiry as to the most profitable method of employing dung with other manures. The results furnished by the field experiments at Rothamstead, both with farmyard manure and with straw (the most powerful denitrifying agents according to the German experimenters) do not substantiate the conclusions arrived at by them. The results obtained must be considered to be due to the special conditions of the experiments, and particularly to the large relative quantities of dung or straw which were employed. Prof. Warrington then indicates the lessons to be learnt from these famous experiments. One fact, he says, which we are taught is that ordinary farmyard manure is valueless as food for plants until it is nitrified,

while the economy of large dressings becomes very questionable. Moderately dry soils are those most likely to yield a profitable return with farmyard manure; hence the importance of drainage. Prof. Warrington in conclusion points to the great variation in the manurial value of cattle manure, showing that its effect is clearly connected with the active and soluble nitrogenous matter it contains, while it has been shown that to the fermentable organic matters—of which the solid part of the manure is mainly composed—is to be traced the source of denitrification. The original voidings of animals, he points out, have a far greater manurial value than the final product of the manure heap. Loss of nitrogen goes on in the whole progress from the stall to the field. One practical conclusion arrived at by the writer is the economy of keeping animals *on the land* whenever practicable.

It will be seen from the resumé which has been attempted, of Prof. Warrington's exhaustive paper, that it in a great measure disposes of the difficulties created by the German experimenters, while it also deduces many useful and practical conclusions on the subject of manuring which should prove of great value to local Agriculturists. C. D.

OCCASIONAL NOTES.

Mr. D. C. Jayawardene, an old boy of the School of Agriculture has, we are glad to learn, established himself as an agent for seeds. Mr. Jayawardene was a successful student at the School where he was particularly good in field work. After completing his course of study he was for some time under Mr. J. H. Barber, and is at present on Abbotsford, Nanuoya. We understand that Mr. Jayawardene has opened out a pretty extensive garden on his own account, and we hope to hear of him before long as a local Sutton or Carter. We can highly recommend the seeds of vegetables and flowering plants supplied by Mr. Jayawardene, who has also drawn up a Catalogue of the different varieties he keeps in stock.

We have been asked to state what is the proportion of blood in the carcase of cattle, and the percentage of water in the blood. Steel in his Treatise on the Diseases of the Ox mentions that the blood of the ox forms $\frac{1}{2}$ th of the weight of its body (that of the horse being estimated at $\frac{1}{3}$ th). Roughly blood may be said to yield on evaporation 20 per cent solid residue, and 80 per cent water.

The Sugar Industry in the West Indies has come to a critical condition, owing to low prices and the large importation of Indian Cooly labour. Demerara, which is not making its profits out of sugar, has just now half a million of coolies on hand. "These coolies," says the *Indian Agriculturist* for March last, "must by the contract made with the Indian Government receive constantly three shillings a day, or else Demerara must pay their passage and expenses back to India. Say that costs £10 a head, Demerara cannot get rid of her coolies without paying a fine of five millions. She must therefore go on Sugar growing whether she likes or not. But, wherever sugar can be grown rhea can be grown also; and cooly labour is quite

sufficiently skilled not only for cutting the crop and stripping the bark by hand or machine, but also for preparing the filasse."

An Ideal Department of Agriculture and Industries is the subject of a paper reprinted in the Year-book of the Department of Agriculture, 1896.

The report of the Parliamentary Recess Committee on the proposal to establish a department of Agriculture and Industries for Ireland, submitted to the Chief Secretary by the Right Hon. Horace Plunkett, M.P., Chairman, on August 1st 1896, contains among other valuable reports the admirable paper by M. E. Tisserand referred to above. The Report of the Parliamentary Committee says: "M. Tisserand is universally acknowledged to be one of the first authorities in Europe on Agriculture and the administration of aid to agriculture by the State, and the French Ministry of Agriculture, of which he may be described as the permanent head, has been to a large degree shaped by his hand." The paper which was prepared at the request of the Committee contains "such advice as his unique experience would prompt him to offer on the constitution of a ministry of Agriculture". Although prepared for adoption under special conditions, it is a paper of such breadth of view and general importance that it ought to be consulted by every State, not omitting our own Government, which, it must be admitted, is very backward in the matter of aiding agriculture. Referring to the director or minister of agriculture M. Tisserand, in one part of this admirable report, says that "It means for the man who is placed at the head the obligation to study the needs of agriculture, to surround himself with the necessary assistants for the purpose, to cause the extent of the problem to be understood, to seek for practical solutions, to point them out to Government, and to see that they are adopted." And who does not wish to have such a head to direct agricultural education and improvement in Ceylon!

Arrangements have been made for a series of lectures to be delivered at the School of Agriculture. The first of the series, on Physical Exercise, was delivered by Dr. W. H. De Silva, M.B.C.M., on Tuesday, the 15th February, to a very appreciative audience.

Mr. G. W. Sturgess, Colonial Veterinary Surgeon, left for Bombay and Karachi by the "Laos" on the 14th February to bring over a supplementary stock of Sind cattle for the Government Dairy. A number of cows and calves drafted from the Dairy herd will be sold on the 4th of March next.

The final examination of the present Forestry class began on Tuesday, the 15th February, and lasted till Wednesday the 22nd idem, Mr. W. Ferguson, Asst. Conservator of Forests presiding. The Entrance Examination for the new class was held on the 14th and 15th February (when six candidates presented themselves) under the supervision of Mr. Gillam, Superintendent of the Forest Timber Depot, Colombo. The new term begins on March 1st.

Specimens of Ramie fibre lace made at the instance of the School of Agriculture by the scholars of the Kandy R. C. Convent, have been sent to London for an opinion.

We understand that two enterprising gentlemen are intending to start the extraction of Ramie fibre in Ceylon, one using the McDonald Boyle machine and another the Favier machine. The interest in Ramie fibre is gradually taking practical form.

COCHIN COCONUT OIL.

We are indebted to the Principal of the Madras College of Agriculture for the following note by Mr. Menon of the same institution.

"The name 'Cochin oil' in the London market denotes all coconut oil sent from the West Coast i.e., the 'Malabar Coast.' 'Cochin oil' does not mean exclusively oil from the Cochin State. As the port of Cochin from a very long time was the active centre of the coconut oil trade, the name 'Cochin oil' came into vogue in the London market for all coconut oils from the Malayalam side as distinguished from 'Colombo oil' for all coconut oil exported from the island of Ceylon. The process of manufacture is the same as in Ceylon. It struck me while I was in Colombo some years ago, that the harvests were too early, and that the coconuts were not fully matured. Of course we know from experience that immature coconuts give muddy oil. No doubt more attention is paid on the Malabar Coast to the curing of the kernel. In Colombo artificial methods are employed for drying coconuts before milling, whereas on the Malabar Coast they are naturally dried. During the heavy rains of the S.W. monsoon the nuts are preserved in elevated sheds and receive smoking. The good 'copra' of commerce is obtained thus. don't think the superiority of 'Cochin oil' is due to any superiority in the variety of the coconut tree. The Ceylon coconuts compare very favourably with the Malabar ones. Perhaps one main reason for the superiority of the 'Cochiu oil' might be found in the fact that throughout Malabar, Cochin and Travancore, coconut oil is an article of diet. Ghee is seldom used even by the wealthy. For all culinary purposes, even in the Royal families of Calicut, Cochin and Travancore, only coconut oil is used. This direct patronage by the aristocracy and the whole public must have greatly contributed towards the excellence of the oil. "The whole question requires a thorough investigation before any definite conclusion could be arrived at. I give what appears to me to be the probable causes. Mr. Drieberg's enquiries cover a vast area, and I am sorry I am unable to give more information at present."

Mr. Menon then furnishes a list of names of persons who may be consulted on the subject, and kindly adds, "if necessary, I shall prepare a few queries which might facilitate matters."

NOTES ON RINDERPEST.

I propose in these notes to give some idea of how rinderpest sometimes breaks out in the villages of the North-Central Province. There is a tendency among the villagers to hide the facts connected with the origin of an outbreak; but by enquiry I have found that most outbreaks can be traced to a certain extent. I shall give a few examples to illustrate this,

There was an outbreak at Onegama, a Moorish village situated ten miles east of Polonnaruwa in Tamankaduwa District. At first I was not able to find out how the disease was introduced, as I could not have got any clue as to its origin. But I was able to ascertain the facts in a neighbouring village. Some of the draught buffaloes in Onegama had been lent for paddy-field work in the Eastern Province. Shortly after they were lent, rinderpest broke out in that part of the Eastern Province where these cattle were working. The owners hearing of the outbreak went and brought back their buffaloes to Onegama in order to protect them from the disease. But soon after they reached the village it was found that they had already caught the contagion, and from them the disease spread throughout the village.

Again, at Bulankulam, a village situated a few miles north of Maradankadawela, and about a mile from the Matala road, a serious outbreak of the disease took place lately. It was brought to my notice about a month after it began, and the Velvidane of the village, whose cattle were the first to be attacked, bitterly complained that he had lost almost all his cattle. Questioned as to the origin of the outbreak, he said he was utterly ignorant of it; nor could I elicit any information about it from any other resident in that village. But subsequently I heard in another village that the Velvidane himself had introduced the disease unawares, and it came about in this wise:

One day while out in the jungle he found the carcase of a coast bullock lying there. Its long tapering, polished horns looked very attractive, and the Velvidane removed them and fixed them in the calf shed. A few days afterwards one of the calves got ill and died. In a short time another calf died, and then another took ill. The Velvidane noticing his calves getting ill and dying in rapid succession, suspected that some one had "done *hoonium*" to them by invoking an evil demon against them, and consulted the deity in a temple close by. The deity, through its spokesman, confirmed the man's suspicion, and suggested some medicine in which the dung of the ass was one of the ingredients! The medicine, however, was of little avail, and from the calves the disease spread to the older cattle. It was not until several of the cattle were attacked that the Velvidane suspected the disease was rinderpest. Of course he tried to keep the history of the pair of horns and the fact of the outbreak as secret as possible; and it was after the disease had spread throughout the neighbouring village of Amune that it was noticed by the higher headmen.

In another instance which took place near Kalawewa the disease originated from some infected hides which happened to be placed in the loft of a cow shed. On a wet day the shed began to leak, and drops of rain fell on the hides and trickled down to the place where the cows were tied. So these were attacked first, and from them the disease spread to the other cattle in the village.

The question whether rinderpest is enzootic in Ceylon is very important in connection with the prevention and suppression of the disease. It is difficult to prove that it is enzootic, for one must be able to show that all sources of mediate

as well as immediate contagion have been absent before asserting that it is enzootic. It is the experience of the oldest men living in this Province that rinderpest was very uncommon here before the opening of roads, and they believe it is introduced by cattle newly brought from India.

Even supposing the disease is enzootic it is clear that it is at times introduced afresh by infected cattle from India driven across the Province. A strict watch should, therefore, be kept on such cattle; and they should be carefully examined both while landing and at certain stations along the course of their journey. Any found attacked with rinderpest should be destroyed and the rest quarantined; and in this connexion it must be noted that the importation of several hundreds in one herd is objectionable, as they cannot be managed in case an epizootic breaks out among them.

E. T. HOOLE.

Anuradhapura, 24th January, 1898.

THE EFFECT OF DIFFERENT MANURES ON THE QUALITY OF PRODUCE.

In the *Ceylon Observer* of December 20th last is published a press "interview" with Mr. A. Baur who has lately established manure works in Ceylon. In this interview we find the following statement:—"Mr. Hughes, in whose judgment must be placed the greatest value, expressing the opinion that no blood, raw bones, or fish should be used, as strong-smelling substances taint the value of tea." Mr. Hughes, who is here referred to, is the well-known Agricultural Chemist who has in a great measure identified himself with the tea industry in Ceylon, and it will be seen that his remarks with reference to the effect of manures on the quality of the crop have special reference to the tea plant, the flavour of the produce of which is so important a factor in its market value. On reading the opinion quoted above, one is at first naturally inclined to consider it rather a sweeping statement, as altogether prohibiting the use of so well-established and valuable a fertilizer as blood, and a subsequent explanation offered by Mr. Baur himself in the *Observer* of December 23rd, comes as a sort of relief. In this statement Mr. Baur says: "With reference to your comments on the question of the tainting of the flavour of tea by the application of strong-smelling manures like blood or fish, it would read as if the chief argument of Mr. Hughes against their use was in this direction, whilst on the contrary the principal objection against them, and raw bones, was on the grounds of the risk of their introducing some fungoid disease." From this explanation we may infer that Mr. Hughes did in some measure object to the use of the manures referred to, on the score of their tainting the flavour of tea (but to what extent we are not told), if we are warranted in inferring even this much. Under the circumstances we are inclined to think it most advisable that the question of the tainting of tea by strong-smelling manures should be submitted to Mr. Hughes for special opinion.

Mr. Baur also states, in the explanation referred to, that "as a practical demonstration one of the leading agronomists of France submitted to me samples of wine from a vineyard which had been manured with a strong-smelling fertilizer, and the flavour of which had been distinctly affected, while the wine from the unmanured plot of the same vineyard was all right." We do not know whether we should infer that the wine reproduced in its flavour the corresponding objectionable smell of the manure, but we may at least conclude that the flavour of the grapes was materially impaired,—and to that extent had its market value depressed—which is serious enough. We have heard it said that vegetables manured with foecal matter at the Straits, emit "when they are cold" a distinct odour of the foul fertilizer employed, and that the flavour or aroma of tobacco is appreciably affected by *buffalo* manure, which is, therefore, avoided by growers of the fragrant weed. The manuring of the betel-vine, it is well known, calls for the greatest caution.

All these opinions and experiences may have an important bearing on the question of economic manuring, and for that reason it should be ascertained whether there is sufficient grounds for believing that the peculiar compounds which impart special odours to manurial agents are, as such, absorbed by plants, retained in the cells of existing tissues, and even transmitted to new-formed organs such as the fruit.

Agricultural Chemistry tells us that plants partake, so to speak, of a regular diet of necessary plant food, the ingredients of which may, of course, be absorbed in greater or less proportion according to the species or variety of the plant; it also allows that they are able, to a certain extent, to take up useless and deleterious substances found in the soil, and thereby to do even fatal injury to themselves. Prof. Warrington says that "The roots take up apparently all diffusible substances which are present in the water which they draw up from the soil."

Are we then warranted in assuming that the roots of plants are capable of absorbing solutions of strong-smelling compounds, as such, together with their normal food ingredients, and reproducing a correspondingly objectionable flavour in their structures, whether leaf or fruit?

Referring to Prof. Warrington again, we learn that "a plant is capable of making use of nitrogen in the form of nitric acid or ammonia; it also, according to various experimenters, is able to assimilate nitrogen in the form of urea, uric, and hippuric acids and several other amide bodies. The facility, however, with which ammonia and other nitrogenous substances are converted into nitric acid in the soil is so great, that nitrates become by far the most important source of nitrogen at the plants' disposal. Could it be, then, that such compounds as urea as well as organic nitrogenous acids found in, or produced by the decay of, organic substances,—and yet to be decomposed into their ultimate constituents (ammonia, carbonic acid and water)—are instrumental in producing the objectionable flavours due, as is alleged, to the use of animal fertilizers?"

That organic manures do produce distinct results, as regards quality of produce, is borne out by a report on "The Fertilization of the Soil as

affecting the Orange in Health and Disease," made to the Department of Agriculture, United States, by Mr. H. J. Webber:—

"The nitrogen used in fertilization," says Mr. Webber, "is derived from mineral or organic sources. Of the former sulphate of ammonia and nitrate of soda are the forms most used; of the latter, muck, dried blood, blood and bone, cotton seed meal, tankage, fish scrap, stable manure, &c. are the forms most commonly employed. Barn manure is largely used by many growers who hold that chemical manures are injurious to plants." The most important conclusions that are to be drawn from Mr. Webber's report are thus summarized:—

(1) By a proper combination of the various elements used in fertilization one can undoubtedly largely govern the quality and flavour of the fruit.

(2) To obtain a fruit with thin rind, use nitrogen from inorganic sources in moderate quantities, with considerable potash and lime.

(3) To sweeten the fruit, use sulphate of ammonia in considerable abundance, decreasing the amount of potash.

(4) To render the fruit more acid, increase the amount of potash and use nitrogen from organic sources.

(5) If it be desired to increase the size of the fruit, as is sometimes the case, apply a comparatively heavy dressing of nitrogen in some organic form, and slightly decrease the other elements. In the case of the Tangerine and mandarin, where a larger size is usually desired, a heavy dressing of nitrogen fertilizers would favour this end and is not objectionable unless carried to excess.

(6) Fertilization has an important bearing on disease.

(7) "Die-back," a serious malady, is in all probability the result of over-feeding with nitrogenous manures from organic sources. These manures, if used at all, should be used with great caution.

(8) Foot-rot, although not primarily due to improper methods of fertilization, is no doubt considerably influenced by this cause.

(9) Insect diseases are also apparently influenced by the use of fertilizers, organic manures rendering the trees more liable to injury from this source than chemical fertilizers.

Mr. Walter Scott Campbell, of the Agricultural Department of New South Wales, commenting on Mr. Webber's reports, gives it as his opinion that many of the differences in the results of manuring with different fertilizers are to be attributed to the character of the soil. He points out that the orange soils of Florida, the scene of Mr. Webber's experiments, are sandy and sterile. He speaks to having seen both good and bad results of organic manuring. He specially mentions volcanic soils, and believes that in them organic manures will be advantageous, particularly green-manures such as the cow-pea. Mr. Campbell makes special reference to the action of organic manures in improving the texture of the soil, and the good effects traceable to their power of liberating unavailable plant food during their decomposition.

Some cultivators give it as their experience that some plants are better able to deal with bulky and organic manures than others; the former, for this reason, being referred to as "gross feeders."

We have written enough, we think, to indicate the need there is for special research into the subject of

manures, their action on the quality, and especially the flavour of produce, the relation of different manures to soils of different characters, and to the nature of the climate, particularly temperature and rainfall. All these are questions for the Agricultural Chemist to study *on the spot*, and it will be to the advantage of the agriculturist as well as the manure merchant to see that they are solved by a competent authority. It will not do for any one to dogmatise in the face of the many apparently paradoxical facts that have to be carefully considered, and as carefully worked out in practice, before he can attempt to offer an opinion on so complicated a question. It is enough for us to remember what has been already hinted at, viz., that the action of a manure depends not only on its own inherent qualities, but on the soil, the conditions of temperature and rainfall, as well as the character of the plant to which it is to be applied.

POTASH AND ITS FUNCTIONS IN AGRICULTURE.

The following is a brief summary of an exhaustive paper on the above subject by the Chief of the Division of Chemistry in the United States Department of Agriculture:—

1. The potash used in fertilizers and found in the soil has been derived from the decay of minerals containing it as an ingredient, and chiefly from feldspars.
2. During the progress of weathering, a portion of the potash in original rocks becomes soluble and is lost by lixiviation. As a rule, about 25 per cent of the potash finds its way by this means into the streams and seas.
3. There is usually a less percentage of potash in the finer particles of soil than in the coarser particles, and this is due to the fact that the solvent action of water is more strongly exerted upon the finer particles.
4. The potash is quite evenly distributed both in the soil and subsoil, there being only a slightly greater proportion in the deeper layers, doubtless to the fact that they have not been so thoroughly leached.
5. The solubility of potash in the soil is very different for different solvents, the least for the weak organic acids and greatest for the strong mineral acids. Hot hydrochloric acid extracts from the soil about 20 per cent of its total potash content, which is about thirty-two times as much as is removed by a 1 per cent citric acid solution.
6. A fertile virgin soil contains about 2 per cent of total potash, or about 70,000 pounds per acre taken to the depth of 1 foot. A crop removing 50 pounds of potash a year could be grown consecutively for about one thousand four hundred years on such a soil before exhausting all the potash which it contains.
7. The soil retains a certain quantity of fertilizing material with such tenacity as to render it practically impossible for plants to withdraw the whole of it, thus protecting the future against the rapacity of the present.
8. The quantity of potash removed by various crops per annum varies greatly. The largest quantities are removed by beets, and the smallest

quantities by cereals and cotton. Beets may remove as much as 100 pounds per acre, cereals about 30 pounds, and cotton about 23 pounds for the average crops as produced in this country. In Germany, beets grown for forage remove often over 200 pounds of potash per acre from the soil, clover hay about 74 pounds, and tobacco the same quantity.

9. Tobacco contains a larger proportion of potash than any other common crop, viz., about 40 parts per thousand of the dry leaves. Forage beets contain 35, potatoes 20, sugar beets 18, clover hay 19, beans 13, and cereals 5 parts per thousand.

10. There is about four times as much potash in the straw of cereals as in the grains, while in peas and beans the proportion is about as two to one.

11. A soil which yields about 0.01 per cent of potash to a 1 per cent citric acid solution, and contains about 0.30 per cent soluble in hydrochloric acid does not usually need a potash fertilizer.

12. The potash salts which supply the commercial potash fertilizers of the world have been deposited as the result of the evaporation of saline lakes charged with potassic materials.

13. The commercial potash of the world is derived almost exclusively from the neighbourhood of Stassfurt, in Germany. The quantity of crude salts annually mined is about three-quarters of a million tons, worth nearly three million dollars.

14. The high-grade commercial salts used for fertilizing purposes are manufactured from the crude salts, and are to be preferred when shipments are made to great distances and at high rates of freight.

15. The principal crude potash salts used for fertilizing purposes are kainite containing 12.5 per cent of potash, and carnallite containing 9.9 per cent.

16. Tobacco waste, cotton seed hulls, and wood ashes also furnish important quantities of potash for fertilizing purposes.

17. Recovered marsh or swamp lands and lands containing large quantities of sand need, almost universally, potash fertilizer. The percentage of potash in soils usually rises with their content of clay.

18. The maximum effect from fertilization with potash is secured only when other plant foods are supplied in such a way as to make a well-balanced ration, and where proper methods of culture are employed.

19. Lime is an important adjunct to potash fertilization, and, as a rule, should be added to a soil in large quantities wherever potash is applied.

20. The best kind of potash fertilizer is determined by local conditions, freights, and the nature of the soil and the crop. Fertilizers containing considerable quantities of chlorine should never be applied to vineyards and tobacco fields.

21. In intensive pot or garden culture, where highly-concentrated plant foods are desired, and where the cost of the fertilizer is unimportant, potash may be applied in the form of phosphate or nitrate.

22. In some soil potash salts, in common with other saline bodies, produce injurious effects by reason of their hygroscopic nature, attracting moisture, and, on drying, producing a cementation of the soil, which renders it impervious to water and impenetrable by the rootlets of plants.

23. Crude potash salts can be applied with benefit in the preservation of stall manure, but their value for this purpose is perhaps over-estimated.

24. Potash fertilizers should, as a rule, be applied in the autumn, or at least from two to four weeks before planting, and should be thoroughly worked into the deeper part of the soil in order to come into contact with the rootlets of the plant.

25. The germination of seeds, especially if they have a low vitality, is retarded by bringing them into direct contact with potash salts.

26. The application of crude potash salts to a soil which is not easily cemented may be useful during a dry season by reason of their power of attracting and holding moisture.

27. Potash salts favor the decomposition of mineral particles in the soil, and thus tend to add to the stores of plant food therein.

28. The application of crude potash salts to the soil tends to protect the crop from frosts by preventing the too rapid evaporation of moisture and by producing a more luxuriant foliage.

29. The too abundant application of potash to the soil may become injurious by reason of the retardation of the process of nitrification which it produces.

30. Crude potash salts, especially kainite, when added abundantly to a soil, are said to act, to a certain extent, as an insecticide or a preventive of disease, and when mixed with stable manure act as a preservative by checking the activity of the denitrifying ferments.

31. It is impracticable to give formulas for the preparation of fertilizers containing potash, since both the quantity of potash to be used and the form in which it should be applied are determined by local conditions, which cannot be taken into account in the preparation of directions for the use of fertilizers.

TEAT TROUBLES.

It is sometimes found that cows have naturally malformed or imperforated teats. In such cases the gland, of course, enlarges, but there is no exit for the milk and inflammation results from its retention. In some instances an incision at the end of the teat may open a partially developed duct from which the milk may be drawn off by a tube or syphon, but usually abscesses form and the curdled and decomposed milk is thrown off with the pus. Cows with congenital defects such as malformed and imperforated teats, and, as some times found, without any teats at all should not be bred with.

Warts on the teats, especially of heifers, are a common source of trouble to the milker, rendering the animal difficult to milk owing to the soreness occasioned by the regular friction twice a day, and occasionally, when growing on the end of the teat, causing occlusion of the duct. This leads to retention, and, in its turn, to mammitis in more or less severe form. The cause of these circumscribed growths is a moot point. Some associate them with dirt, others with what has been called a warty diathesis, but the tendency is now to regard them as the work of a specific organism. Dirt may be favourable to its development, but we certainly frequently

meet with animals growing warts the cleanliness of whose skins leaves very little to be desired.

It is sometimes found that after the animal has calved the warts disappear as mysteriously as they appeared, but the worst of waiting and hoping is that should they persist they become sore from friction, while the treatment is more difficult than when the animal is dry. Interference after calving necessarily occasions even more soreness than friction by the hand in milking, and it is generally better to take steps for the removal of warts in good time, so that the teats may become perfectly healed and the skin hard before regular milking becomes a necessity. Soreness of the teats from any cause invariably causes great difficulty in getting the animal to stand quietly, and where it does not lay the foundation of kicking or viciousness, it may lead to the retention of the milk. The method of removal depends largely on the nature of the growth. An excrescence on the point of the teat, or any case where the attachment is by a narrow neck, is best removed by ligature, *i.e.*, tying it tightly round the base with a waxed thread or piece of suture silk, so that the supply of blood by which it is nourished is cut off, when, as the result of the strangulation, it dies and drops off.

In most cases, however, of warts on the teats they are very numerous, and have their bases so diffuse that a ligature is out of the question. Some heifers have their teats, and in some cases portions of the mammary gland, so completely covered with small excrescences, popularly known as "seed" warts, that nothing can be done for their destruction except the application of caustic agents.

A remedy of this class, specially applicable to warts on the teats, and growths too small to ligature, is a formula introduced some time ago by M. Bondeaud. It consists of—Arsenious acid, powdered gum arabic, and powdered savin, of each 10 parts; simple cerate 36 parts. This when made semi-fluid by heat forms a very adhesive application. It should be spread over the surface of the warts, carefully avoiding the skin, by means of a camel-hair pencil. Another formula, to be employed in the same way, is—Corrosive sublimate, 1 part; castor-oil collodion, 30 parts.

Soreness of the teats from erythema can be best prevented by carefulness in milking, and drying them so as to avoid chaps and cracks. The benzoated ointment of oxide of zinc is a useful application, or, as an alternative, the glycerine of carbolic acid may be tried. Once they become sore the necessity for regular milking interferes so greatly with healing that it is much better to use every endeavour to prevent the trouble than to cure it.

Wounds of the teats are not uncommon, indeed are met with increasing frequency since the introduction of barbed wire. Those of a superficial character require treatment similar to soreness of the teats, *viz.*, careful milking, or the use of the teat-syphon for the removal of the secretion, in order to interfere as little as possible with repair, and mild astringent dressings to facilitate drying up of the sore. Wounds that tear or penetrate the substance of the teat and establish an opening into the duct are much more serious. A fistulous opening is then established, from which the milk squirts in a powerful stream when the teats are

manipulated, and the opening is by this means effectually prevented from healing. Little or nothing can be done while the cow remains in milk, but the repair of such an injury is not beyond the skill of the surgeon after she has been dried off. Occasionally, however, interference with a fistulous opening will cause inflammation of the lining membrane of the duct, which may lead to its thickening or occlusion, and as it is better to have two holes in a teat than none at all, it should be seriously considered whether the benefit likely to result is worth the risk.

Occlusion of the duct and obstructions in the passage are by no means rare. For cases of stricture or thickening, occurring as a complication of mammitis or resulting from inflammation of the lining membrane of the duct set up as suggested above, there is nothing that can be done to give relief except the frequent passage of probes or syphons of gradually increasing size.

Obstructions to the free flow of milk, other than stricture, consist either of small growths attached to the lining membrane or of lacteal calculi or milk-stones. Small tumours attached by pedicles to the membrane may be felt to block the passage as the teat is manipulated with the hand. They are difficult of removal; in fact, it can only be accomplished with a specially designed instrument. Masses of curdled milk or lacteal calculi, to be felt as nodules along the course of the duct, can sometimes be extracted, but the usual plan is to push them back into the galactophorous sinuses, where they sometimes remain. A quill, or wing-feather of some bird, is generally the rough substitute for a probe employed, but in every place where cows are kept, proper silver-plated teat tubes or milk-syphons should be kept for use as required. As all impediments to the free flow of milk tend to cause mammitis, garget or indurated udders, from retention of the milk, every care should be taken to overcome obstructions, and that all the milk is obtained in spite of the difficulty or the longer time occupied in stripping the udder.

Relaxation is a teat trouble of a different order to those we have been considering, since in this case a free flow takes place resulting in more or less loss of milk. The original cause is generally over-distension, giving rise to a weakness of the sphincter or ring-like muscle by which the milk is normally retained, but in some cases there may be a natural weakness. The milk either drips away as the cow stands, or squirts out in a forcible stream as the animal moves, and the distended bag is pressed by the thighs. Narrow-built animals with well-developed udders waste most when the sphincters are weak, but as a rule the loss is less than is supposed, since a little milk, like a little blood, makes a much bigger show on the ground than it does in a pail. There is nothing can be done in these cases but to replace the weakened muscle by an artificial sphincter in the shape of a rubber ring, designed to fit with sufficient accuracy to close the passage but not to strangle the teat. Here lies the difficulty, since if the ring does not compress the teat tight enough to close the duct it is useless, while if it is tight enough to cause constriction it will cut into the teat substance and cause soreness, or by interfering with the blood-supply cause it to atrophy

just as we cut off a wart by ligature. The best way out of the difficulty is to set the cow that wastes her milk to rear calves, who will see that the udder does not become over-distended, and when she is too stale for this business, to dry her off, and fatten her out.—*M.R.C.V.S. in Mark Lane Express Almanac.*

GENERAL ITEMS.

According to Mr. McJanet's well-known tables, the live weight of cattle is to the deadweight as 7 is to 4, or the deadweight is $\frac{4}{7}$ of the live weight. Thus the carcase of an animal when live weight is 7 cwt. with weight 4 cwt.

The *Australian Tropical Agriculturist* for January publishes the 4th prize essay on the slaughter of cattle. We have already reprinted one of the most instructive of these essays, and do not therefore consider it necessary to reproduce the latest one in extenso, though the subject is of local interest. The writer of the present paper (J. Lindsay) mentions that the old theory of starving cattle for longer or shorter periods before killing, is now quite exploded, and all practical men agree that the better the animal is treated in the matter of rest, food and water, the more wholesome will be the meat. For oxen, the writer considers the pole-axe the most efficient and humane means of slaughter, far preferable to "Greener's" system. The most humane method of killing calves is said to be by stunning them with a mallet and then inserting a small knife at the back of the neck and severing the spinal cord, thus destroying all sense of feeling; the head, being immediately severed, is preserved in good and saleable condition. The practice of bleeding calves is nearly or quite discarded, as it is now generally held that the colour of the flesh depends entirely on the feeding. In slaughtering sheep the best is the method in vogue of inserting a sharp-pointed knife just behind the jawbone and quickly severing the spinal cord.

Pea-nuts or ground-nuts are now recommended as a cure for consumption. The *Journal of Hygiene* states that Dr. Brewer's treatment of consumptives consists of inhaling the fumes of vinegar and the eating of pea-nuts. He gives his patients as many pea-nuts as they can eat without injuring their digestive organs. Two young ladies, who had been the rounds of the doctors and taken cod-liver oil and tonics till they were nearly dead, were put on his treatment and recovered. Concerning these cases Dr. Brewer says:—"I now commenced feeding pea-nuts. One would think this a very indigestive diet, but they craved them, and it has always been my policy to find out what my patients desire to eat, and unless it is too unreasonable I humour them. Both young ladies have become quite plump, and after a year's inhalation have ceased coughing, and I pronounced them well. The pea-nut was long known as an excellent fat producer, and much more agreeable than rancid shark-oil that oftentimes is sold for cod-liver oil. While not all can digest pea-nuts, a great many, even with feeble digestion, eat them without discomfort."

CHAS. S. HADDEN.

“ PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”*

(Second Series.)

CHARLES S., & FREDERICK J., HADDEN :

PIONEER PLANTERS AND PROPRIETORS, FROM 1840 ONWARDS.

any of the early estate proprietors deserve to be commemorated among the Pioneers of the Ceylon Planting Industry, they are certainly the two gentlemen whose names stand at the head of our page on this occasion. Coming out

as very young men, the Messrs. Hadden (cousins) brought capital as well as energy and intelligence to the work before them. They did not spare themselves in the roughing which appertained to the life of the pioneer in those very early days, and nearly 58 years have elapsed since they landed at Colombo, they being among the very first to travel out to Ceylon by the so-called “overland” route. Mr. Frederick Hadden is no longer with us though well represented in the Island by his sons. Mr. Charles S. Hadden—who, we are glad to say still survives with plenty of life and energy to devote to the duties of the country squire in England,—was only 20 years of age when he landed at Colombo, and he is now in his 79th year, having been born on X'mas Day 1819, the same year though seven months after Her Most Gracious Majesty the Queen.

Let us now turn to the narrative of their trip out to, and early days in Ceylon:—Frederick Hadden and Charles Stanton Hadden (cousins) left London together for Ceylon in August, 1840, travelling through France to Marseilles, by French Steamer to Alexandria, by Nile boat to Cairo, to Suez on donkeys and to Bombay in the E. I. Coy.'s Gunboat “Zenobia.” From Suez to Aden and Bombay a terrible voyage it was in this wretched old paddle steamer of 300 tons. The officers on board were allowed to receive £50 from each passenger and provide bed and board (7 passengers only). The steamer was said to have been employed in conveying pigs and cattle from Ireland to Liverpool before she was purchased by the East India Co. for a gunboat. *Rats swarmed* on board of her. When the “Zenobia” steam gunboat made Bombay, the food on board was almost exhausted, there were a few fowls left alive in the coops which were under the seats round the quarter-deck, not more than five or six remained, and *not one* of them had all the toes remaining, for they had been eaten off by the rats, which attacked them in the night! Mr. Hadden has often feared to relate this (though it is positively *true*) since many think it to be a bit of romancing. The machinery broke down twice on the voyage to Bombay which occupied three weeks. Four of the European crew were kept in irons on the quarter-deck all the time, and two officers were under arrest in their cabins. Our pioneers remained six weeks in Bombay with Mr. Alexander Hadden, a brother of Mr. C. Hadden and then on to Colombo on board the good old teak-built sailing ship “Recovery.” The young gentlemen landed at Colombo on 1st or 2nd November, 1840; they had letters of introduction to the Hon. Geo. Turnour, then acting Colonial Secretary. He advised the Messrs. Hadden to buy land in the Ambagama

*We have to apologise for interruptions in the monthly publication of our series of “Pioneers” caused by extra work in “bookmaking” in other directions. During the rest of 1898 we hope to continue the series at bi-monthly intervals, and among the Pioneers whose portraits and memoirs, or notices, are being arranged for are the Messrs. Frank and Wm. Sabonadiere, Mr. John Capper, Mr. C. Tottenham and Mr. Wm. Bowden Smith, all of whom had to do with the development of the Colony in diverse ways, and are fairly entitled to be enrolled among our pioneers.—ED. “T. A.”

District, because all the Government Civil Servants had secured land there, and the first of the new roads to be opened would be the one from Gampola to Yatiyantotte through Ambegamuwa village. Mr. Wm. Hall, surveyor, had just cut the boundaries of a block of forest, of over 1000 acres, and offered to hand over his claim to them on receiving 1s. per acre commission. The Messrs. Hadden accepted this offer, and, as at that time it was considered dishonourable to bid at the auction against any one who had been at the expense of cutting boundaries, they obtained this land at the upset price of 5s. per acre. They at once set to work to cultivate it, and a very rough time they had of it; the land was situated beyond Carolina Estate towards Adam's Peak; there was not even a bridle-road to it beyond Gampola, and all supplies and rice for coolies had to be carried over 30 miles of jungle road, at that time one of the worst in Ceylon. After working hard for twelve months (which was well earned experience) the Messrs. Hadden wisely and fortunately concluded that Ambegamuwa was the worst district in Ceylon for coffee, and so they decided to abandon the place although they had spent £1,500 upon it: a serious loss out of the available capital, for money was not so plentiful in those old days. Luckily a small estate "Algooltenne," (or "Weygalla" as the Messrs. Hadden preferred to call it) was advertised for sale in the *Observer*, of the extent of about 230 acres, only 30 acres planted with coffee, adjoining Mr. Tindal's fine property under Hunasgeriya Peak, at that time managed by Mr. Austin. Having occasionally visited that gentleman, and being much impressed with the Hunasgeriya fine soil, and the splendid young coffee plants growing there, the Messrs. Hadden resolved to purchase Weygalla, and this Mr. C. S. Hadden, always considered, turned out to be the best paying estate in Ceylon.

From the day of their entrance into Hunasgeriya district, the success of the Messrs. Hadden was secured. By the spring of 1845 the crops from Weygalla (the first sold for 124s per cwt) had returned to the Messrs. Hadden every penny of capital they had spent since leaving London. We have heard that their neighbours in Ambegamuwa called the young Pioneers, "a couple of fools" at the time they abandoned that district; but the majority of those, they left behind, came to ruin, several were proclaimed bankrupt, and so the Messrs. Hadden might then have asked "Who were the fools"?

On the 30th June, 1845, a fine block of forest land was sold by auction in Colombo situated on the Hunasgeriya range, only three miles from Weygalla, belonging to Mr. Fraser of Arbuthnot & Co., Madras. It was divided into four lots of about 250 acres each. The cousins examined this

land thoroughly, and thought it such fine old forest with splendid soil, that they resolved to attend the auction, and bid for the best three lots. These were knocked down to them at £5 per acre, a price at that time considered enormous, as good forest was still to be bought at 5s per acre! But the Messrs. Hadden knew the value of the land, and at once opened three new Coffee Estates of 200 acres each, called "Hunugalla," "Halgalla," and "Horogalla," all of which returned a profit to their fortunate owners, year by year, for *forty years*.

Mr. Frederick Hadden left Ceylon for good in 1850, and Mr. C. S. Hadden in 1852, by which time all stores and buildings were completed, leaving Mr. Peter Moir in charge of all the properties* with his brother Mr. James Moir to assist him. Two more sensible, honest, and hard-working Scotchmen never landed in Ceylon. Under their charge the estates continued to flourish until the Coffee became unable to fight such dire enemies as "Leaf disease" "and Green Bug."

The land abandoned in Ambegamuwa was never revisited by either of the Messrs. Hadden after the day they gave it up; but it was divided into five lots by Mr. James F. Moir and put up to auction in Colombo on 30th Sept., 1874, at 1 p.m. On that day Mr. C. S. Hadden was out partridge shooting on his property in Herts, and remarked to a friend while taking luncheon under a hedge, that he had a property selling about that time in Ceylon, and expected to receive a telegram giving the result. On the morrow on returning home from shooting at 4 o'clock, the telegram was already on his table saying that all the lots were sold at a price which returned all the capital they had expended on the place. Benachie and surrounding estates in Lower Dikoya were formed out of this group of lots. Had they at once been put in tea, as we among others urged at the time, their owners would have scored; but most of the land went into coffee and did not pay for years until tea took its place.

* The late Mr. Tytler was fond of telling the story of Peter Moir's selection as their responsible Manager by the Messrs. Hadden. How he (P.M.) and some other young men came out for an employer whose engagement was far from a fair one considering the times, and moreover as signed in London, it was not binding in Ceylon—and so two of the young men broke through it in a few months and speedily got employment at double the salary. Peter Moir no more considered he was fairly dealt with than the others; but he had signed his agreement, pledged his word, and no power on earth would make him break it. He was called a "softie," a "spoon," &c., until on the very day of his agreement expiring, he had the offer from Mr. Chas. Hadden, of a post and salary that placed him far before his old companions (who never greatly prospered we believe), while he had established for himself the most valuable thing in the world, a CHARACTER which made him esteemed beyond most men right through the Colony, and which he never forfeited till the day of his death in the old country. Succeeding generations of planters came to hear of Peter Moir as the man whose word was as good as his bond.

Kotiyagalla in Bogawantalawa was purchased for the Messrs. Hadden by Mr. Moir in the year 1872. It was never a great success in coffee, or at any rate never approached the Hunasgeriya Estates; but it did, and is doing, well in tea. Mr. Fred. Hadden, senr., died on 22nd April, 1882, thus terminating a partnership made with his cousin in 1840, during the whole of which time they remained on the most affectionate terms. Soon after, it was arranged that Messrs. Fred. & Frank J. Hadden, sons of Mr. F. Hadden, senr., should become sole proprietors of the Hunasgeriya Estates, and that Mr. C. S. Hadden should become sole owner of the fine Kotiyagalla property, of which his nephew and son-in-law Mr. Frederick Hadden became chief manager. Kotiyagalla contains 1,080 acres of rich land, about three-fourths of which are under fine tea, the soil, climate and soil being all conducive to a fine high-priced product. Later on Mr. Frank J. Hadden became sole proprietor of Hunugalla and Weygalla and, lately, he sold the latter with 344 acres to Mr. E. G. Beilby, retaining Hunugalla—770 acres with 400 doing well in tea—in his own hands.

We ought to mention, too, the close business connection between the Messrs. Hadden & Co. and the well-known Fenchurch Street Firm, Messrs. James A. Hadden & Co., of which their relative Mr. Alex. Brooke is the esteemed managing partner.

We may here give "a leaf from the past" kindly supplied to us without Mr. Hadden's knowledge by one well-acquainted with his family in the early days:—"I know not if you realise how Mr. Chas. S. Hadden links us with the eighteenth century. His father took an active part against the rioting then so rife and his commission dating back to the time when Kings of England still claimed to be Kings of France, is so signed by George III. That nonsense was not dropped until the Union with Ireland in 1801. There are not many now alive whose father's commissions were signed by a King of England, of Scotland, and of France!

"The old yeomanry officer had the freedom of Nottingham conferred on him in 1795. See enclosed cutting from a Nottingham journal. The Colonel Seely there is son of 'Seely's pigs' if you are old enough to remember them: The writer of the letter, Fellows, is author of a History of Nottingham Yeomanry Cavalry."

THE FREEDOM OF THE TOWN.

TO THE EDITOR OF THE NOTTINGHAM DAILY GUARDIAN.

Sir,—I notice in your paper of to-day, in the report of Mr. McCrath's speech in the Council respecting the honour that is to be conferred on Col. Seely in reference to the freedom of the town, that he says the honour "would be increased to those who followed after by the fact that the first name on the list would be that of Mr. Seely himself." In the

"Nottingham Date-book," 1st September, 1795, it recorded that the commissioned officers of the 12th Regiment of Light Dragoons—Lieut. Middleton and Cornet Hadden, of the Yeomanry Cavalry—were presented by the Corporation with the freedom of the town, as an acknowledgment of their meritorious exertions in quelling riots. It would appear, therefore, that conferring the freedom of the town by the Corporation is not unprecedented.—I am sir, &c.,

GEORGE FELLOWS.

Beeston Fields, Nottingham, May 7th, 1895.

In conclusion we heartily congratulate one of the earliest, most intelligent and persevering of the Planting Pioneers of Ceylon on his long and honorable connection with the Colony. We have given but the briefest outline of the actual jungle work of Messrs. Fredk. and C. S. Hadden. It will be observed that they stuck to their posts all through the financial crash of 1845-47 when coffee and Ceylon were supposed to be ruined. The senior Mr. F. Hadden, now deceased, gave ten years' continuous hard work to the development of the plantations before ever taking a holiday; while Mr. C. S. Hadden had twelve years for his share. No one of recent years can picture what life and work in the hill-country of Ceylon was like in the "Forties," and more especially what roughing in the wilds of Ambegamuwa—in one of the very wettest divisions in the island—was like in 1841-2. We remember hearing our late senior describe a visit he paid to Mr. Wm. Hall (the same who sold his interest to Messrs. Hadden) in Ambegamuwa in 1841, and how the rain got through their talipot hut, filled up their boots and gave him a cold which it took years to get rid of altogether! Scant supplies, there being no roads, and bridges and streams often unfordable, were recognised as a matter of course, while even the sun was rare visitor between May and December:—

Past five an' fifty busy years,
An' lo! the wondrous change;
Those Hills are now the white men's homes,
Which were the wild beasts' range.
And, mixing with the torrent's roar,
The steam-pipe's puff is heard;
While rattling round the roller goes,
As merry as a bird.

And few and scant their comforts were—
The leaders of that band—
Whose cosie cottages now rise,
Bright homesteads o'er the land;
So while for all that's still to do,
Ye strive with high resolve—
Let grateful thoughts, too, have their play
As ye THE PAST revolve.

All honour then to the men who laid the foundations of the prosperity of Ceylon as a plantation Colony. Very, very few are left to us who go back beyond the half-century in their experience, and among these none takes a more honorable position than the Messrs. Hadden who brought youth, intelligence, indefatigable energy and capital to their work in Ceylon; while more especially would we

offer our congratulations to Mr. Chas. S. Hadden whom we have known and esteemed since he began revisiting his properties here—so well-managed by his nephews—some twenty years ago. The very type and *beau-ideal* of country squire, of "a fine old English gentleman, all of the olden time," it is a credit to Ceylon that she can number among her early Planting Pioneers, one so hale and hearty as

CHARLES S. HADDEN OF KOTYAGALLA, BOGA-WANTALAWA, CEYLON; AND OF INGLESIDE, SUNNINGDALE, BERKS, ENGLAND.

Long may he survive for us to point to as one of the very first band of Proprietary Planters who invaded the Kandyan jungles in the early "forties," and who have made Ceylon what she is today; and long may the name of "HADDEN" through younger generations, continue to be honorably enrolled in the Proprietary and Managing lists of our Ceylon plantations.

TIMBER TREES OF THE SEYCHELLES ISLANDS.

REMARKS AND USES OF TIMBER.

Sideroxylon Species. "Capucin." A large growing tree. Timber hard, almost undestructible either in water or in the atmosphere, used for beams, wall plates, frames of wooden houses, verandah posts, piles, planks, shingles, spokes for wheels, &c.

Calophyllum inophyllum. "Takamaka" or "Tacamahaca." A large growing shady tree always found on the seashore. Trunk 4 feet in diameter. Timber tough, coarse grained, not easily worked, color reddish, used for boards, planks, beams, ship and boat building, masts. Cocoa-nut mills are dug out of the root end of the tree and excellent canoes "Pirogues" are made (hollowed) out of it. The exudation from the stem is the *Tacamahaca* resin of Commerce. Its seeds yield the bitter oil of India which is said to be worth £90 per ton. This oil has a great reputation in Polynesia and the East Indies as a liniment for rheumatisms, pains in the joints, and bruises, and its efficacy in these respects can hardly be exaggerated. The uses of the oil and resin are unknown in Seychelles.

Dipterocarpacee Species. "Bois de fer." This is a large lofty growing tree, often attaining a height of over 100 feet, with a trunk 40 to 70 feet to the first branch, and a diameter of from 4 to 6 feet. Has great repute for making canoes. Timber resembles Teak in color and grain, hard and durable, used in all parts of house-building, boats, &c. This is perhaps the most useful timber of the Seychelles Islands, for general purposes. When the tree is wounded there exudes an almost transparent resin which is exceedingly flammable, and was formerly used as incense.

Azalia bejuga "Gayac" or "Faux Gayac." Yields a very fine strong and durable timber. In color it is not unlike the last and is used for the same purposes. It is now very scarce, and few living trees exceed 8 inches in diameter.

Terminalia Badamia "Badamier." A large growing tree from which canoes are frequently made. Timber is generally used for boarding inside of houses, &c, will not bear wet and exposure to the atmosphere.

Inbricaria petiolaris. "Bois de Natte." A large and lofty growing tree, Trunk often attaining a height of 50 feet. It is now becoming very scarce. Timber used in all parts of house building, cabinet work, &c. It is dark colored, close and fine grained, hard and durable. It makes beautiful furniture and when well polished it almost rivals the finest Mahogany.

Gomphandra species. "Bois Maree." A middling sized tree, whose wood is used for boards and planks in house-building. The timber is of a dirty white color, and not very durable.

Wormia ferruginea. "Bois Rouge" Is an ordinary sized tree, Timber red colored, hard and durable, bears exposure well and is in great repute for flooring and roofing houses.

Peritertia littoralis. "Bois de Table." A large growing tree, not common. Timber used in house building, furniture, &c. It is close grained and dark colored, and its quality is excellent.

Rubiacee Species. "Bois Sandal" or "Sandal." A small tree, Trunk seldom exceeds a foot in diameter and 20 feet in height. Wood close grained, easily worked, polishes well, beautiful pale yellow color, used for ornamental work in the inside of houses, furniture, panelling, and occasionally boards, &c.

Campanospermum Zeylanicum "Bois Montagne." Occasionally attains large dimensions. Held in great repute for making canoes which are said to be very durable. Timber used in house, ship and boat building &c.

Casuarina Equisitifolia. "Filao" or "Cedre" In Seychelles this tree attains a gigantic size. In 1871 I saw one whose trunk was 150 feet in length and 6 feet in diameter at about 20 feet from the root, lying on the beach near St. Anne's Bay, Praslin. In 1874, I saw several trees of it, growing on the beach at Curieuse Bay, Praslin, that were 120 feet in height, and straight as arrows. They appeared to be comparatively young trees. Its timber is used in all parts of house building. It is close grained, and sinks in water when it is green. When kept dry it is very durable, but decays quickly when exposed to moisture. It is nearly impossible to draw nails out of it. It makes excellent firewood and burns freely even when green. It is indigenous to these Islands and grows readily from seed which may fall on cleared ground.—J. HORNE, *Sub-Director*.

CINNAMOMUM TAMALA.

The Director of the Department of Land Records and Agriculture in Assam on the 22nd April 1895 forwarded some specimens of Tej-pat leaves for identification. In the letter accompanying the sample it was said that the tree yielding the leaves was largely grown in the Jaintia district for the sake of the leaves which were used as condiment. The leaves belonged to Cinnamomum Tamala, and on their being referred to Dr. Prain of the Royal Botanic Garden, Sibpur, he pronounced them to be those of the variety intermedium.

The use of Cinnamon leaves in India has been known for centuries. At one time, as *Folia Malabathri* or *Folia Indi*, the leaves of certain Indian species of Cinnamomum were employed in European medicine, but now they have become obsolete.

The information we possess on the subject of Tej-pat as recorded in works on materia medica is very fragmentary, but the discovery of a large trade in this drug in Assam has enabled us to bring together all the recent facts in connection with the industry. On the receipt of the letter from the Director, Land Records and Agriculture, Assam, a set of questions was drawn up by the Reporter enquiring into the extent of the cultivation and commerce of the leaves. The replies to these questions sent in by the Director and other officials in Assam have assisted very materially in the compilation of a fairly complete *Agricultural Ledger* on the subject.

Botanical Origin.—Tej-pat is obtained principally from Cinnamomum Tamala, *Fr. Nees*, and its variety intermedium. The leaves under this name have also been derived from *C. albiflorum*, *Nees* (in the Lahore bazaars), *C. obtusifolium*, *Nees*, and *C. impressinervium Meissn* (in Sikkim), and the wild species *C. zeylanicum Breyne*. The Tej-pat from wild trees found in Mysore and referred to in the *Pharmacographia* would probably belong to the last named plant. Roxburgh alludes in his *Flora Indica* to Tej-pat leaves as those of *Laurus Cassia*, a name which is now synonymous with *C. Tamala*. It has been stated by some writers that the leaves of any species of cinnamon are indiscriminately referred to as Tej-pat by the Natives. *Vernacular*.—The drug is called *Tamali* in the *Raja Nirghanta* and this is probably the origin of the specific

time of the plant. *Tej-pat*, or, as it is also written, *Tidi-pat* and *Tez-pat*, is derived from *Twach* or *Twacha*, the Sanskrit equivalent for cinnamon bark, and *pat*, the leaf. *Dalchini* (Chinese bark) and *Taj* are Hindu names applied to any kind of cinnamon bark. The *Taleef Shereef* gives *Tudje* and *Putrudi* as other vernacular names. The leaves are the *Sazaj-i-Hindi* of Indian Mohammedans. In Kashmir the leaves are called *Barg-i-Taj* and in South India *Tamal patra* and *Talisha-pattiri*. From Assam we are informed that the cinnamon tree is called *Dieng Latyrpat* and the leaves *Latyrpat*.

Habitat.—Cinnamomum Tamala is wild in tropical and sub-tropical Himalaya, from near the Indus to Bhutan, at altitudes of 3,000-5,000 feet, ascending to 7,800 feet in Sikkim, and in Sylhet and the Khasia mountains to 3,000-4,000 feet. Gamble says it grows in the valleys of the Mahanadi and Tista, but it is not found much on the West of the Mahanadi. The tree is cultivated in Assam.

Cultivation.—In the Khasi and Jaintia Hills about six squaremiles are planted with Cinnamomum Tamala. Owing to the trees being grown amongst jack, betel-nut palms, and other fruit trees, the exact amount cannot be ascertained, but it is calculated that 400 acres are planted up in the Jaintia parganas and a small quantity in the submontane tracts, such as the Cherrapunji Hills in the north of the Sylhet district. The trees delight in a heavy rainfall. Continuous rain is said to be unfavourable for their cultivation, but heavy rainfall followed by bright sunshine is most congenial. Storms effect considerable damage by breaking off the leafy branches. It is also conjectured that excessive moisture diminishes the odour of the leaves. In the Khasi and Jaintia Hills the trees are grown in regular plantations 7 feet apart; the seedlings are raised in beds, and planted out permanently when the plants are five years of age. The tree takes five or six years to grow, or comes into bearing at ten years, and continues to bear for one hundred years. The cultivation is in the hands of the hillmen.

In Sylhet the trees are self-sown; the ripe seeds fall from the trees into the soil and germinate. When the plants are about a foot high they are transplanted. Great care is bestowed upon the plants when they are young and tender. As constant exposure to the sun would kill the shoots they are planted behind bushes or trees for protection. The undergrowth is kept down twice a year in the plantations for the first eight or nine years of the plant's life after that the jungle is cleared once a year in April. In some plantations the soil is dressed, but in most districts the soil is never manured or irrigated.

No reserve areas are kept for the growth of these trees. The *Tej-pat* and cinnamon trees are different. The former are only used for their leaves and no bark, or only a small quantity is collected in the Khasi Hills. A small quantity is sent to Sylhet from Sib-sagar and Lakhniapur by the Nagas.

Collection and Crop.—*Tej-pat* is plucked in dry and mild weather from October to December, and in some places the collecting is continued to the month of March. The leaves are taken once a year from young trees, and every other year from old and weak ones. On an average 15 seers may be obtained from one tree, but the quantity depends upon circumstances; a tree yields from 10 to 25 seers of leaves in a year. The average yield of leaf per acre in the Jaintia parganas is about 30 seers without, and 2 mounds with twigs. The whole of crop from four hundred acres was worth last year as much as Rs.1,100. The quantity of leaves from the Sylhet district last year calculated on the turn-over of the traders was estimated at 14,470 maunds, and from the Jaintia district 20,000 maunds.

In harvesting the *Tej-pat* the small branches are cut down with the leaves and dried in the sun for three or four days. The leafy branches are then tied up into convenient bundles ready for the market. In the other case, the leaves are separated from the branches and packed in bamboo nets of a cylindrical shape called *Bora* or *Junra* which are four feet long by two feet in diameter. The packages are carried down the ghaut roads of the hills by coolies to Sylhet,

Disease.—The young trees are not usually attacked by insects, but the old ones are sometimes destroyed by white ants. The leaves are subject to a disease called *Guti* (small pox). When attacked with this malady the leaves are spotted with black eruptions about one-eighth of an inch in diameter. Spots like these are often seen on mango leaves. Leaves injured in this manner are not plucked for sale.

Description of Tej-pat.—This is how *Tej-pat* is described in the *Taleef Shereef*. A very common leaf in length from 3 to 5 inches and the breadth 2 inches, of a green colour and pleasant smell; it is strongly marked by veins. It is brought from the hills. The author of *Makhzan* describes them as yellowish, coriaceous, ovate-lanceolate leaves with five nerves extending from base to apex, and says they are produced from a large tree growing in the mountains of Sylhet. The most careful description of *Tej-pat* is that of the *Pharmacographia Indica*. The leaves vary in size, the largest are 6 inches or more in length and 1½ inch broad, oblong, obtuse-pointed, entire, with three principal nerves and two smaller ones which are quite marginal; the venation between these nerves, which run from base to apex of the leaf is finely reticulated, and the leaves are of an olive-green colour; the upper surface is polished. They have a pleasant odour like a mixture of cloves and cinnamon.

Uses.—*Tej-pat* partakes of the aroma, pungency and probably carminative properties of cinnamon bark, and is largely used as a spice in various culinary operations. According to Dr. Aitchison the leaves are used in Kashmir as a substitute for betel-leaf or *pan* (Piper Betle, *Linn.*) and Dr. Lisboa speaks of their being employed in the preparation of curries in the Bombay Presidency. *Pan* and various curry leaves have to be used in a fresh condition on account of the fugitive nature of their aromatic principles, but *Tej-pat* possesses a distinct advantage over other leaves in retaining its volatile oil for a considerable time after being plucked and dried. As a matter of fact, cinnamon leaves in India take the place of the domestic flavouring agent in England known as Bay leaves (*Laurus nobilis*).

In the *Taleef Shereef* or Indian Materia Medica (translated by Dr. George Playfair, 1833) the medicinal properties of *Tej-pat* are described as being hot and light and cardiac, useful in wind, piles, nausea, pain in the stomach and flatulence. The author of the *Makhzan* considers the drug to be carminative, stimulant, diuretic, diaphoretic, lactagogue and deobstruent. In the *Kaja Nirghanta* it is mentioned as a remedy for the expulsion of phlegmatic and rheumatic humours and is prescribed in cases of flatulence and dyspepsia. Besides being used directly in medicine, the leaves are employed as adjuncts to other drugs to render their exhibition less nauseous.

The third use is that of a dye. In the North-West Provinces *Tej-pat* is mixed with myrobolans and employed in calico printing and apparently acts as a clarifier. The bark and leaves of the *Taj* are used in Chutia Nagpur as an auxiliary with *Kamelá* (*Mallotus philippinensis*) as a dye.

Chemical Composition.—Kurz in his "Forest Flora of British Burma" made a very suggestive statement, when, in describing *Cinnamomum zeylanicum*, he said, "The leaves yield oil of cloves." The cloves are obtained from quite a different plant (*Eugenia caryophyllata*, *Thun.*), but it is a remarkable fact that the prevailing constituent of the oil is identical with that found in cinnamon leaves. The oil of the leaf was first described by Kampfer in 1712. Dr. Stenhouse in 1854 found it to have a specific gravity of 1.053 and to consist of almost pure eugenol with a little terpene and cinnamic aldehyde. Professor E. Schmidt, Berlin, confirmed the result of this analysis in 1891, and further showed that the oil of cinnamon root contained eugenol and terpene, and the oil of the bark cinnamic aldehyde and terpene. The oils of cinnamon leaf and cloves are, therefore, remarkably similar in consisting of a large proportion of a chemical body known as eugenol or eugenic acid.

Commerce.—A small quantity of Tej-pat is consumed locally, but the bulk of it is exported to Narainganj, Dacca and other places in Bengal. The Khasias usually sell the leaves in Sylhet to Bengal merchants who send the leaves to a large extent to Calcutta. The price of the leaves is 8 to 10 annas per maund with branches, 14 annas with twigs, and R1-4 to R1-6 cleaned.

Tej-pat is largely imported from Nepal and the forests of the North-West Provinces. About 33 tons of leaves and 24 tons of bark are annually exported from the tract between the Ramaganga and Sarda rivers of the Kumaun district. Gamble notices the collection and sale of the leaves in Sikkim.

The following table shows the return of the sales of Tej-pat from three districts in the North-West Provinces about twenty years ago:—

	1874-75.	1875-76.
Bijnor . . .	36½ cwts. R 62	18½ cwts. R 76
Garhwal . . .	14½ " „ 30	35 " „ 37
Kumaun . . .	88½ " „ 272	120½ " „ 374

TEA EXTENSION IN CEYLON.

NEW FACTORIES TO BE BUILT IN 1893.

Messrs. Brown and Co., the well-known engineers at present have their hands very full executing a number of big orders for factories that have been entrusted to their Nawalapitiya branch. They have something like a dozen new factories in hand for this branch alone, and the manager, Mr. Geo. Brown, having to supervise all the works, is now kept continually on the move. A week ago he was away in the Kelani Valley, while yesterday he was again in Colombo on his way back from Udugama, and to-day, he set out again for upcountry. The work that took him south was the erection of a factory at Udugama on the property owned by the Udugama Tea and Timber Company. Here they are now erecting a large new factory, and the building to be made in such a way as to be capable of extension; but at the outset the dimensions will be 100ft. by 40ft. with two floors above the ground floor. The factory is to be built with brick pillars and brick walls, with ironcross-beams and centre columns. The roof will be of wood. It is to be fitted up with a 40 horse-power turbine with a fall of 50 feet, and the installation will include steel-piping, 20 inches in diameter. The machinery at present employed in the two old factories hitherto used is to be re-erected in the new building, with several additions of new machinery of latest design. The work has been commenced, and the factory is to be completed in four months. This will place the Udugama factory much nearer to Galle and close to the main cart road. The Company has got extensive reserves of jungle, amounting to several thousand acres, and we have no doubt there is a good future before it, although up to now it has been working under difficulties, chiefly as regards manufacturing its crop. There is also being erected on Donside, near Nawalapitiya, a factory of which a feature will be the way the motor power is to be provided. Arrangements have been made to place the factory on the main cart-road, to facilitate transport, and the water-power (which is at a considerable distance from the factory) is to be availed of by means of wire-rope transmission. Detailed plans have been made and submitted for this work, and, no doubt, it will prove as great a success as it has already proved in other countries, although this system of water power transmission has not been hitherto largely employed either in England or Ceylon. We believe that this will be the largest wire-rope transmission of the kind in Ceylon. The work has been ordered by Mr. Hector and is already progressing. The new factory is also being constructed. It is being built so as to permit of extension at a later period, but at first will be 72 feet long by 35 feet wide. The building will be a two-storeyed one, and all the machinery it will contain will be new, as, there not having been

a factory on the estate before, there is no old machinery to be utilised. The place will be of brick and iron, with an iron roof. The work has just commenced and is to be finished in four months.

TEMBILAGALLA.

A third new factory is going up on Tembilagalla, near Oolapane, the property of Messrs. George Christie and Haycock. It will be precisely similar to the factory just described as in progress on Donside, as far as relates to materials and accommodation, while water-power will also be used for this.

A NEW WITHERING HOUSE FOR SANQUHAR.

A new withering-house of unusual size is in progress on Sanquhar estate, near Gampola. This work has been in hand about two months, and is expected to be finished by the end of next month. The dimensions are 72 feet by 35 feet, and the building will carry two floors above the ground floor. It will be used entirely for withering, and will be an addition to the large factory that is at present in working.

DEVELOPMENTS ON GALATA.

A new turbine installation is being put in on Galata estate, near Gampola, on the other side of the river to Sanquhar. This work has been in progress three weeks and will be finished in a week's time. The horse power is 15 with 80 feet fall.

THE NEW FACTORY AT RATWATTE.

Messrs. Brown & Co. executed a very smart piece of work for the Ratwatte Tea and Cocoa Company. They were commissioned to put up a complete factory, and, by their contract, they had to do it in four months; but they did it in three. It is now in full working order, and everything is going on excellently. The motor power here is a 24 (brake) horse-power and a large locomotive multitubular type of boiler. The new machinery supplied to the factory consists of one large down-draft improved sirocco; one 32 in. Rapid roller; one of Brown & Co.'s made-tea sifters; and one Breast roll breaker. This latter machine has been lately very much improved, and is reported to be doing excellent work. The dimensions of this factory are 50 feet by 40 feet at present; but extensions are likely to be made very soon. The factory, like the preceding ones described, is of two storeys, with iron roof, iron columns and cross pillars with brick walls. The rapidity with which this work was carried out (in a month under contract time) has excited much favourable comment.

A BIG WHEEL ON CRAIGHEAD.

The next work calling for description is one fully as interesting as any that we have already enumerated. For long, Craighead estate, in Dolobage, has relied on two 13 horse-power turbines; but lately there has been a large acreage opened on this estate, and additional machinery being, therefore, required, extra driving power had to be obtained. It was accordingly decided, on the advice of Messrs. Brown & Co.'s experts, to discontinue the old turbines and substitute therefore a big Pelton wheel. This has now been done, and Craighead now boasts the largest Pelton wheel in the Island. The wheel has been most satisfactorily introduced, and this despite the fact that it is working under a comparatively low fall. The following are the dimensions of the wheel:—diameter 72 inches, (weight 19½ cwts. without shafting and other accessories); horse-power, 45½; fall, 30 feet evolutions, 115 per minute. The water supply is 400 cubic ft. per minute. This wheel has been thoroughly tested, and has been in use long enough to show that the change is a beneficial one and the proprietor has assured the engineers that he is more than pleased with the results.

A NEW FACTORY AT RAXAWA.

There are two Raxawas in Ceylon, but the one at Dolobage has been enterprising enough to order a new factory, and the site for it has just been cut. It will be of two storeys—dimensions 70 feet by 30 feet; and the contract stipulates that it is to be handed over in four months' time. We understand that the motor-power to be used is a Pelton

wheel, with a very large fall, namely, 500ft. The supply of water, however, is small and in consequence the effective horse-power is only to be 15; but we are informed that this will be quite sufficient for the requirements of the property. The machinery to be supplied will be all new, and of the latest and most approved types.

A PROJECTED FACTORY ON UDABAGE.

There is a scheme afoot for a large factory on Udabage estate, in the Kelani Valley. The motive-power is to be a 40 horse-power turbine; but as this work has not yet been put in hand, we are unable at the present moment to give further details; but we may say the factory will be a large one—about 100 ft. long by 40 ft. broad, and, like all the other factories here described, it will consist of a ground-floor and two upper floors.

The list we have given is probably an unprecedented one of work proceeding at one period; but it by no means exhausts the statement of operations Messrs. Brown & Co. are carrying out, for their Hatton branch has a good deal of work of a similar kind.

In addition Messrs. Finlay, Muir & Co. are putting up

A BIG FACTORY ON CHESTERFORD ESTATE,

in the Kelani Valley. This will be a noteworthy work, when it is completed. As our readers know, Messrs. Finlay, Muir & Co. employ their own engineer (Mr. W. Pottie), who supervises their buildings the actual work of erection being given to contractors, who work under the immediate direction of Messrs. Finlay, Muir & Company's superintendents. The new Chesterford factory is to be completed by the first week in February, and will be 150 ft. in length, and 40 ft. wide, with annexes. There will be a ground floor and two upper floors, and the structure will be an iron building with tea weatherboarding and window sashes all round. It will be a very fine building when completed, and great credit is due to the superintendent (Mr. Angus) for the speed with which the work has so far been carried out, and to Messrs. Walker, Sons & Co., who have furnished all the necessary iron-work in an incredibly short space of time. The factory will serve both Chesterford and Madooltenne, and is very central. Old Madooltenne factory adjoins it, and will be converted into a withering-house; while all the old machinery of the two factories will be re-laid in the new building, and will be supplemented by a new Paragon tea-dryer; one of Jackson's 32 inch Rapids; and one of Mickie's made-tea sifters. The power will be steam; and the engine one of Marshall & Sons' 12 horse power.

A HUGUE FACTORY AT CHETNOLE.

At Chetnole in Balangoda, the same firm are putting up, under the supervision of Mr. Clark, a new withering-house, 100 ft. long by 40 ft. wide—and, like the other buildings described, one of three floors. Moreover, the existing factory is to be extended, and a new turbine, with a fall of 150 ft., and capable of developing 40 horse-power, is to be installed. With the addition of a new withering-house, and the extension of the factory, the factory (which, by the way, serves also Meddakande estate) will be capable of turning out 600,000 lbs. of made-tea a year. The new building will be of stone and timber, with center pillars and cross-beams of iron, and a roof of corrugated iron. Plans are now being made, but the work is wanted quickly, and it is to be executed with all possible speed.

RASAGALLA'S NEW FACTORY

—a work also under the supervision of Mr. Pottie, and like the last, directly superintended by Mr. Clark,—is rising fast, and here again Messrs. Walker, Sons & Co. have shown great expedition in preparing the iron-work, for, though it was only ordered a month ago, it is now ready for despatch. For this work, however, there is no immediate hurry as far as regards completion as it is intended to finish Chetnole before this, and also before

THE NEW FACTORY AT HOPWELL

is completed. This last-named mill is being put

up under the direct supervision of Mr. Wm. Taylor, and when finished it will be 200 ft. long by 65 ft. wide, and 40 ft. high—in a word, one of the largest factories in the island.

THE HAPUGASTENNE CART ROAD.

A different class of estate work, but an equally important one, is now in progress in the Ratnapura district, when a cart-road is being cut from Ratnapura to Hapugastenne. There will be about 17 miles of this road, which will ultimately be carried right on to Hopewell. The work has been begun from the Ratnapura end, and is in charge of Mr. A. J. Emery, the manager for the Hapugastenne estates. The Road is already cut, almost to the tenth mile.

AN AERIAL TRAMWAY IN TRAVANCORE.

Messrs. Finlay, Muir & Co., however, are not only busy in Ceylon, for we hear an important undertaking they are about to set on foot in Travancore, where they propose to construct an aerial tramway extending from the bottom of the ghant at Bhodiniya-Koonoor to the Yallaka Gap—a distance of about six miles. When completed it will give Messrs. Finlay, Muir & Co., a second outlet from their land. We have frequently referred to the work going on to the West, where Mr. Benzie is engaged in making a cart-road which will place the property in direct communication with Cochin. That is steadily progressing, but the firm deemed it advisable to have an alternative outlet, and so they propose on the eastern side of their block to put up an aerial tramway, which will convey their produce eastward to a point on the main road whence it can easily be forwarded to Ammanaya Koonoor, the receiving railway station for goods intended for Madras. The tramway will begin at an elevation of 2,000 feet, and will reach an elevation of 6,000 feet, and will be over a trace surveyed originally and recommended by Messrs. Benzie, Mickie & Pottie. Our readers will see at once that it will allow Messrs. Finlay, Muir & Co. to send produce down and to get rice up much more advantageously than they have hitherto been able to do. Tenders are to be invited for the work; and amongst those who have gone up to inspect the land and judge on the spot what is wanted is Mr. G. H. M. Hyde, of the Colombo Commercial Company, so that Company will possibly tender.—Local "Times"

BRITISH GUIANA AND CEYLON.—The *Times of India* says:—"Some time ago, in discussing the report of the West Indies Commission, we took occasion to compare the condition of British Guiana with that of Ceylon. We pointed out that both Guiana and Ceylon had, at a certain stage of their existence, suffered grave reverses owing to the failure of the respective industries upon which their prosperity depended; and we instituted comparisons regarding the subsequent policy pursued by the inhabitants of the two colonies, which did not altogether redound to the credit of the Guianese. A Guiana contemporary, the *Demerara Chronicle*, has published a reply to these criticisms, in which it points out that Ceylon, with its 3½ million inhabitants, has infinitely better opportunities for development than has Guiana, which only possesses 300,000 people all told. The disparity in population means, it urges, 'a vast difference in the cost of labour, a far greater consumption of dutiable products, and a larger number of people to occupy lands newly opened-up.' Had it not been for the artificial increase induced by immigration from India, Guiana, says the *Demerara* journal, 'would have made hardly any advance upon the position held at the time of Emancipation.' At the same time, the general accuracy of our contention that the present depression would have been far less serious if the colonists of past generations had been less concentrated upon the sugar industry, and had tried to develop the other resources of the colony, is admitted."

WHAT WE EAT AND DRINK.

ADULTERATION AND NOMENCLATURE.

Dr. F. L. Teed, F.I.C., public analyst for Islington, in a report to the local vestry, issued yesterday, states that in one instance recently, he found "the custom of the trade" was for a vendor when asked for "coffee" up to 1s 6d per pound to hand the purchaser a mixture of fifty per cent. of chicory and fifty per cent. of coffee in a wrapper marked "This is sold as a mixture of coffee and chicory." Another defendant declared that unless "pure" coffee was asked for, this mixture was always given to the purchaser.

Dr. Teed adds:—"It seems to me that if this perversion of the meaning of words goes much further, it will become necessary for tradesmen to compile a dictionary of their own, so that the simple-minded public may understand the meaning they attach to the words, which, up to now, referred to unsophisticated foods. Demerara sugar is no longer that article, but yellow crystals, unless you ask for pure Demerara; butter is a mixture containing ten per cent. of margarine, unless you ask for 'pure' butter; whisky is a spirit (mostly potato), and adulterated with an unknown percentage of water, unless you ask for 'pure' whisky, when as likely as not you will be supplied with the same spirit, but at a strength of twenty-five under proof. Cocoa powder is chocolate powder (a mixture of sugar and cocoa), unless you ask for 'pure' cocoa; yellow wax is no longer beeswax, but earth wax, unless you require it 'pure' while paraffin wax is unblushingly substituted for white wax, which is bleached beeswax; and so on. It is about time this subversion of English words was put an end to. It began with fraud, but now it is the 'custom of the trade.'"—*Home paper.*

JAMAICA.

THE VIEWS OF SIR H. A. BLAKE.

Sir Henry A. Blake, late Governor of Jamaica, naturally takes a keen interest in the welfare of the island, and his address last week before the members of the London Chamber of Commerce was an exposition of the condition and possibilities of the colony. Jamaica is not dependent upon any one industry, although sugar-planting is a very important factor. The island contains 2,692,000 acres, of which about 2,340,000 are cultivated. At present the area under the cultivation of the staple crops, is 30,000 acres in sugar, 19,000 in bananas, 25,000 in coffee, 11,000 in coconuts, and 1,700 in cacao. The value of the crops last year was £360,000 from sugar, £315,000 from bananas, and £169,000 from oranges. So that fruit-growing is developing rapidly into an enterprise of leading importance. Sir Henry Blake thinks that Jamaica has a right to ask the co-operation of the mother country in establishing a direct line of steamers between that colony and England. By that means the orange and banana industry of Jamaica would be largely improved. There is a large demand for both these products provided they could be brought to England in proper condition, and this can only be done by the establishment of a special boat service. Sir Henry Blake argues that Jamaica and the other West Indian colonies being weakened and ruined for the direct benefit of England, the home Government should come to their rescue. Barbadoes, which is entirely dependent on sugar, is in a very serious condition, as is British Guiana, and in the event of the failure of the sugar in-

dustry it will be necessary for this country to spend a large sum of money to provide these colonies with a means of revenue.—*H. & C. Mail*, March 11.

THE "COCOAS" OF LARGEST SALE.

In our Green Supplement this week is announced the result of competition in which readers were asked to record their votes for the twelve cocoa preparations having the largest sale. The result of this competition is a striking testimony to the value of enterprising and judicious advertisement. During many years chemists have taken a share in the distribution of cocoas, the names of some of which had become household words throughout Great Britain, but the result of this competition shows that these have been out-marched by a preparation which some three or four years ago was unknown. The fact that so large a proportion of a body of chemists all over the kingdom return Dr. Tibbles' Vi-Cocoa as having the largest sale is primarily due to the spirited policy adopted by the proprietors in making their specialty known to the public and to the trade, and while we do not wish to detract in any way from the credit to which they are entitled for this success there is no doubt that its achievement has been rendered a somewhat easier task than would otherwise have been the case by the supineness of the older manufacturers.—*British and Colonial Druggist*, March 18.

INDIARUBBER.

Fears are sometimes expressed that the supply of rubber from Para will stop some day, but our Consul at Para is not of that opinion. Writing at the end of December, he says that the majority of authorities on the subject are of opinion that there is absolutely no fear for the exhaustion of the supply of rubber in Amazonian States. In some cases this produce is transported as much as 6,000 miles before it reaches Para, but it is found that the prolonged transportation improves the rubber, so that when it arrives at its destination it sells for higher prices than that collected nearer the mouth of the river.

Our Consul at Zanzibar remarks that Africa may be said, roughly speaking, to be full of rubber from Zambesi to the Sahara. Hitherto the rubber brought down to the coast has been mainly collected by natives, who, under the pressure of hunger, have gone into the forests, tapped the vines and taken the balls thus extracted (one the size of a cricket-ball represents about a day's work) to the nearest Arab or Indian; but the German firm of Harsing & Co. have set the example of collecting the rubber in a systematic manner, and it is expected that in a few years a regular and better supply will be obtained.—*Chemist and Druggist*.

BLOOD POISONING FROM TEA BUSHES.—It will be remembered that Mr. R. W. Waller, of Poyston, Dikoya, was unfortunate enough recently to suffer blood poisoning in the thumb of his right hand as the result of a cut from a pruning knife, and that eventually, after consultation with Surgeon-Captain Hallaran in Kandy, that medical officer removed the injured thumb successfully, thereby preventing the probable loss of Mr. Waller's hand. We are asked to contradict the statement, however, that Surgeon-Captain Hallaran, in connection with this matter, stated that he had "often" seen blood poisoning ensue on wounds got in pruning tea bushes, as he said no such thing, nor had he seen anyone who had injured his hand with pruning a tea bush till he came across Mr. Waller's case, which was one of "epitheliomatous disease of the right thumb." It is pointed out to us that professional men who have spent their lives in Ceylon and elsewhere amongst tea planters must have thought Surgeon-Captain Hallaran's statement extraordinary, but, as a matter of fact, he never made it.

ROYAL BOTANIC GARDENS, CEYLON:
REPORT OF MR. J. C. WILLIS, M.A., DIRECTOR.
(See Supplement with Report.)

Following the admirable example of his predecessors, Mr. Willis continues to be first in the field of all the Administering Officers of the Government, with his Annual Report. Nor is this because of less trouble or value attaching to the compilation; for, with five separate Garden establishments under his care—each of which is separately dealt with—the Director at Peradeniya has as much to look after and embody in his Report as some of our minor Government Agents who are often well beyond the first quarter of the year before they send in their returns. Let us hope for greater promptitude all round in the present year.

There is no lack of interest attaching to the contents of the Report before us; but it strikes us as less full and novel in the department of most value to the general public, that dealing with "Economic Plants," than in previous years. And indeed this was inevitable in view of the publication of the periodical "Circulars" begun a few months ago by the Director and which have been welcomed on all sides. In these Circulars, Mr. Willis has been giving information for which, ordinarily, we should have to wait until we got the Annual Report where, of course, it would add to its novelty, bulk and importance. For the future, therefore, we may consider so far as our planting and agricultural world is concerned, the Circulars dealing with horticultural, agricultural and botanical subjects and issued periodically, as to a great extent superseding the Annual Report, though the latter may conveniently sum up the more important features of the year's work. It is satisfactory to learn that the general condition of the Gardens has improved, very much due to more liberal votes, though indeed only R3,100 of an increase and about R2,000 of a special vote were required to effect the change for the better. The appointment of Mr. E. E. Green as Honorary Entomologist is heartily welcomed and he and the Director have been busy studying not only the Cacao disease, but also various diseases of Tea, Coconuts, Betel, Nutmegs and other plants, though we are only told results in the case of the first-named. A good deal of attention has been given by Mr. Willis to "Rubber" as evidenced by the recent special Circular and to "tapping" experiments at Heneratgoda, of which we are to hear a good deal more by-and-bye. The interest in this product has manifestly increased: 88,500 seeds of the Para kind having been sold to planters in 1897 out of the total crop of 100,000; but we scarcely think it is correct to say that the Gardens form, practically, the only source of seed from mature trees? Mr. Willis anticipates Rhea becoming an important cultivation, but only where there is an ample, well-distributed rainfall and a plentiful supply of manure to renovate the rapidly exhausted soil; two conditions which, we suspect will limit the Rhea area very much—though we are told of several planters experimenting on a small scale. A stimulus, too, in a small way has been given to Vanilla cultivation; while the fall in price has checked attention to Liberian Coffee. Mr. Willis takes an interest in the expansion of our great Coconut industry; but by far the two most important paragraphs in the Director's Report on the present occasion refer to our two upcountry staples, Tea and Cacao. In reference to tea, Mr. Willis gives a

word of warning to our planters which we feel sure, will be carefully considered and duly acted on,—all the more readily because there is no dread enemy apparent at present:—

The immense area now covered with tea still remains singularly free from disease, but great care and attention must be exercised if this condition of things is to last. When an outbreak of any disease apparently due to insects or fungi is noticed, the affected plants should be at once destroyed by fire to prevent, if possible, any further spread of the disease. One or two cases have occurred during the year of outbreaks of disease among nurseries of young plants grown from Indian seed. Planters should pay special attention to their nurseries in this respect, as considerable risk is run of importing dangerous or troublesome diseases with foreign seed.

In regard to "cacao," the Director refers to the investigation made by Mr. Green and himself and how the disease was found to be due to the attack of a "fungus," which of course specially concerns a Cryptogamist; but here again we had better give the paragraph *verbatim*:—

Much attention has been given during the year to the canker mentioned in last year's report. During the early part of the year an extended investigation of the diseased areas was made by the staff of this Department, and the disease was found to be common in nearly all parts of the Central and Uva Provinces. The disease was found to be due to the attack of a fungus, whose exact nature is at present unknown, but which almost certainly belongs to the class of fungi which cause the various cankers of stems and roots. The information collected was published in two of the circulars issued by this Department, in which also suggestions were made as to the treatment of diseased areas or plants and the prevention of further spread. It was suggested early in the year that a specialist in fungus diseases should be engaged by Government for the study of this disease. This proposal, being adversely reported upon, ultimately fell through. There is much misconception as to the capabilities of a specialist. His speciality is simply to discover the exact nature and life history of the fungus causing the disease. Many persons seem to think that once this is done he will be able to propose some simple wash or other treatment which will at once stamp out the disease where it already exists and prevent its re-appearance or its appearance in new places. This is far from being the case. The treatment of a fungus disease must generally be by improved cultivation, destruction of diseased plants, disinfection of the soil and surroundings, and preventive measures generally, but to cure plants already diseased is usually almost impossible. Whatever may be discovered about the life history of the fungus, the treatment of the disease will be much the same. Had the disease been dealt with when it first appeared many years ago it would not now be so widespread. There seems now but little chance of freeing the old red varieties from it in most districts of the Central and Uva Provinces. The Forastero varieties seem much more capable of resisting the disease; the planting of these varieties is extending, and it seems likely that they will gradually replace the old red cacao to a very large extent.

It is strange no allusion is made to the presence and work of Mr. Carruthers; but until the Government extend its countenance and patronage, it may be premature to do so; and indeed Mr. Willis has done the very best service to the "Cryptogamist" by warning planters not to think that a "Specialist" can work a miracle in providing a remedy, even when he accurately works out the life history of a disease. The necessity of dealing with all plant diseases at the earliest possible stage is very clearly shown in the present case. Mr. Nock gives interesting

information in regard to fruit-trees, camphor, &c.: but we refrain from extracts, since we expect to give the greater part of the entire Report as a *Supplement* (handy for reference) with our tomorrow's issue. In conclusion it is interesting to learn from Mr. Willis how usefully the Laboratory, attached to the Peradeniya Museum has been utilised during the past year, by no fewer than five scientific visitors:—

(1) Mr. W. G. Freeman, of the Royal College of Science, London, from January 1st to March 19th; (2) Dr. A. J. Ewart, Deputy Professor of Botany at Queen's College, Birmingham, from April 6th to April 29th; (3) Dr. O. Penzig, Professor of Botany at the University, Genoa, from April 10th to April 16th; (4) Dr. G. Clautriau, of Brussels University, from May 26th to June 8th; (5) Mr. H. H. W. Pearson, Assistant Curator of the Herbarium in the University of Cambridge, from July 19th to December 7th. Mr. Freeman was chiefly occupied with studies in the anatomy of plants, Dr. Ewart with bacteriology and observations upon the effects on vegetation of tropical sunlight. Mr. Pearson made an extended study of the flora of the patanas.

The receipts from sales rather fell off last year in consequence of a very proper withdrawal from the sale of pot plants for verandah purposes at less than cost price; but the value of the Botanical Gardens and of the work of the Director and Staff is not for a moment to be considered in this connection; since the indirect return for the total expenditure of Rs2,500 is most ample, varied and important, and we trust some day soon will be made even more so than at present, by permanent additions to the Scientific Staff of the Gardens.

COFFEE IN BRAZIL.

Mr. Scott Blacklaw sends us an extremely interesting letter on the present occasion—see page 677—regarding the mode adopted in Brazil in growing, harvesting and curing our old staple “coffee.” So little is seen of coffee locally, now-a-days that to many of our readers, all the information will seem novel and the means of making a comparison with the usage in “days of old” in Ceylon, may be wanting. Such a picture as even one hundred acres of coffee in simultaneous blossom—the bushes white with jasmine-like flowers as if covered with newly fallen snow—or again a field laden with scarlet and purple cherries, is now unknown in our planting regions and the sound of the pulper is unheard in the land. Mr. Blacklaw brings back very vividly the time when coffee was king with us, by his detailed account of the process observed on the plantations of the Brazil and the information he affords as to the course of prices and exchange, the cost and working of colonist labour are very instructive. It will be observed that Mr. Blacklaw is very confident as to the future of the industry in the South American Republic, even if the Ceylon system of harvesting and curing be not adopted. It will be interesting to watch how far the Managers for the Dumont Company are able to introduce improvements in this direction, and how much more than the average price they are, in consequence, able to secure for their coffee in the European or American markets. We may be sure that if they score a special success, it will not be long before other proprietors follow their example and we may then find a keen demand for coffee preparing machinery set in, to the benefit of Ceylon manufacturers!

INDIAN TEA CROP.

The latest circular to hand of Messrs. W. Moran & Co., Calcutta, affords us interesting information concerning the Indian tea estimates and actual crops (as made up by the India Tea Association) for the past year. Here is the detailed table:—

	Original Estimate of Crop.	Revised Estimate of Crop.
Assam	63,359,989	58,737,822
Cachar	21,540,153	20,924,401
Sylhet	26,762,000	25,470,920
Darjeeling ..	7,644,250	8,303,876
Terai	3,734,000	2,738,766
Dooars	24,209,720	22,955,867
Chittagong ..	919,000	925,458
Chota-Nagpore	320,000	204,588
Kangra	2,180,000	1,750,000
Dehra Dun and Kumaon (Estimate) ..	2,000,000	2,000,000
Private and Native Gardens (Estimate) ..	4,000,000	4,000,000
	<hr/>	<hr/>
	156,669,112	148,011,705
	<hr/>	<hr/>
	1897.	1896.
	Actual Out-	Actual
	turn of Crop.	Outturn.
Assam	58,160,029	59,655,793
Cachar	20,720,053	20,401,487
Sylhet	25,405,001	25,099,486
Darjeeling ..	7,755,947	7,817,495
Terai	3,283,654	3,738,927
Dooars	23,960,237	22,073,781
Chittagong ..	1,020,659	1,030,125
Chota-Nagpore	146,828	220,322
Kangra	1,800,000	2,180,000
Dehra Dun and Kumaon (Estimate) ..	2,000,000	2,000,000
Private and Native Gardens (Estimate) ..	4,000,000	4,000,000
	<hr/>	<hr/>
	148,252,408	148,217,416

It will be seen that the original estimate framed at the beginning of 1897 was out by over 8,400,000 lb., although the revision that took place in July proved wonderfully near the actual result. The Indian tea crop of the past year was almost identical with that of 1896—only 35,000 lb. of increase! Assam is responsible for more than 5 million of the decrease on estimate; Cachar and Sylhet for over 2 million more.

A further table shows export and distribution of Indian tea from 1st April last year (the beginning of the Indian tea season) up to 15th Feb. instant. Here are the figures:—

	Total quantity of Tea passed through Calcutta from 1st April to 15th February.		
	1897-98.	1896-97.	1895-96.
Great Britain ..	132,155,252	131,412,381	120,223,505
Foreign Europe ..	761,084	456,258	276,295
America	2,015,133	1,926,909	1,080,234
Asia	3,365,481	4,190,289	4,787,951
Australia	6,634,662	5,863,192	6,581,356
	<hr/>	<hr/>	<hr/>
	144,931,612	143,829,029	132,949,341

The total increase on the previous season is only 1 million lb., and the comparative increase in 1897-8 over 1896-7 to Australasia is not quite 800,000 lb., while it is very little above the shipments thither in 1895-6! Ceylon is doing a far better tea business with our Australian Colonies. The increase to America direct from India is also very gradual: let us hope 1898 may show up better.

CEYLON TEA IN RUSSIA.

The main business transacted at the meeting of the "Thirty" Committee on the 16th Feb. in Kandy had to do with the promotion of Ceylon tea in Russia and the work of advertising is evidently to go on apace; for Mr. Rodrigue is to be once more patronised with Ceylon funds, and £1,000 are voted to Messrs. Crosfield, Lampard & Co. to advertise and push our teas in the same country; while, above all, Mr. Christie is empowered to arrange for systematic advertising of Ceylon teas in Russian newspapers.

But far more important, in our opinion, than all these steps, would it be to send in a well-considered, carefully-worded Memorial—say from the Ceylon Association in London—to the Russian Minister of Finance, pointing out the great field there is for benefitting the imperial revenue, the trade of the empire and the Russian people as a whole, by following the British example and reducing the duty on tea from 1s 10½d to 1s, to 8d, or even to 6d per lb. It cannot be said that revolutions or conspiracies are nourished on tea, or that the reduction of the tea duty would tend to the spread of Nihilism or Socialism in any form. Quite the other way about! Cheap tea and universal tea-drinking in Russia should lead to increased happiness and general contentment among the common people; while the Czar's exchequer would, at the same time, be greatly benefited. Who will (not "bell the cat," but) enlighten the Czar and his Minister? That, in our opinion, is now the chief problem in connection with the future of the Consumption and Prices of Ceylon and Indian teas.

EXPERIMENTS TO TEST DURABILITY OF WOOD.

Eleven pieces made like paving blocks were buried to about $\frac{1}{2}$ of their length in sandy soil in an exposed sunny place in the grounds of Wilhelmsruhe, Turret Road, on 3rd October, 1896. Six of the pieces were marked by means of tin tacks driven in on one side, and three were marked by notches cut in the side. The two outside pieces were not marked and are Kumbuk. The first examination of the blocks was made on 21st October, 1897, *i.e.*, just over a year after they were put in. All the portions exposed to the sun and air were slightly cracked, especially Tumpalai, but with the exception of Illupai, all the pieces were sound. The following report as to each piece is:—

Outside piece "Kumbuk" covered by fungus on exposed side and slightly touched by white ants otherwise sound.

One tin tack. "Illupai" (Mi) from E.P. half eaten through by white ants.

Two tin tacks. "Tumpalai" E.P. somewhat cracked on top surface, under ground outside wood a little soft, otherwise sound.

Three tin tacks. "Kumbuk" E.P. sound-wood slightly softened on surface.

Four tin tacks. "Kumbuk," N.W.P. sound.

Five tin tacks. Mills E.P. quite sound.

Six tin tacks. "Halmilla" E.P. one side, slightly eaten by white ants, otherwise sound.

One cut notch "Mukalai" (Munamal) E.P. quite sound.

Two cut notches "Palu" N.W.P. quite sound.

Three cut notches "Palu" quite sound.

Outside piece "Kumbuk" outside slightly eaten by white ants. A. F. BROWN.

—Ceylon Forester.

TEA IN SOUTHERN RUSSIA: MR.

WEBSTER AGAIN.

The following is an excerpt from an article in the *Pioneer* entitled "A Trip to Central Asia":—

Anglo-Indian readers will be interested in the fate of the attempts lately made to introduce tea into Southern Russia. The Empire imports between 50 and 60 million pounds of that product by sea; for arrivals by caravan from China are yearly dwindling in quantity. Of this 22 millions come to Odessa, mostly carried at very low freight, by the "Volunteer fleet," which would otherwise return nearly empty from the Far East. The source of supply has, till recently, been Northern China. But I heard at Odessa that a broker named Trautman had imported eleven tons of Ceylon tea with very satisfactory results. Mr. Trautman was in the China trade as far back as 1843, and has thus watched the markets for more than half a century. It argues well for the future of Indian tea in Russia that he should have embarked in the new venture. I learnt from a Mr. Webster, whom I met on the Black Sea steamer, that large shipments of our Indian product have been made during the last few months to Terbizond, a Turkish port on the southern shore. The route taken is *via* Bombay and Aden, where the tea is transhipped into vessels of the Volunteer fleet. From Terbizond it is smuggled across the Russian frontier, which is protected by Cossacks open to pecuniary influences. The pioneers in this branch of trade are Parsees. Mr. Webster is a Ceylon planter and shipper of old standing who has, for the last three years, been engaged under the auspices of a Ceylon association in preaching the gospel of Indian tea throughout the world. He is, perhaps, the greatest traveller in an age of universal locomotion; and, as he is equally interested in our northern plantations as a shipper, planters may rest assured that if markets can be found for their product Mr. Webster is the man who will find them. He gave me some deeply interesting particulars of an effort to introduce the cultivation of the cheering plant into Caucasus. Three years ago it occurred to a millionaire merchant of Moscow, a Mr. Popoff, that tea grown in the Russian Empire would escape the customs duty of 1s. 10d. per pound which the imported article is charged. With the sanction of Government he took up a few acres in the Tchakvi Valley, eight miles north-east of Batoum, and set out 150,000 China plants. This was three years ago, and the produce is already so assured that a specimen was presented to the Tsaritsa and was honoured with Her Majesty's approval. The Government has a small plantation in the neighbourhood, and there is a third belonging to the heirs of a Russian colonel. In all a hundred and fifty acres or so of tea have been planted in the Western Caucasus. The climate is everything that can be desired, for Batoum is as rainy a place as Darjeeling of Silchar, but Mr. Webster is inclined to doubt whether the soil is not too heavy and agrillaceous to produce tea of respectable grade. I tasted a sample on the steamer, and, though a layman, was able to pronounce it to be rather oily and rank flavoured. Mr. Webster, however, thinks it suitable for Russian consumption and fully worth the 6d. a pound at which an Odessa expert valued it. It is beautifully made by hand, for Mr. Popoff is no believer in machinery."

INDIAN TEA ASSOCIATION.

TEA FUND FOR AMERICA.—NEW BULKING REGULATIONS.

Abstract of Proceedings of a meeting of the General Committee, held on 7th January 1898:—The Chairman announced that the contributions promised to the American Market Fund amounted to Rs 1,02,039, being Rs 1,635 below last year's levy but; he pointed out that this did not include the sum of £200 contributed by the Assam Company

in London. In his letter of 26th November, the London Secretary stated that he had called on the Secretary to Her Majesty's Customs in reference to the question of granting further facilities for the bulking of India and Ceylon tea of the same mark arriving by different ships, at the London Warehouse, and (he subjoined copy of the fresh regulations which had been issued on the subject,) which substantially conceded all his Committee had asked for:—"The following Regulations, affording further facilities for the bulking of India and Ceylon tea are to be brought into effect in the Port of London. "(1) Parcels of Indian and Ceylon tea bearing the same garden mark, but imported by different ships, may be bulked together for home consumption, exportation or ships' stores. "(2) On request to the surveyor at the station at which any tea proposed to be dealt with under this order is to be warehoused, the bringing to account of the first and subsequent consignments may be deferred until all the packages have arrived provided that no package, remain in warehouse for more than two months from the date of the ship's report, without being weighed and brought into account." The same letter contained an extract of a letter from the Managing Director of the Assam Company as follows:—"I am much of opinion that the large quantity of tea-sweepings now imported, tends to lower the value of dust, and looking to the fact that we can now obtain no more than 2d per pound for sweepings, leaving us certainly not more than 1d per pound net, it is pretty clear to me that if all growers would cease shipping this stuff, we should be the gainers inasmuch as there is a good demand for theine and if the manufacturers cannot get our cheap rubbish, they must come to the market and compete for dust. "Please consider this, and see if you can get the views of other shippers." After some discussion the Secretary was instructed to write to the London Secretary, and request him to forward particulars as to the demand in London for dust and the amount of dust and sweepings respectively imported.

In this letter of 3rd December, the London Secretary stated that his Committee had tried in the past to introduce a reform in the system of nett weighing, but their efforts had not been rewarded by any permanent improvement in the system of weighing tea in the warehouses. They would, however, give due consideration to the question again, in view of the expression of opinion entertained by the General Committee.

He also stated that a meeting of Members had taken place, and in consequence of the views expressed by those present, the following resolution was passed unanimously, viz., "That the Association regrets that it does not at present see its way to induce Members to conform to any general rule in the matter of printing the place of bulking, and that Members be left to act as their interests may suggest."
—*Indian Planters' Gazette*,

THE PLANTERS' ASSOCIATION AND CACAO.

The annual meeting on the historic "17th" terminated with a very useful piece of business accomplished on the initiative of Mr. de Sanctis, by securing the consent of the Association to defray the cost of much-needed analyses in connection with the cacao plant. We shall look with interest to the result of these analyses and to the comparisons which can then be instituted between our trees and those of Trinidad and other cacao-growing Colonies, where analyses have already been accomplished. We can quite understand how Mr. Willis in all good faith gave his opinion at the time he did to Mr. Thistleton-Dyer, against the sending out of a Cryptogamist. It must have been after the decision arrived at by Mr. E. E. Green and himself that the fault of the cacao-planters

trouble lay in unsuitable soil, want of drainage or proper cultivation. However, now that a Cryptogamist has arrived and is at work, we feel sure that Mr. Willis rejoices in his presence and work (which will be valuable even if it proved a 'negative' as regards a fungoid enemy), and will be ready, if required, to recommend the support claimed from Government by the Planters' Association.

A LUCKY BOX OF TEA.

(Communicated.)

The aged and wealthy proprietor of one of the finest residential estates on Donshire, Aberdeenshire, sat one autumn day in his back parlour. He lived a very retired life, seldom seeing anyone and had a specially well-rooted objection to receiving his near relatives.

A tea planter at home on furlough, was fishing in the Don—the trouts were not taking—and the idea struck him—"I will go and call on the old huffer." "Ah, you need not trouble yourself" said a friend, "for he has for years declined to see those more sib.*" "Kaium illa," said the planter as he strode up the steps, "I'll try;" knocked at the door and was admitted by an ancient butler, who took up his card and only brought back the message that the master did not receive visitors but he might have any refreshments he wanted "Then I do not want your refreshments," said the indignant dory as he walked out upon the lawn in high dudgeon; but scarcely had he got half down the avenue when the old appu overtook him—Gehasi-like—but only to say, "Please come back, master says he would like to see you, he did not notice you had come from afar." So back went the free and easy planter—had a long confab with the rich old Laird,—the burden however of which was a chest of tea the latter had purchased and with regard to which he was wishful to know if he had been overcharged. "By no means" was the verdict of the expert; "it is good tea, but we do nake better and I will send you a sample box when I return." A promise which fortunately he did not forget; for no sooner had he returned to the weary totum than he despatched a 40 lb. box of the best B. P. to Donside, which duly arrived while the old gentleman was swithering over his last will and testament, when—impulse of the moment—down went the name of the mindful giver of the tea, for the whole property:—a magnificent estate with £80,000 of accumulated funds!

Barely a year passed by when one day as the planter was sweating amongst his pluckers, up ran a coolie gasping, with a telegram in his hand, which telegram briefly intimated the death of the old Laird and the fact that he (the planter) had been left *sole heir*! "None of your practical jokes on me," said incredulous "Pekoe" as he rocketed the missive and thought little more about it. But next day came another and another cablegram from Aberdeen Agents asking for instructions, when it occurred to the planter that the Aberdeen lawyers were hardly likely to waste money on worthless jokes. So he wrote to his Colombo Agents to wire a reply and ask for particulars. When, sure enough the intimation was repeated: "All right, *sole heir*, the only condition being that he returns home, lives a decent life and invests the overplus capital in buying more land." Need I say that that tea totum had soon to seek

* Anglice = near-of-kin.

another periya doray and that our fortunate friend found his way to Donside without any undue delay. Never did a retired Indian more enjoy his *otium cum dig* and never did a district more appreciate good tea. Now the moral of this *absolutely true story* is,—never forget the smallest promise, and let each planting proprietor be as much as possible his own dispenser. Were it possible to approach and convince the august “Thirty Committee of Ceylon,” one year of the funds wasted on comic advertising, would enable every planter in the island to send boxes of tea to friends in every part of the world!

[What a lame conclusion to a romantic tale all the better for being true. Whoever heard of money being *wasted* on Advertising—comic or otherwise? Planters no doubt send plenty of boxes of tea as it is; but there are no more lairds swithering over wills to receive them like the one on Donside!—ED. T.A.]

AN OLD CRY:

WANTED A SCIENTIFIC AGRICULTURAL DEPARTMENT.

It is no new cry for us to take up, that of the need of a Scientific Agricultural Department; and that we are again referring to it, is for the object of bringing prominently before the Government what has been done elsewhere in the same line, and the happy results which have accrued therefrom. The failure of the sugar industry in the West Indies has been so widespread and so serious that after the report of a specially appointed Commission to inquire into the causes, the Imperial Government has decided to grant some relief, but in what form has not yet been specified. The bounties on beet sugar have all along been credited with the West Indian disaster, and it has been regarded as another instance of the few suffering for the benefit of the many. The masses have been able to get their sugar cheap, at the expense of the bounty-paying Governments. It is said, of course, that British planters have had to go to the wall; but the balance of advantage to the nation at large far outweighs the loss to the West Indian growers. We find that a journal so literary and metropolitan as the *London Spectator* has been discussing “Mr. Chamberlain and the West Indies,” in an article which we reproduce on our seventh page. On the causes of the West Indian collapse, our contemporary lets in considerable light, and it is rather startling to find him saying “We very much doubt, however, if the West Indian planters really know their business.” Tropical Agriculturists will, perhaps, open their eyes to find that the *Spectator*—the organ of the leisured and cultured classes at home—is coming out as an authority on sugarcrowing, but so it is! The West Indian planters are old-fashioned, and stick to their ancient methods of extracting the cane juice; and while nature has blessed them with the finest soil for sugar growth, they are now on their beam ends simply from want of scientific knowledge. While it takes 16 tons of cane to make 1 ton of sugar in St. Kitts, Egypt can do as well from 10 tons, Queensland from 9 tons and Hawaii from 8 tons, and the Egyptian and Queensland sugars are worth £3 a ton more in the world’s markets! Java, too, has been able to hold its own. The writer of the article under review, quotes from *The Sugar Cane* as follows:—“The Java planters, though heavily weighed by the low prices lately

current, and by the occurrence of a new disease which has done extensive damage, continue to hold their own, being greatly assisted by the capital chemical control of their factories, and the valuable information supplied by their experimental stations. Every possible advantage is secured to them in this manner, and their *enviable position is mainly due to their intelligent utilisation of all the hints that agricultural and chemical science are continually affording them.*”

The lines we put in italics contain the key to the success of the Dutch planters of Java. They have been handicapped in the same manner and to the same extent as the West Indian planter has been; but they have stood the strain, whereas the others have broken down. It is presumable that what Java could do, should be accomplished in Barbadoes which is “perhaps naturally the finest island under the sun for the growth of sugar”; but simply for want of agricultural and chemical science locally applied, is all but bankrupt. It is to be presumed that in time British colonists and tropical planters will wake up to the need of having the best scientific advice available for all kinds of tropical agriculture and in all tropical colonies, but necessary reforms of this kind are slowly evolved. Our home authorities have the courage to run a railway through a sparsely-populated and a lean, unhealthy land; although when approached for a specialist for such a thing as the cacao disease, they fail at first to find one. A thoroughly equipped Scientific Department, ready for every kind of agricultural investigation, would pay the country and the whole body of agriculturists (native as well as European) a great deal better than broad-gauge lines to the North, and the thing must come, if Ceylon is to keep in the forefront, and not to get into the same lamentable position as the West Indian islands named.

We have just been recording an American opinion in regard to the better quality in appearance and liquor of Java pekoes; and although, of course, we maintain that our island can match anything going in the way of teas, still a rival in the race may creep upon us, and our place may become second by-and-bye. Certainly the Dutch planters with their Experimental Gardens and Scientific Experts have a decided advantage over the Ceylon tea-grower, who has to find out pretty much for himself and often cannot find out, simply from want of scientific training. In every branch of tropical agriculture, there is always cropping up some surprises. To have at hand a reliable Department willing and able to investigate any agricultural question, would be the natural state of things in a colony whose whole property is bound up with the land; but we have got so used to do without it, and to wait until untoward events have become serious, instead of stamping them out to begin with, that this haphazard way is not only tolerated but regarded as the pathway of true wisdom. How far it is, however, from holding any such advanced position, let the present lesson from Java and the West Indies illustrate, and let it so come home to our rulers, that it may be as a word to the wise—to be acted on before it is too late.

COCONUT PLANTING IN KURUNEGALA DISTRICT.

KURUNEGALA, Feb. 23.—The weather is seasonable for this time of the year: hot and dry, and reaping and thrashing of paddy are in full swing. The outturn of crops will be fair. Rain will be

welcomed for plants planted out late last year, and I am inclined to think, we shall have it before long. A large acreage is going down this season for coconuts. The health of the people is good, but cattle are suffering from a disease, I don't quite understand; it is neither murrain, nor hoof and mouth disease. I have lost two animals, and I hear that many animals are down with it in this neighbourhood.

PULPING FRUIT.

Several correspondents have asked for information concerning the pulping of fruit. The Fruit Expert, Mr. W. J. Allen, reports:—The following is the method of pulping fruit in Mildura, where apricots and peaches are the principal fruits used, viz.:—The fruit is first pitted and put into a copper or cauldron, and a little water added (proportion—1 gallon of water to 3 cwt of fruit). It is then boiled for twenty minutes (i.e., twenty minutes from the time it starts boiling). Unripe fruit will require a little longer, and should the fruit be wvery it can be cooked without adding water. When first put it is stirred constantly to keep it from burning. After cooking it is put into tins and the tins soldered whilst hot. Occasionally the fruit is cooked in the tins, and when this is done the tins, after being filled and closed, are punctured and immersed in water to within, say, 2 inches of the top, or just so that the water will not boil over the top of the tin and get into the punctured hole. The fruit is cooked for twenty minutes, as explained, and the hot air is blown off through the hole. As soon as cooked the tins are sealed. Ten pound tins are the best when the fruit is cooked in this way, as the reaction draws in and disfigures larger ones. The fruit done in tins is not pulped or mashed to the same extent as that which is boiled and stirred in the cauldron.—*Agricultural Gazette*

COFFEE PLANTING IN CEYLON.

Mr. Frank Adam, largely interested in coffee planting in Java, who has been on a visit to our island since December last, leaves next week for India, and we trust that he may have a pleasant and profitable trip. Since our last interview he has visited the Nuwara Eliya, Kandapola and Dolosbage districts, and whilst he has been favourably impressed with the state of these he prefers not to express any opinion in regard to the tea industry as it may be judged from what he has seen in the course of his travels, as he considers that he has not been long enough in the country. With regard to coffee, Mr. Adam considers that bold coloury plantation sorts such as those of Ceylon and Java, which can only be cultivated on certain favoured grounds will always hold their own despite any drop that may occur in the price of coarse coffees such as Liberian, Brazil, &c. That had been demonstrated by the fact that in the London market recently some Ceylon Plantation Coffee was quoted at 15s whilst Liberian was quoted at 35s. His latest advices from Java were that notwithstanding the drop on the other side and the fact that the new crop would not begin to come in until March offers were being made for delivery in Java at 60 guilders per picul, crops of private estates W.I.P. coffee, that is about 97s 6d per cwt. in London. Private estate coffee from Java is assorted in four grades, viz., large, middle-size, small, and peaberry, as compared with five assortments from Ceylon, the additional one from Ceylon being extra large size. One thing that had struck him on going through Ceylon in 1894 compared with now was the

great increase in shade planting as seen on different estates. He thought that in Ceylon shade trees were in some respects even more important than in Java inasmuch as he observed a large area in 1894 deforested and carrying nothing but tea. In the event of an insect pest making its appearance it would on such deforested areas have nothing but tea to attack whereas shade trees would form an alternative object of attack; besides this shade trees served to attract birds, who are the foes of insect pests. Several planters had asked him his opinion as to the best kind of shade tree. His opinion distinctly was that the Dadap was the best shade tree. The Dadap however in some districts in Java had suffered from disease which had baffled the scientist so far and dried up the sap in the rees leaving a wilderness of skeletons. In such cases Java planters found it better to replant with Albizzia, the Moluccana variety being preferred. On some young coffee plantations in order to doubly safeguard the matter of shade it had been found advantageous to plant alongside of each other the Dadap cutting and Albizzia seedling. In the event of the Dadap failing the Albizzia is allowed to grow up in its place whereas should the Dadap strike well the Albizzia can be stumped. The grevillea is not very much used in Java. Whereas grevillea is a good alternative to Albizzia on a new plantation it has a tendency to grow up of a poplar and spindly character if planted on an old plantation to replace Dadap, the reason being that owing to the shade of the coffee trees which in Java are at a height of 5 ft. and higher, the young grevillea growing beneath the shade does not get the same amount of air and sun as it would on a new clearing alongside the coffee seedlings which it is later on intended it should shade.

RUBBER CULTIVATION.

The cultivation of Rubber is attracting a good deal of attention in the Malayan Peninsula, in Borneo and other far Eastern Lands. Mr. Ridley, of the Singapore Gardens, has compiled a valuable bulletin on the subject, and Mr. L. Wray, Curator in Perak, has come out with a second paper, supplemented by a "report on the tapping of the Para Rubber trees at Kuala Kangsar." All that is of essential value in these several papers we hope to include in detail in our future issues. But meantime, we may notice, that Mr. Wray is in favour of the "hering-bone" method of tapping, with lateral and vertical cuts, but not to meet each other. He quotes Dr. Trimen, Dr. G. Watt, and Mr. J. C. Willis.—From the Kuala Kangsar Report of Mr. Derry, Superintendent of the Government Gardens, we quote at once some very practical and interesting remarks:—

I would particularly point out that the experiments have not been conducted to test how much each tree would yield, for the reason that these trees are of much greater value to the Government at the present time as seed bearers than rubber producers; as an instance of this I would mention that applications for 70,000 seeds have been received for the current year (of which 25,000 have been supplied) and an application filed for 100,000 seeds next year. The Para rubber trees (*Hevea brasiliensis*) at Kuala Kangsar were first tapped during the month of August, and the work has been proceeding up to the present time. The frequent wet days have delayed the work considerably. At the end of October, 60 trees had been tapped and 88 pounds of dry marketable rubber prepared. Most of the trees tapped were six years old, and from these trees an average of 10 ounces of dry rubber has been obtained.

A few trees, twelve years old, produced 3 pounds each, but in no instance were the tappings exhaustive. Two samples have been sent to Mincing Lane for opinion and valuation.

TAPPING.—The trees were tapped with almost V-shaped cuts, a few inches apart, with a channel down the centre from the lower branches to the base. An ordinary pruning knife was used to make the first cuts, and about a quarter of an inch of the outer bark removed, care being taken not to cut too deeply. So soon as this commenced to callus, which varies from two to several days, the edges of the cuts were lightly shaved with a very sharp chisel every day, with an occasional interval, until the decided quantity had been exuded. The rubber was collected in locally made tin boxes, 6 inches by 4 inches by 2 inches, nailed at the base of the tree, with the lid partially opened so as to prevent wet or dirt from falling in. When full this was allowed to dry, and the water pressed out (a pinch of salt appears to expedite the coagulation), and then kept in smoke for about a week to prevent mildew.

TIME OF TAPPING.—Para rubber has a short resting season, when most of the leaves fall off. The flowers usually appear first, and when the tree is in full foliage tapping can be commenced and carried on with different trees until again deciduous. The first cuts can be made at any time of the day, and may be left for weeks in the event of exceptionally wet weather, but the subsequent tappings should always be done in the evening as the rubber soon ceases to exude with the influence of the sun.

COFFEE IN HAWAII.

A British consular report on Coffee Culture in the Hawaii islands gives a very fair account of cultivation, but nothing specially new. The estimates, however, are worth referring to. They include the purchase of 100 acres of Government land at 10 dollars (say £2) per acre :—

	Dollars.
Outlay, 1st year =	6,955
2nd year	3,080
3rd year	5,070

	15,105
By 20,000 lb. (below 2cwt. per acre) of coffee at 18 cwt.	3,600

	11,505
Outlay, 4th year	6,220

	17,725
By 60,000 lb. coffee	10,800

	6,925
Outlay, 5th year	7,570

	14,495
By 85,000 lb. coffee	15,300

	29,800

Credit at the end of 5 years .. 805

We then get an outlay in the sixth year of 8,820 dollars and a credit of 100,000 lb. of coffee equal to 18,000 dollars, and in the seventh year the crop is 125,000 lb. against the following outlay :—

	Dollars.
Manager's salary	1,200
Labour, 12 Japanese	2,160
Picking, pulping, and drying 125,000 lb. of coffee, at 4 c.	5,000
Hulling, polishing, and grading 125,000 lb., at 1 c.	1,250
Sundries : bags, freight, etc.	1,200

	10,810

The result after 7 years is a balance to credit of 21,675 dollars, (not counting interest) and of course a valuable property.

THE JAVA COFFEE CROP.

The first Government estimate for the growing Java crop is 128,000 piculs, against 490,000 piculs this season. The new Private crop is estimated at 190,000 piculs, against 500,000 piculs.

The duty payments and deliveries of coffee in the Zollverein in 1897 were 135,790 tons, against 129,900 tons in 1896; in Holland, 73,476 tons, against 67,117 tons in 1896.—*American Grocer.*

PLANTING NOTES.

THE SAN JOSE SCALE.—We (London Times) learn from the *Deutsche Landwirtschafts-Zeitung* that the German Minister of Agriculture is taking active measures with regard to the possible infestation of furit-trees by the San Jose "Schildlaus." A small committee of well-known entomologists and botanists has been appointed to investigate the matter, and steps are being taken to render fruit-growers and other cultivators familiar with the appearance and the life-history of the dreaded *Aspidiotus perniciosus*.

COFFEE IN INDIA seems doomed, though it is fighting bravely against heavy odds. An Indian contemporary says:—The coffee crops just gathered in the Ochterlony Valley and in South Wynaad are lamentably poor, and are said to be the worst on record. No estate has yielded anything like an average crop. Planters are hopeful and are already looking forward to the present year's yield, which promises to be good should the early spring showers fall at the right time.

CEYLON TEA COMPANIES—An interesting article from the *Financial News* on this subject is quoted in our daily columns. It deals with the steady increase in the consumption of Ceylon tea and shows by figures how it continues to be one of the most distinct features of the tea trade. Ceylon tea is considered to be at present one of the best investments on the market and in proof of this statistics of dividends are given; but only of a few of the most flourishing Companies.

PLANTING IN BADULLA.—In another column we give some interesting notes on this subject from a correspondent. The low price of tea and the high price of rice we touched upon, the statement being made in regard to the latter topic that so far as the writer can see there is no reason why a greater proportion of the food stuffs which are daily consumed should not be grown by the labourers themselves. Our correspondent also considers it folly to construct the railway to the North on the 5 ft. 6 in. gauge.

THE LARGEST COFFEE ESTATE IN BRAZIL comprises 110,000 acres of which 13,000 are planted with coffee, and 20,000 more are suitable for coffee trees. It was sold recently for \$5,838,000. The trees in bearing rose from 1,300,000 in 1892 to 2,096,500 in 1895. The profit in 1895 was \$637,000; the estimated profit for 1896 is set at \$711,000. The total number of trees in this plantation was, in June 1896, 4,426,604, of various ages, and it is estimated that two-thirds of the trees being new, from 1897 onwards, an average harvest of 100,000 bags (13,200,000 pounds) may be expected, and that, in three or four years, the yield may increase to 250,000 bags or about 32,500,000 pounds per annum. The next largest estate in Brazil is of 9,785 acres, with 1,800,000 trees, populated by nine colonies with 260 families, furnishing some 1,500 laborers. There are several other plantations on which grow more than 1,000,000 coffee trees.—*Planter's Monthly.*

SCIENTIFIC MANURING.

We observe that our old friend, Mr. John Hughes has been writing a letter to the Church of England *Guardian*, on the subject of the very article on which we made some observations in our issue of the 28th ultimo. The counsel of the experienced Analytical Chemist is much on the same lines we followed, and he does not withhold commendation of the article which struck us as very guarded and judicious. He points out that it is very unusual to apply cattle manure and artificials combined; and he indicates the value of the latter for spring crops. While doing so, he is very emphatic in his refusal to discredit well-rotted cattle manure, and points to the conditions which must decide on the value and utility of manures. As truly remarked, agriculture is not a Science but an Art; and the successful agriculturist is the man who is most patient, observant, and calls in the aid of science at the proper time. Here is what Mr. Hughes writes:—

"The interesting and very practical criticism of recent manuring experiments which appeared in the *Guardian* of December 22nd, must have been read by many country clergymen with a personal interest, because their prosperity is closely associated with that of agriculture. In many cases the parson is a very good farmer himself, and his previous education and ability of assimilating special technical knowledge enables him to progress with the times to a much greater extent than the average farmer, who has been brought up in the immediate locality, and has, perhaps, never travelled beyond his own county.

"It may be useful, therefore, to state that artificial manures are not usually applied in conjunction with farm-yard dung; indeed, the special value of such concentrated manures is that the industrious and enterprising farmer is enabled by their use to supplement and extend the average of land manured in one year, because no farmer, whether upon arable or grass land, has sufficient ordinary dung to dress the whole of the land that requires it. Moreover, these special fertilisers, containing the necessary elements of plant food in a generally soluble form, are therefore, immediately available for the use of spring crops, so that, under ordinary circumstances, the farmer who gets his artificials from a respectable firm may reap an increased crop before he pays for the dressing in the following autumn. But these fertilisers should be judiciously employed, after taking proper advice; otherwise the results may be just as unsatisfactory as the German pot experiments with cow and horse dung have been shown to have been, though it is rather too late to be induced to believe that *well rotten* dung, whether made in Germany or elsewhere, is not a reliable manure. Agriculture after all is not a science, but an Art founded upon long experience.

"The conditions which cause it to flourish or to fail are *not fixed*, nor under the control of man. *Soil, season, situation, seed*, and the personal *skill* of the farmer in the management of his workmen, his crops, his herds are the great and chief factors that affect the success of the ordinary farmer.

"Science, of course, is in capable hands and if locally available in the nearest market town can materially assist the farmer in the purchase of his fertilisers and feeding stuffs, in the selection of good seed, in the treatment of his stock, and in pointing out with the aid of analyses in what respects his soil may be specially deficient.

"Field experiments, carried out by the farmer himself, will give him, after a series of years, some useful information in regard to his own *particular* form; but it will not be safe for him to assume that experiments carried out in other localities, upon probably, very different soils, are likely, under a totally different season, to yield similar results on his form. It is important that these facts should be remembered; for in these days the agricultural press is constantly reporting the results of field experiments carried out in various parts of the country.—JOHN HUGHES, F.I.C., District Agricultural Analyst for Herefordshire."

PLANTING NOTES.

"THE AGRICULTURAL LEDGER."—1897—No. 19. *Acotium A. Ferox*, var. *Crassicaulis*, and *A. Napellus*, (the Roots). Dictionary of Economic Products, Vol. I., A. 397-413.

HIGH PRICES FOR COFFEE.—Middling Plantation Ceylon coffee realized in February 1874 in London as high as from 135s to 139s per cwt. Choice "Peaberry" would certainly secure a good deal more. Indeed "Peaberry" often gets a fancy price above the ordinary market. But it is very notable that so old an Uva coffee estate as Mousagalla—we saw the first clearing we think in 1865 when on a visit to old Thomas Wood of Spring Valley—should realize for its Peaberry in 1898 so high a figure as 150s per cwt. (when Middling Plantation Ceylon is down to 103s), Would that Uva could show an appreciable area still flourishing under the old staple!

"THE INDIAN FORESTER," a monthly Magazine of Forestry, Agriculture, Shikar and Travel. Edited by J. S. Gamble, M.A., F.L.S. Conservator of Forests, and Director of the Forest School, Dehra-Dun. Contents for February 1898, are as follows:—Original Articles and Translations: Note on the Forest School tour in Oudh. No. 1, by F. Gleadow; The effects of fire on grazing and the production of grass, by "X"; Note on a White Ant preventive, by Gokal Das; Willow for Cricket Bats, by B. U. C." Correspondence: Concentric Rings in the Mangrove, letter from A. W. Lushington; An Imperial Forest Blazer, letter from "Nil Desperandum." Official Papers and Intelligence: Note on the Fructification of *Deodar* by B. Ribbentrop; Reproduction of Teak by means of Taungyas, by ditto. Reviews: Forest Conservancy in Ceylon during 1896. Shikar and Travel; Extracts, Notes, and Queries; Timber and Produce Trade; Extracts from Official Gazettes; Appendix Report on the Manufacture of Spirits of Turpentine and Colophony by J. L. Pigot.

BIRD-EATING SPIDERS IN CEYLON.—"Smooth-bore" writes to the *Field* of Feb. 12th:—"Referring to Mr. William Hardy's note as to the spider he found eating a bird on his estate in Ceylon, it may be useful to note that there are two species of *Pæcilotheria* or "embroidered" spiders in Ceylon, and not found, so far, either in India or Burma. *Pæcilotheria sub-fusca* has the first segment next the body of the first and second pair of legs (the femur) entirely velvety, black or brown in the lower or ventral aspect, and has no colouring; whilst *P. fasciata* has the same segment lemon yellow, with a narrow black stripe across it. Mr. Hardy is the first observer who has recorded the fact that one of these spiders is a bird eater. The natives state that they do eat birds; but to the best of my remembrance Sir Emerson Tenant was unable to confirm the statement. I hope that the description I had given will enable Mr. Hardy to identify the species of spider mentioned in his note."

COFFEE PLANTING IN BRAZIL.

(From our own Correspondent.)

Rio de Janeiro, 11th Jan. 1898.

Since I wrote you last the price of Brazilian coffee has risen a little in New York. The end of November No. 7 was 6½ cts. per lb. at 10th December it was 6½ cts. at which figure it has remained for the rest of the month. The question arises can

COFFEE PLANTING IN BRAZIL.

pay at these low prices? We must consider that exchange or the gold value of Brazilian currency is a strong factor in the case. Labourers' wages (paid in currency), do not rise and fall with exchange; but the amount in currency which the planter receives for his coffee is larger when exchange is low. Planters always calculate their coffee by the arroba—or 15 kilos. Coffee was understood to pay at seven milreis per arroba, when exchange was at 24d per milreis or even at par 27d per milreis. Even with these low prices in New York, the price in Rio has seldom been below twelve milreis per arroba for the last twelve months. Exchange was at 8d for the first half of 1897, and 7½d the last half. With exchange now (in December) at seven pence coffee No. 7 is selling in Rio at twelve mill two hundred reis per arroba. The planter is thus receiving in currency 80 per cent above what was formerly considered the paying limit, while the cost of production and transport has not risen 50 per cent. The low value of currency though, has effected very much the price of labour in towns and on public works—where all necessities have to be imported and therefore paid in gold—but on the plantations where the colonist-labourer produces his own food on the ground allotted to him by the planter, he consumes the imported article only in the shape of clothes and luxuries. Those planters, however, who do not work on the colonist system, but by days labour have to pay double what it cost them formerly in currency. By days' labourer the production of food stuffs—even at the enhanced price to be paid for imported food—cannot be made to pay. Rice comes from Rangoon and Siam, other cereals from the river Plate. Beef comes also from the latter place, and the United States sends lard and flour and all these have to be paid for in gold.

It is long since the

SAO PAULO PLANTER

found out that the colonist system of labour was the cheapest. For that State—Sao Paulo—alone more than 60,000 principally Italians have been introduced every year for the last ten years: 1896—74,000; 1895—104,000 in round numbers are the official figures. I have not time to go into the calculation which the figures as to price of coffee, exchange, and colonist labour suggest; but it will be seen that although the price of coffee in consuming countries has fallen considerably—and small prospect of a rise while Brazil continues to give enormous crops—capital judiciously invested in coffee property in Brazil is safe enough if in good managing hands.

The present Government seems in earnest to try and stop the

ANNUAL DEFICITS

and reduce expenditure, but it is a long way from seven (7d) pence—the present rate of exchange—to the par of twenty-seven pence (27d) per milreis. Every one expects that with a rise in exchange there will be a rise in the price of coffee. The present low prices cannot continue, consumption will increase. Comparing the gold price of plantation labour with that of other countries—Ceylon and India for example—in Brazil it is about four times more, but with all this owing to the system of cultivation or rather want of cultivation adopted, the production of coffee is not more expensive, than in other countries.

The system formerly in use in Ceylon of

PLANTING

is 6 feet by 6 feet, cutting down the tree and keeping it down to 3½ or 4 feet, the two handlings, and one

knife pruning per year, costing a vast number of days' labour, would never pay in Brazil. Weeding must be done in all countries and under any system of cultivation. The five weedings a year in Brazil, costs five times more than your monthly weedings in Ceylon. Then as regards the

GATHERING AND CURING OF THE FRUIT,

there is a vast difference the Ceylon system of picking consisted in picking only such fruit as was fresh and ripe, and the trees were gone over four or five times during one picking season, and the cherry skin was separated from the bean the evening of the day the fruit was gathered. The beautiful white parchment was dried with three days' sun, and a pretty clean sample was shown after the parchment and silver skin were taken off. How different in Brazil! Trees are planted 12 feet by 12 feet. Thanks to superior soil and a suitable climate, they grow up, spreading their branches out, towards the light to a height of 12 feet, each tree like a bunch of growing bamboos. Immediately before the gathering season commences, the ground is weeded clean and left in a hard swept surface under the trees, this prevents the over ripe berries which fall, from growing, but the season being dry all during the picking time, the beans have not a tendency to sprout. After part of the cherries are dry on the trees, another part are fresh and ripe, and a small proportion are still grown, the men, women and children of the colonist's family, with long hooked sticks pull down the branches, and strip the secondaries of all that is on them, not respecting always the leaves. All goes to the ground on the clean surface, above referred to. The fruit is gathered up passed through a wire sieve, which removes earth, while sticks and stones are picked out by hand. Cart roads are plentifully made through the plantations, where the cherry is heaped—each colonist having his own heap. The mule-carts come round several times during the day, when the coffee is measured and put into sacks, and the quantity entered in the colonist's pass-book.

CURING

is a very simple matter: most of the drying grounds, are of earth, but a few are of mortar, and cement, some are of flat bricks, but all are beside the machinery house, and stores. Large stores are not required if the estate is near a railway. The coffee lies on these drying grounds for about a month, being turned occasionally by the workmen's feet, and put up in small heaps when there are signs of a shower. Only heavy rains do damage by washing the coffee off the drying ground—but this happens towards the end of the season, and on badly formed ground. When dry enough to pass through the huller without clogging, the cherry is washed by passing down a wooden sluice-spout, ending in a large trough with wire bottom. The earth and stones collect in the spout, and the dry coffee floats down, sticks are caught by hand while floating down. It is raked from the trough into baskets—the workman protecting his shoulders by a gunny sack—and spread out on a clean drying ground, for the last time. A day of sunshine makes it brittle and crisp for entering into the hulling machine. There are several kinds of hullers and different sets of cleaning machinery, but in nearly all the arrangements are such that the dried cherry goes in at the hopper of the huller—"Descascador" they call it—passes through fans and sizers, and is received in sacks, and weighed, when it is ready for transport to the nearest railway station, *en route* for Rio de Janeiro or Santos, to be sold in the country. On very few estates in Brazil is there water enough to drive machinery, indeed in the famous Ribeirao Preto district there are many very fine plantations which have not water enough to wash the coffee in the manner I have described above. In these cases inventive genius has supplied machinery for separating sticks and stones, before the dried cherry passes through the huller or "Descascador". You will think this system of picking is very hard on the trees, but judging from the manner they send out young wood and leaves after the first shower, the damage does

not seem to be much. After a long dry crop season the first rains send out flowers all over; dry secondaries, primaries, and even stems, send out their flower buds. The same rule applies in Brazil as in Ceylon—an old coffee tree say above ten years will not give a heavy crop twice in succession. In the State of Sao Paulo, should the old trees bear little any one year, the regular or increase of quantity is made up by many young clearings coming into bearing.

A great deal of energy and money have been spent in trying the Ceylon mode of *curi* g in Brazil. If Brazilian coffee were amongst the sixties, instead of Santos good average selling from twenty-seven to thirty-two shillings per cwt. (*vide* Knowles and Foster's report, 16th Dec. 1897) I believe from fifteen to twenty shillings per cwt. more could be got for it and this would go a long way to cover the extra expense in gathering the fresh cherry. The unsuitableness of the labour system, and partly the thinness of the cherry skin, with a very small layer of saccharine matter adhering to it, have hitherto been objections. The first can be remedied by an increased supply of cheaper labour, and with exerting patience in teaching the proper mode of picking, and the second by improving the Ceylon Coffee Pulper to suit such thin-skinned cherry.

In the time of Slavery—before 1888—a great deal of Coffee in the Province of Rio de Janeiro was sold as "washed" coffee. This had undergone the pulping—or what was more appropriately called here "dispulping"—process, and was washed and dried in the parchment. It always sold much higher than the other. To increase the saccharine matter in the cherry it was always kept in water cisterns for twelve hours before *dispulping*.

COFFEE BEGINS TO RIPEN

in the State of Sao Paulo, end of March, and the first picking of fresh cherry would take place beginning of April. This is just the time the colonist, his wife, and children are securing their crops of rice, beans, Indian corn, potatoes, &c., for the year's consumption. There would be small straggling pickings until July, when the larger part of the crop ripens, and there would be small pickings after that until middle of September. The usual form of colonists' contract would not admit of this. By the present system the colonist commences picking in June, or the day after Sao Joao (St. John)—which is 24th of June—the trees are gone over only once, in the manner above described, and generally all is secured before the September rains set in. The good colonist is anxious to get over the crop picking quickly, for he has his ground to prepare for planting corn, beans, rice and potatoes, before these same rains cease. The coffee tree has thus a rest before the principal blossoming time—the middle of October.

THE PICKING

difficulty could be overcome by the introduction of Japanese labour. The Brazilian Government have a treaty with that of Japan, which allows these labourers to be imported. The "Japan Emigration Company," composed of bankers, capitalists and merchants in Japan, have appointed as their agents in Brazil Messrs. A. Fiorita & Co., ship-brokers and Government contractors for European immigrants, having offices in Rio de Janeiro and other ports. These have lately issued a prospectus showing the advantages of such immigration and the rates of pay and passage-money which the planter will have to contract for. If they may not be cheaper than European colonists—the Government having hitherto paid passages and all expenses of the latter up to collocation on the plantation—they will be more tractable as they work in gangs, and their work can be depended on for the time of their engagement. Here is what they will cost the planter, and it must be paid in gold or its equivalent:—

Passage money, £14 each	..	£ 14
Wages, 17 dollars a month, gold, 3 years	..	126
Return passage, should he elect to return	..	10

		£150

or £50 a year. They feed and clothe themselves, but are allowed house, water and firewood. The contract is for three years, each immigrant is submitted to a medical examination before leaving Japan and certificate of health given. If on arrival he is incapable of working the advance given by the planter is repaid. If he runs away during the time of contract, part of the passage money will be repaid in proportion to the time he has worked. If the immigrant elects to remain in the country the planter has not to pay the £10 for return passage. The advantages are that the planter can be able to plant other things besides coffee, that will help to pay for the extra wages the Japanese labourer requires.

The ground given to

EUROPEAN COLONISTS.

to plant on, is low-lying ground subject to frost in the cold months, and not suitable for coffee planting, although it could grow all the cereals the colonist requires to plant, and these same lands could be utilised to produce by Japanese labour not only these cereals for which there is a good market but sugar cane and cotton. The first cost of establishing colonist labour, comes very heavy on the planter. The Government tries to relieve it by paying the passage and all expenses of the colonist family up to the time of collocation on the estates. The recruiting in Europe and steamer passage being arranged by contract with Italian shipping agencies, the colonist arrives at the Government Depot free to contract himself as he chooses. This certainly saves the planter a large sum. Those planters who struggled for the first ten or fifteen years to introduce European labourers were not thus relieved, but this served as a sop to the *Fazendeiro* for relieving him of his slaves. The houses for the families to live in have to be built by the planter, and large pastures planted with perennial grasses, and strongly fenced to keep hungry cows, and horses, from breaking through when the dry weather dries up the grass. A cow is a necessity to each family and the colonist is not long in the country before he buys a horse also. The houses are generally built in sets of two, each thirty feet by thirty inside. The house must be covered with tiles, have two doors and two or more windows. The wealthy planter makes the walls of brick or stone, but a great many have walls of weather boarding. The corn store, the pig and cow-houses are made by the colonist—and the dwelling house he is allowed to divide into rooms to suit himself.

A set of two colonists' families' houses will cost £100 or £50 for family. To make a good well fenced pasture will not cost less than £10 per family. This expenditure—of £10—a family—may be called reproductive, and it is an improvement to the estate. As soon as the colonist arrives on the estate, he gets an advance of money to buy a cow, a stock of pigs (young ones) and soon after—when the season comes—another advance to buy seed to plant his patch of ground. Food must be supplied from the estate store but charged to his account to keep him and his family until he has produced food stuffs for himself. Somehow the colonist very soon supplies himself—from these advances—with a gun, powder and shot, and some musical instrument.

The good colonist pays off these advances in two years; the indifferent may have still something to his debit at the end of his five years' contract, and the bad may take a "moonlight flitting," and the utterly worthless have to be got rid of, at any cost, or at any loss.

These advances may amount to £80 or £100 by the end of the year. A regular debtor and creditor account is kept for each colonist. This is balanced at the end of crop season. If the colonist is owing anything, it is carried forward to next season, and if the balance is in his favour he is at once paid in cash.

The colonist's contract is generally for five years. Not all have the same system of remunerating the colonist. Some are on the half and half system, that is half the cherry coffee goes to the colonist and half to the proprietor, but the latter takes all for curing and cleaning. Others pay so much per 50

litres of cherry picked by the colonist, the latter giving five weedings as well as the gathering for that fixed amount. The first mode is unsatisfactory, because of the difficulty of adjusting accounts. The second equally so, because some years the crop is small and does not satisfy the colonist, and when he sees he has little to receive at the end of the year he shirks his weedings. The mode which many have adopted, and which works more smoothly, is to give a fixed sum for the five weedings, and another for the quantity of cherry picked. The price for the weedings is 80 millreis per thousand trees which at exchange of 10d per millreis would be about twenty four shillings of sterling money per acre, and for picking one millreis or ten pence per 50 litres or about 1½ bushels of cherry—about the size of your cherry-box of which the task per cooly used to be two pence per day. This system always leaves the planter in a difficulty as to labourers for working for the drying-ground, the machine-house, and cartmen, cattlemen, &c.

These

DAY LABOURERS

are generally found from a vagabond sort of class, native Brazilians with a good deal of coloured blood in them, and freed slaves, a very difficult class of people to manage. Their pay is three millreis to three mill five hundred reis per day—equal at 10d exchange—to two shillings and sixpence to three shillings per day. These can only be got by paying a large advance to clear them from their former employer, and if a disagreeable word is said to him he leaves without any thought of paying what he owes; sometimes the advance is got from his next employer, but in many cases the planter loses it entirely.

The introduction of

JAPANESE

even at the high rates mentioned above would be a good substitute for these and it ought to have a fair trial. I may mention that since the introduction of European families on a large scale, many of the young unmarried men work as day labourers, but they soon get into the careless habits of the Brazilian working only when it suits him, observes church and national holidays religiously, loses one day before each in capturing his horse and cleaning him, and one day after because he is tired, and however pressing the planter's work may be, he has to endure it, and practise that most important virtue *paciencia*. Happy is he who possesses that in a high degree.

With all this unsatisfactory system of working, coffee-planting in Brazil, has paid well for many years, and even with large stocks in the consuming centres and consequent low prices, there is no reason to apprehend that capital judiciously invested in coffee property is anything else but safe. With all the fluctuations in exchange and the steady lowering of the value of paper money, coffee properties have kept their value in gold. Rents of houses in towns have more than tripled. He who has lost greatly is the careful man who has deposited his money to be repaid in currency. The poor man who has been "laying bye for a rainy day" the foreign commercial or railway employée, who looked on the savings from his large salary to visit his native country he finds his passage ticket requires nearly four times as much in currency as formerly, and if he turns the rest of his savings into gold he finds he has more than two-thirds less than he ought to have had. The Commercial house which has not tripled its capital representative in currency has been losing. British Exchange Banks have all paid well during the last ten years, but their cash balances and other accounts are represented by very much larger sums than formerly taken in currency. With all this there is no need to fear that things are without a remedy. Brazil is a large country, its resources are enormous, to use Mr. Chamberlain's phrase "it is a large undeveloped estate." By abstention from party strife, and conscientious and honest administration of public affairs, by not allowing the expenditure to exceed the income and by an honest attempt to set aside part of the revenue, to replace by gold and silver the en-

ormous accumulation of paper money, Brazil will yet become a great country. There are many men amongst them of great ability and good education, but in public affairs the real interests of the country have to give way to party, and paid patriotism is of the worst kind sickens and pollutes public life. I have not left room to enter into other topics which I intended to, when I began this epistle; but must leave them for a future occasion.

Wishing you and the "old rag" a happy and prosperous New Year, I close this long rignarole of a letter.

A. SCOTT BLACKLAW.

PLANTING NOTES.

PAWPAW JUICE.—The pawpaw juice mentioned by Mr. J. F. Bailey in his article on the Pawpaw (*Queenland Agricultural Journal*, Volume I, Part 3) as being worth 10s per lb. in London, is now quoted at five shillings per lb., and is easily obtained from the unripe fruit. The *Chemist and Druggist* gives the following as the best method of preparing it:—The juice is pressed out of the fruit, clarified by filtration through a twill bag, and the ferment precipitated by alcohol. It is then dried, but is sometimes purified by treatment with water.—*Queensland Agricultural Journal*, for February.

"THE QUEENSLAND AGRICULTURAL JOURNAL."—Vol. II, Part 2, February 1898. Contents:—The Wheat Crop of 1897; Co-operative Bacon Factories; Agriculture—To Keep Sweet Potatoes; Wheat-growing by Irrigation at Barcardine; Wheat-growing at Roma; Dentition of Sheep; Directions for Curing Heavy Pipe and Export Tobaccos. R. S. Nevill; Notes on Silos and Silage; On Cross-breeding. P. R. Gordon; Dairying; Horse-breeding; Poultry; The Orchard—Propagation of Fruit Trees. A. H. Benson; Viticulture—Fermentation of Dust. E. H. Rainford; Appointment of a Viticulturist; Botany—Contributions to the Queensland Flora. F. M. Bailey, F. L. S.; Plants Reputed Poisonous to Stock. Ditto; Popular Botany—Our Botanic Gardens, No. 3; Seeds for Exchange, with Short Descriptive Notes; Apiculture—Beekeeping; Wax-extracting; Horticulture—Perfume-making as an Adjunct to Horticulture; Tropical Industries—Picking Coffee; Coffee at Landsborough; Coffee Cultivation in Brazil; Ramie Fibre Experiments in New South Wales; Ramie Fibre—An English Manufacturer's Opinion; Entomology—The Dissemination of Yeasts by Insects; Pisciculture—The Giant Perch; Forestry—Forest Conservancy—Part 3. A. J. Boyd; The Markets—Average Prices for December: Farm and Garden Notes for February; Orchard Notes for February; Public Announcements.

DURIAN IN THE WEST INDIES.—The well-known Durian tree of the Indian Archipelago (*Durio Zibithinus*, L.) has been successfully introduced to the Botanic Gardens, in the West Indies, but hitherto it has not fruited anywhere except at Dominica. In 1895, and again this year fruits have been produced by a tree growing in the garden of Dr. H. A. Alford Nicholls, C.M.G., at St. Arment. This was originally received from Kew with numerous other plants sent out to the late Dr. Inray and to Dr. Nicholls, in exchange for Dominica plants, contributed at the private expense of the two gentlemen above mentioned. Reference is made to the St. Arment Garden in the *Kew Bulletin* for 1887, June, pp. 9-10; and a list of the economic plants already established there was given in the *Bulletin* for July of the same year, pp. 10-12. It is gratifying to find that all the seeds saved from the Durian fruits so far produced have been placed by Dr. Nicholls at the disposal of the Botanic Station at Dominica, in order that plants may be raised for distribution to other parts of the Western tropics. One fruit was lately received at Kew, but, unfortunately, it did not arrive in good condition. Those interested in the subject may see a fine plant of Durian, about fifteen feet high, in the Palm House, where it has been established for about fifteen years, but so far has not flowered.—*Kew Bulletin* for November 1897.

DUTCH (JAVA) PUBLICATIONS.—We are indebted to Messrs. G. Kolff & Co., the well-known publishers at Batavia for two handy little publications in Dutch—(1) “Assam-Thee. Haar Culture ten Beroeping op Java Door Ch Van der Moore”—an evidence (in its 109 pages, if such were required, of how the general interest in tea cultivation is spreading in Java. The next is rather different:—“Uit Oud-Batavia: De Portingeesche Buitenkerk door Dr. F. de Haan, Uitgegeven Ten Bate van een fonds tot het Restaureeren dier kerk”—an extremely neatly got up brochure with an engraving of an old picture of a place of worship and people entering.

“THE AGRICULTURAL GAZETTE” of New South Wales, Volume IX. Part 1, has the following contents for January 1898:—Wine-making—Fermentation; Useful Australian Plants; No. 49.—The Pigmy Panic Grass (*Panicum pygmaeum*, R. Br.); No. 50;—The Stringybarks of New South Wales; Botanical Notes—Fruit-tree and Vine Pests; Comboyne Brush Bees, and How to manage them, Part I.; Fowls for Profit; Export of Oranges; The Improvement of N. S. Wales Stock; Ensilage up to Date; Bee Calendar for February; Orchard Notes; Practical Vegetable and Flower Growing; General Notes; Replies to Correspondents; List of Agricultural Societies’ Shows for 1898; Label for Specimens.

MAURITIUS is not to be behind Barbadoes or any of the West Indian islands; for, in Governor Sir Charles Bruce’s “Council of Government,” on 21st December last—the full report has only just reached us in Port Louis papers of Jan. 29th—the Hon. H. Leclezio after a long speech moved and carried the following resolution:—

“The Council of Government join with the Chamber of Agriculture in the resolutions voted at its meeting of the 13th December instant, and beg that His Excellency the Governor be pleased to give them his support and to forward them to the Right Honorable the Secretary of State for the Colonies for his favourable consideration.

“The immediate measure of relief prayed for will largely contribute to keep up the Sugar Industry of the Colony which is now threatened with extinction.

“The Council think that the sum of £400,000 will be sufficient to meet the objects of the Chamber of Agriculture.

“The Council are also of opinion that, with the view of protecting the agriculture of the Colony against the effects of the frequently recurring droughts which visit it, and with the view of improving the sanitary condition of the Island the re-forestation thereof be completed, and they recommend for that purpose that His Excellency the Governor be pleased to move the Secretary of State for his sanction to add the sum of £100,000 to the above loan to be applied to the re-forestation scheme of the Colony.”

The Sugar Industry of Mauritius would be all right if an “honest rupee” was observed—so Mr. Chamberlain has good reason both in the interests of Ceylon and Mauritius to withstand the policy of the India Office and to support the appeal from producers in the East led by the United Planters’ Association of India. Mr. Leclezio concludes his speech as follows:—

No man understands better the wants of the Colonies than Mr. Chamberlain. It is well known that he himself selected the Post of Secretary for the Colonies in order to devote his great abilities and energy to their progress and expansion and to strengthen the bonds of Union between them and the Mother country. What he has already done has proved his desire to promote the welfare of those Colonies. We may therefore trust that an appeal to him will not be made in vain; that the British Government will consent to guarantee that Loan and, that their generous assistance will enable this Colony to maintain its past honour, to be saved from ruin and to remain a not unworthy jewel to the British Crown.

THE CONSERVATORS OF FORESTS.—Mr. J. A. Broun, writes to the *Madras Times* denying the truth of the report that his brother Mr. A. F. Broun, Conservator of Forests, Ceylon, was wounded by him and had to apply for an extension of leave. These facts are entirely incorrect, he adds:—“Mr. A. F. Broun was *not* wounded by me, nor did he apply for an extension of leave. He was granted the leave which he applied for before leaving Ceylon. Had the “Ceylon Standard taken the trouble of writing either to my brother or to myself before publishing this untrue report they would have saved themselves the necessity of cancelling it.”

THE PEARL FISHERY OF CONWAY—says Sir Walter Besant—seems to interest many readers, if one may judge from the letters received. The following information, the last I can promise on the subject, will enable everybody to go off fishing for themselves. There are two kinds of mussels found in the Conway river. The first, which is rare, is 5½ inches long by 2½ inches broad. The pearl found in this kind is said to be very fine, and in size and quality not inferior to the Oriental pearl. The other kind is much smaller; it is found in great quantities on the bar of the river, where it used to be gathered by the sackful at low tide. The sacks were then carried to a place where great iron pots filled with water were hung up over fires. Here the mussels were boiled. The fish were then taken out and put into a tub, where they were stamped with bare feet till they were reduced to pulp; water was then poured in; the animal matter floated, the sand and pearls sank to the bottom; when the pearls had been collected they were sold to buyers in the trade at a price varying from eighteen pence to three shillings an ounce. Nobody, it is added, ever knew what became of these pearls.

TEA BULKING.—Mr. J. Buckingham, C.I.E., Chairman of the Assam Branch, Indian Tea Association, has addressed an important communication to the Calcutta Association on this subject, embodying the views of the Assam planters and what they think of bulking. The *Indian Planters’ Gazette* tells us:—

Mr. Buckingham sums up the advantages of bulking in India as follows:—(1) Saving of time in London in bringing tea to market; (2) Saving of warehouse charges to the extent of about 1s per chest says £73,000; (3) Prevention of risk of damage to leaf through bulking in England; (4) Less liability to loss in weight, test packages only being weighed; (5) The superior condition in which the packages reach the buyer, estimating at 1 farthing per pound only, would be equivalent to over £150,000; and (6) The absolute certainty of a sample from one chest being a genuine sample of the whole break, and thus obviating the possibility of the trade having parcels of tea thrown on their hands on account of irregularity. While the disadvantage are these: the slight delay occasioned in keeping teas until the requisite amount of tea to make a break was secured, and accompanying fire risk; chance of tea deteriorating in bulk; the cost of erecting air-tight bins for keeping tea in. The possibility of teas being damaged by water or by any other cause during transit, which in the case of non-bulking in England would not be discovered until the tea was sold, and the utter impossibility in many cases of getting even tares to the boxes. Mr. Buckingham, however, disposes of these, and he says, there is no reason why gardens should not take united action in this matter, and have a registered mark for teas guaranteed “bulked,” the names of all such gardens being registered in London and Calcutta. From the planters’ point of view, therefore, it appears to be in every sense desirable that factory bulking should be adopted.

LONDON TEA REPORTS.

We issue for our planting and mercantile subscribers the usual "blue" circular with reports on tea and sales of Ceylon tea. The market report on "Ceylon's" runs as follows:—

CEYLON.—A second week of heavy auctions proved too much for the market and prices gave way all round to the extent of fully 3d. per lb., medium bionkens being frequently difficult to dispose of except at a still further reduction. Average for week 7-40d., against 8d. same period last year. Ceylon tea sold on Garden Account 1st Jan. to date 1898, 141,060 pkgs., av. 8d. 1897, 126,290 pkgs., av. 8d.

In addition there will be found in another column a letter from Messrs. Gow, Wilson and Stanton, regarding the progress that has been made in the development of the sale of British-grown teas in North America. In 1897 the quantity was 5,698,596 lb. as against 1,489,479 lb. in 1892: in five years the quantity of Ceylon tea imported has quadrupled. It is noteworthy that the sale of Indian tea progresses at about the same rate in North America as that of Ceylon does.

Messrs. Wilson Smithett & Co., in their memorandum for 1897, which we shall give with an early issue, say:—

The cry of over-production has been warningly reiterated for years past, but so long as planters show due regard to the quality of the leaf plucked we see the reason to indulge in pessimistic apprehensions. When we consider that the increase in the Imports of Ceylon tea during 1897, over those of 1896, amounted only to some 2,000,000 lb., whilst the total deliveries showed an expansion of over 7,000,000 lb. we need add nothing to allay any fears on the score of over-production. It has long been felt that if Foreign and Colonial markets could be brought to recognize the economic and dietetic values of Ceylon leaf, a safety-valve against any prospective over-supply would at once be assured; consequently the efforts of all interested in the industry have for some years past been directed towards popularising the article in all Colonial and Continental tea-consuming countries. It is one of the hopeful signs for the future of the Ceylon tea industry, that the effects of producers and distributors alike in exploiting new markets have hitherto been eminently successful. One of the leading features of the market during the past year, perhaps the feature for which we have to be most thankful for, is the important expansion in the re-exports to the Continent. When we point out that more than a quarter of the substantial increase in last year's consumption of Ceylon leaf is due to foreign appreciation and support, and that fully 10 per cent. of the Imports into the U.K. last year were re-exported, and almost entirely to the full benefit of the producer without any intervening profits, owing to the orders received for auction on samples sent out previously, we feel entitled to indulge in hopeful anticipations for the future, and to congratulate planters on a success which has certainly never been vouchsafed in anything like a similar degree to their Indian brethren. As we anticipated years ago the merits of the Ceylon leaf have been most fully recognized and appreciated by the Russian distributors. For many years the work of gaining over this important market proceeded silently, patience and diligence in submitting samples being duly rewarded by the important Russian orders which now almost weekly constitute an important factor in the competition at the London auctions.

THE LETHENTY TEA ESTATES ASSOCIATION, LIMITED.

The first ordinary general meeting of this Association, incorporated on October 9th, 1897, was held on February 3rd at Winchester House, Old Broad Street, E.C.

Mr. W. J. Skene, the chairman of the board, who presided, informed the shareholders that the meeting was but a formal one summoned in compliance

with the provisions of the Companies' Act, 1862, at which no real business was proposed to be transacted, but as it provided him with an opportunity of speaking to the shareholders as a body he must avail himself of that opportunity by giving them a little general information on the subject of their undertaking. In the first place, he stated that the whole of the debenture capital and the whole of the share capital, with the exception of £4,500, which the board thought it desirable to hold in reserve, had been allotted, the whole of the estates had been conveyed to the company, and thereupon mortgaged to the trustees for the debenture holders, and all other formal matters in connection with the amalgamation of the properties and businesses satisfactorily completed. Further, he stated that since the date of the first general allotment applications for shares to the extent of upwards of £3,000 had been made by persons having interests in Ceylon and knowledge of the company's properties, but that the board had not thought it desirable to allot any portion of the reserved shares, as the available working capital of the company appeared to be sufficient. With regard to the business of the Association the Chairman stated that the reports from Ceylon were highly satisfactory, both as to the product of the estates and the prices realised on sales at Colombo, and that a substantial increase in the demand on the part of their home customers had occurred, which they had had considerable difficulty in satisfying, owing to the fact that, pending the completion of the transfer of the properties, they had thought it expedient to realise a larger proportion of their output in the Colombo market at good prices then offering, and their shipments to England had, as a consequence, to some extent fallen off.

The Chairman further stated with regard to the retail or private trade, which up to the date of the formation of the Association had been strictly confined to sales of one fixed quality, all other qualities being disposed of in the Colombo market, that the directors having satisfied themselves that the demand for other qualities was such that they were justified in putting additional qualities on the home market had given directions for the regular shipment from the estates of two other grades of tea for sale at lower prices, wholly distinct from the particular grade of tea hitherto known in England as "Lethenty tea," the grade of which would be strictly maintained as heretofore.

Generally the Chairman stated that the board retained all their original confidence in the prospects of the Association, and that everything that had occurred since the formation of the Company tended to confirm their belief that after the initial difficulty and expense incidental to the conversion of several separate businesses into one joint concern had been allowed for, the Association would be found to have started on a happy and prosperous career.

Mr. Skrine, one of the directors of the Association, then addressed a few words to the meeting in confirmation of what had been stated by the chairman, pointing out the desirability of every shareholder doing his utmost to supplement the efforts of the board by spreading the knowledge of the company's business amongst their friends and all other possible customers with whom they might be brought in contact.

The meeting then closed with a vote of thanks to the chairman, proposed by Mr. R. A. Cameron and seconded by Dr. Bolton.—*H. & C. Mail*, Feb. 11.

TEA IN AMERICA.

EXPERTS' REPORT ON IMPURE TEA.

(From the *American Grocer*, Jan. 26.)

WASHINGTON, Jan. 23.—The full text of the recommendations of Board of Tea Experts is as follows:—
New York, Jan. 21, 1898.

Hon. Lyman J. Gage, Secretary of the Treasury, Washington:—

SIR,—In accordance with your instructions to select standards of teas under the Act of Congress approved March 2, 1897, entitled "A bill to prevent the im-

portation of impure and unwholesome tea," we have the honor to report that we have selected and purchased standards for the season beginning May 1, 1898, and respectfully recommend that all arrivals of tea after that date be governed by these new standards.

We have the pleasure to inform you that the law has been successfully executed up to date, and that in consequence the crop which has arrived since May 1, 1897, is unprecedented in its quality and purity beyond any previous season in the knowledge of the tea trade.

With a view to preserve the protection afforded, our people by this salutary measure, and realizing the supreme importance of uniformity in the examinations at different ports, we respectfully recommend that the number of examiners be reduced to not more than four in all, the Act having, with careful forethought, specified three as the proper number, and that one examiner only shall take charge of both the ports of Tacoma and Portland. We can bear witness that the whole tea trade from the Pacific to the Atlantic coasts, excepting the locality interested, are unanimous regarding this point as the principal menace to the successful administration of the law, and in considering the reasons assigned for extra examiners at these ports as entirely unfounded or misconceived.

In order to promote uniformity in the methods of examination we have considered it necessary to suggest the following regulations as a substitute for those previously issued in Department Circular No. 69, page 8.

COMPARISON WITH STANDARDS.

In comparing with standards' examiners are to test all teas on these points, namely, for cup quality, for any foreign matter on the surface of the infusion, sometimes called scum, and for quality of leaf after infusion. Cup quality shall be ascertained by drawing, according to the custom of the tea trade, with the weight of a half dime to the cup. In country green teas, imperials, hysons, coarse leaf gunpowders and extra young hysons are to be compared with hyson standards, and all other young hysons and small leaf gunpowders with the young hyson standard. The quality must be equal to standard, but the flavour may be that of a different district, as long as it is equal in sweetness. As an illustration, a Teenkai may be equal to a Moyune, but a distinctly smoky or rank Foochow or Wenchow of sour character must not be considered as equal to the two first mentioned.

In order to test for floating coloring matter or scum and also for the quality of infused leaf, a second drawing should be made of double the foregoing weight. Before disturbing the infusion examination should be made for any floating substance, and after pouring off the water the infused leaf should be taken out so as to exhibit the lower side which rested against the cup. Should the mass show a larger quantity of exhausted, decayed or inferior leaf, or foreign substance than the standard, it shall be considered inferior in quality, and the tea must be rejected. In greens and Japans, particularly, the brightness of the leaf should be considered as an evidence of quality.

Should a tea prove, on examination, to be inferior to the standard in any one of the requisites, viz: cup quality, scum, or quality of infused leaf, it shall be rejected, notwithstanding that it be superior to the standard in some of the qualifications. All consideration of the appearance or so-called style of the dry leaf shall be omitted.

It is recommended that Macao or Canton Congous be compared with the standard for South China Congou, and that brick tea be compared with the standard for the district whence it comes. The mustiness or damaged flavour exhibited in certain Canton teas imported for Chinese consumption shall be considered as sufficient cause for rejection.

TESTING FOR DUST.

The dust and fannings in all Formosa, Foochow and Amoy Oologs, Canton teas, Congous, Indias and Ceylons must be restricted to 10 per cent. when sifted through a sieve of No. 16 mesh, made of brass wire. In order that the needle leaf and Pekoe tips may not be confounded with dust, they

must be returned with the dust to the sieve for a second and third sifting until separated.

In the case of Ceylon and India teas the needle leaf and Pekoe tips shall be separated by passing them together with the dust through a No. 26 sieve of brass wire, after the tea has been first sifted through a No. 16 sieve.

Dust and fannings in Japan teas must not exceed 4 per cent when tested by a No. 30 sieve of brass wire. Before condemning any tea for dust, examiners shall sieve at least two packages.

Examiners should preserve in tin for one year samples of all teas examined, for future reference, in case of complaints, and the Board of General Appraisers should also retain a portion of all samples sent them on appeal for the same object. To this end, examiners should always send the Board samples of at least half a pound, and never otherwise than in tin cans securely labeled.

Valuable statistics, showing the quantities of various kinds of teas, admitted and rejected, can readily be furnished by examiners should you see fit to instruct that records be preserved which heretofore have been omitted.

The following are the standards adopted:

- No. 1. Formosa Oolong.
- No. 2. Foochow Oolong.
- No. 3. Amoy Oolong (to be adopted later).
- No. 4. North China Congou.
- No. 5. South China Congou.
- No. 6. Indian Tea.
- No. 7. Ceylon Tea.
- No. 8. Pingsuey Green Tea.
- No. 9. (a) Country Green Tea. Y. Hyson.
- No. 10. (b) Country Green Tea. Hyson.
- No. 11. Japan Tea, pan-dried.
- No. 12. Japan Tea, sun-dried.
- No. 13. Japan Tea, basket-fired.
- No. 14. Japan Tea, dust and fannings.
- No. 15. Scented Orange Pekoe.
- No. 16. Capers.
- No. 17. Canton Oolong.
- No. 18. Scented Canton.

Respectfully yours, (Signed) E. A. Shoyer, of Chicago; A. P. Upham, of Chicago; A. P. Irwin, of Philadelphia; H. G. Woodworth, of Boston; Mansfield Lovell, of San Francisco; Wm. P. Roome, of New York; Thos. A. Phelan, of N. Y., Chairman.

SELANGOR PLANTERS' ASSOCIATION.

The Annual Report for 1897 contains these paragraphs:—In presenting this, their Fifth Annual Report, your Committee have to announce that during the past year eight new members have been enrolled upon the books of the Association, whilst the attached statistics show an increase under cultivation of 1,854 acres and of 1,664 labourers of all nationalities employed on estates. The actual increase of land under coffee should be 2,454 acres as 600 acres of land under tapioca, included in the 1896 statistics, have gone out of cultivation this year.

These returns cannot be regarded as other than satisfactory in view of the fact that whereas in December 1896, the market quotation for No. 1 Liberian coffee was \$31, the price has now fallen.

The importance of the ramie industry was brought to the notice of Government, and assistance was asked to provide for an expert to visit Selangor and report on the suitability of the various districts for the cultivation of this product. The reply of the local Government was unfavourable; but in view of the fact that both the Indian and Dutch Governments have offered considerable pecuniary assistance in connection with the ramie industry, and the cultivation being one which may greatly add to the prosperity of the Federated Malay States, your Committee addressed the United Planters' Asso-

ciation on the subject asking that body to bring the matter to the notice of the Resident-General. We regret to say that the to \$19. That this latter figure shows quite an abnormal condition of things, your Committee feel convinced, and that, with improved curing, a reaction will set in appears merely a matter of time, for the Straits Settlements can always more than hold its own with regard to cost of production, as compared with Rio and Santos, whose huge crops have contributed so largely to the present depressed condition of the coffee market. At the same time, it is evident that coffee planters must turn their attention to the cultivation of other products as well, and your Committee are glad to be able to report that a large number of the valuable Para rubber trees have been planted, and that coco-nuts and ramié, the latter at present on a small scale by way of experiment, have both received their share of attention.

CREEPERS AND DEPRESSION

We are urged once more by a prominent Colombo merchant to raise our voice or rather our pen, in deprecation of the continued flow of young men to Ceylon, in order to learn "tea planting" with the hope of getting a start in life and future employment as planters. Let it be known that the planting country is "chock-full" even now of young men who have little or no prospect of remunerative employment. For one vacancy—a minor Superintendentship—recently advertised, there were sixty applicants we are told; and yet we know that proprietors, agents and inspectors find difficulty in securing the right man, whose whole heart will be in his work, in this time of depression from poor prices and high exchange. A new feature full of warning to young planters and especially new comers, is that absent proprietors must, in many cases, return to work, throwing out their managers, if the depression continues. Again, the process will be—the abandonment in some of the older planting districts of non-paying fields and at the same time, an increase of the acreage in the charge of each reliable man. Every possible means of economising is bound to be adopted; and not the least will be getting rid of young men, "creepers" &c., who have not proved themselves "worth their salt." The time has therefore come, in all seriousness, for discouraging any additions to the list of "the unemployed" in the planting districts of Ceylon.

SORTING TEA.

We believe that the tendency towards careless sorting is becoming universal, and that it should be checked, and perhaps the strongest reason in favour of more careful sorting is that the buyers and brokers complain of too many sorts. Take, for example, a merchant who dealt in coins: he should not object to fudging several rupees in the bags of pice sold to him as copper only. It is strange that sorting machinery, instead of becoming more elaborate and delicate, has become more "simple," and the latest developments put temptations in the way of the Manager. A screw is provided at the lower end of the cylinder by which it can be depressed, i.e., a ready road is opened to hurry over the work when there is a press, and the tea can be rushed through. It is well worth thinking of. How much fine tea can you afford to present gratis to the buyers of your coarse tea, in order to save time and trouble? Is it just possible that you give away the price of an extra sorting machine by hurrying through one month's tea? Suppose that

you make 72,000 lb. of tea in one month (=900 maunds=30 maunds daily) and that by hurried sorting you lose 3 per cent of orange pekoe, and this orange pekoe loses 6 annas per pound by getting into the low grade teas. The sum works out 72,000 lb. \times 3 per cent.=2,160 \times 6 annas=12,960 annas=810 rupees, which is the price of an extra sorting machine. We have purposely overstated the case, but do think that many estates throw away the price of a sorting machine during the course of one whole season, and that some few actually sacrifice R1 per maund of tea by careless sorting. (The figures above show a loss of R800 on 900 maunds of tea). The buyers like careless sorting because it saves them trouble and gives them better value for their money; the brokers like it because it saves trouble; the Managers like it because it saves trouble; and the inventors of machinery supply what is wanted. We can remember the birth of sorting machinery, and some of the earliest machines had oscillating frames, into which a hand sieve could be placed and removed when sufficient tea had fallen through. Later on we took to cylinders five feet in diameter with battens inside, and the tea received the treatment which turns cream into butter.

Now we find the cylinder to be about 3 feet in diameter, the different "meshes" are 3 feet long, so that the tea has hardly time to get fully sorted; then on a heavy day you can depress the cylinder and get the work done quicker. The machine referred to is admirably adapted for its purpose (which is not good sorting, but to suit the ideas of the Managers, brokers and buyers). With sufficient inducement the maker of the machine could turn out one which would give two Orange Pekoes, two Pekoes, Pekoe Souchong, Broken Tea and Dust. But the price of the machine would be greater. Or two of the above machines would sort well if not made to "do" a large quantity. Of course, the great inducement to hurried sorting is have big "breaks," but a reference to the tea sales will show that small breaks of good tea sell well. Referring to the last tea sales, we find a Doocars garden sold 4 chests Broken Orange Pekoe at 10 annas and 23 chests Pekoe Fannings at 5 annas 8 pie. The Broken Orange Pekoe was 400 lb. the difference in price 4 annas 4 pie, and if that Broken Orange Pekoe had been put in or left in the Fannings, the loss would have been over R100, because 400 lb. of good tea would not have raised the price of the 2,300 lb. of Pekoe Fannings. There is danger in oversorting, because the tea can be made very grey if kept too long on the sieves, but the idea is not to get more Orange Pekoe by longer sifting; it is that the fine teas should be extracted *before cutting* and kept separate from the fine teas extracted *after cutting* up the bulk. We are writing from experience, and so can recommend others to try more careful sorting. On some estates the first operation is cutting up the tea in a Reid's breaker, which forces all the tea through a No. 4 sieve. This mixes up all the grades; pieces of Pekoe Souchong leaf will get into the Orange Pekoe. On these estates it would be well to try how much Orange Pekoe and Pekoe can be got without any breaking, and these two teas should be kept separate. Having got out the "fine" tea, the residue could be broken in the Reid's breaker and made into Pekoe, Pekoe Souchong and Broken Tea. This double sorting would necessitate more machinery, but the difference in prices obtained would pay for that and leave a profit. We believe so much in good sorting, that we think it would pay to buy tea in the market and resort to it—extracting the higher grades from the lower and selling them separately. A company formed for this purpose would also be able to score by making big breaks for America. Supposing that they bought 500 maunds of Pekoe and 500 of Pekoe Souchong; by re-sorting, they extract 5 per cent Orange Pekoe out of the Pekoe and 5 per cent Pekoe out of the Pekoe Souchong, they would have 25 of Orange Pekoe, 500 of Pekoe and 475 of Pekoe Souchong.—*Indian Planter's Gazette*, Feb. 19.

PLANTING NOTES.

THE MANGO: THE "PRINCE OF INDIAN FRUIT," AND A "DISEASE-CAUSING FRUIT."—That most cultured of Anglo-Indian statesmen, Sir M. E. Grant-Duff, has been giving a lecture before the Society of Arts on the "Recreations of an Indian Official" and very interesting he made it; but we only refer to it today to quote the ex-Governor's high praise of the mango in the following sentence:—

There were the *Anacardiaceæ*, to which belongs the omnipresent mango as to which we may say, with more truth, what Bishop Berkeley is reported to have said about the strawberry, that he had no doubt that the Almighty could have made a better fruit, but that he had certainly not done so.

This we put in contrast with information given by Sir George Birdwood in a communication to the same journal as supplementary to the Lecture in which he gives the native meaning of the names of fruit, trees, &c., and among the rest:—

Amba.—(*Magnifera indica*) "disease causing"; the Mango, so called by Anglo-Indians because first known to them by its Tamil name, *manka*, meaning "man-fruit." The fruit is apt to act injuriously on the kidneys, and cows fed with its leaves for the production of the exquisite mango yellow dye of India, obtained from their urine, die in a few months. This is quite new to us—and, we fancy, to most of our readers—that the mango is apt to act injuriously on the kidneys (we suppose only when eaten in excess as is the case with the Bengal natives who live on mangoes at one season of the year) or that the leaves were so fatally injurious to cattle?

THE CLUSTER PINE is being introduced into West Australia by the Conservator of Forests, Mr. J. Edine Brown, who has obtained a large consignment of the seed for planting on the interior sand wastes as well as along the sea coast. Some interesting particulars are given as to the success which has attended the introduction of this timber to the Cape, where the Cluster pine at Genadendal has a clean, straight, robust growth that is unsurpassed by the best trees in the Cape Peninsula. Trees as straight as a mast and 70 feet to the first branch are not uncommon. Cluster pine timber is used for all the purposes where imported pine is employed in Cape-town, except for fine carpentry. Cluster pine answers well for floors, joists and beams; but for fine carpentry, such as windows, its hard, resinous nature makes it difficult to work. At Genadendal the Cluster pine timber is brought to the side of the road and there sold to the farmers, who come with their waggons and fetch it away. Prices are low. A sound straight log 9 inches diameter and 22 feet long would be sold for 3s. Scaffold poles 4 inches mean diameter and 36 feet long sell for 9d. The extended planting of Cluster pine in the southern and south-western districts has long been advocated by the Cape Forest department. All along the better watered south-western coast districts it exists as a hardy forest tree, requiring for its propagation only that the ground be ploughed or otherwise broken up and sown at the proper season, i. e., with the first winter rains. No plantations in south Africa, and few in other parts of the world, can be laid down so cheaply and so easily. It is as simple as sowing a field of wheat or oats. A good bushel of seed, or about 40 lb. to the acre, is required. The seed costs from 3d. to 4d. a lb., i. e., it can be obtained at this price from the Cape Government.—Melbourne *Leader*, Feb. 5.

A TEA PACKER is being sent out to the Poogbon Tea Estate. (As bulking at the factory is coming into vogue again, says a Darjeeling paper, these machines must come into more general use as it is almost impossible to get two chests of tea packed exactly alike by the old methods of pressing in by the hand or feet, one chest is bound to contain more broken tea and dust than another. At the same time it is doubtful whether more tea is got into a chest by the machine than by foot (as some assert); so we are informed by some experts who have dealt with and seen many.

LADY-BIRDS FOR MADRAS PLANTERS.—The Government of Madras has promised to contribute £2,000 towards the expenses of sending Mr. H. O. Newport to Australia to collect and bring back ladybirds to exterminate the green bug and other scale pests which are doing so much damage to the coffee plantations in Southern India, on the Lower Pulneys especially. The Government's contribution is a moiety of the calculated expense of sending Mr. Newport to Australia, placed at a maximum limit of £4,000. The planters themselves have subscribed £5,100 for this particular purpose.

KAOLIN AND FIRECLAYS of high quality are reported to have been found in considerable quantities in several parts of New Mexico. The most important is situated near Socorro. The most important is situated near Socorro, and is now being worked. A new discovery of a large deposit of fireclay and kaolin near Santa Fe is also notified. A correspondent in sending the above asks "What about Ceylon Kaolin?"—In reply we can only say that we have some of the finest of kaolin, prized in ancient times by the Chinese for their fine ware. But although Sir Wm. Gregory tested it satisfactorily in getting imitation Sevres ware made from it; yet it was not considered that it would warrant the cost of digging, packing and freight to export it.

"HOPE FOR THE WEST INDIES."—In one of the Magazines Sir George Baden-Powell, a reliable colonial observer, finds the abolition of bounties insufficient for the preservation of the sugar and other industries, and pleads for an Imperial department for information respecting West Indian products, in connection with Kew:—

"The culminating advantage would consist in appointing a travelling Inspector of Tropical Products, who should, with a small staff proceed on regular tour, at the right seasons, to our tropical colonies to gather and to disseminate information of a thoroughly reliable and independent character."

In fact—as a correspondent observes—what is wanted is a peripatetic "F.A." ("Tropical Agriculturist"!)—Our Monthly T. A. is secured and filed in most of the West Indian islands.

FISH MANURE AND WEEVILS.—Recently a market gardener in Kent applied a heavy dressing of fish manure—the putrid carcasses of sprats and starfish—on to a piece of poor land with the idea of enriching it. Soon after the ground appeared to be alive with small brown weevils, very similar to the Vine and Raspberry weevils, which played dreadful havoc with the vegetables which formed the crop. Now the gardener is at a loss to know how to destroy the hard-backed marauders, and questions the advisability of using putrid fish as a manure if it is the means of introducing pests of this kind. In many Raspberry and Strawberry growing districts fish manure is largely used, and the Raspberry weevil is the common enemy, and a hard one to fight. Is this pest introduced in the manure? because if such is the case it would pay Raspberry growers to let it severely alone. Perhaps other readers can throw some light on this matter.—KENTISH MAN.

JAVA TEA IN 1897.

The annual report on the trade in colonial products for 1897, issued as a supplement to the *Indische Mercuur* of Jan 29, contains the following information regarding Java tea, supplied by the firm of Wed. J. vander Chijis and Zoon of Delft:—

During the past year there were offered at eight sales in Amsterdam 4,871,564 half kg. of tea at an average price of 32½ cents per ½ kg. (about 1 1-10 lb. avoirdupois) (according to the official statistics of the tea warehouse superintendents). In order the better to demonstrate the growth of Amsterdam as a colonial tea market, we append the totals of the imports, home consumption and exports since 1891. These amounted to:

	Import. ½ kg.	Home consump. ½ kg.	Export. ¼ kg.
1891 ..	1,433,000	1,270,000	413,000
1892 ..	3,043,000	1,519,000	1,222,000
1893 ..	3,083,000	1,685,000	1,355,000
1894 ..	4,441,000	2,133,000	2,120,000
1895 ..	3,752,000	2,110,000	1,880,000
1896 ..	4,456,000	2,275,000	2,275,000
1897 ..	4,871,000	2,488,000	2,235,000

from which it appears, that the imports during 1897 were more than three times greater than only six years previously; the Netherlands consumption almost doubled in that short period, whilst the export was more than five times as great! The use of tea in this country is steadily on the increase, and shows an advance of about 9 per cent in the past year.

As regards the prices as these eight sales: The first sale began well, and prices even exceeded the brokers' rather high valuations; the second sale went off at somewhat similar figures, ordinary being even some cents higher. The *circa* 9,000 chests sold on April 22 went off dully, partly owing to the rather large quantity of ordinary, and also on account of the little variety. Prices however were not in that case lower than might reasonably have been expected. The auction of June 2 again brought us a large quantity of ordinary, for which there was little demand. This therefore again went off lower, whilst fine and finest teas showed a rising tendency. The demand for fine and best sorts was even more manifestly displayed at the sale of July 21, when a firm rise also took place. Notwithstanding the relatively large quantity (over 10,000 kgs.) all went off well, and ordinary was even some cents harder. On Sept. 9 again, over 12,000 chests were sold by auction, for which 400 different samples had to be tested. This quantity was however no hindrance to firm and generally higher prices. The choice also was a very good one, as buyers of the most ordinary could find what they wanted just as much as those who gave two guilders for the handsomest golden tips ever prepared by Assam or Ceylon planter. In our report on the sale of Oct. 20 we find that the prices were again on an average 3 or 4 cents higher, whilst we mention the plantations that, notwithstanding the distinctly evident advantages of our market, still continue to send their teas for sale to London. With pleasure we learn now, that the often crooked dealings and machinations on the English side, in order to retain in London that little portion of Java tea that still remains to them, have failed. With great satisfaction we see that two plantations that were formerly sold in London have now turned to the Netherlands trade. On Feb. 2 will appear

invoices of the Wana-Sari and Hardja-Sari plantations, as well as that of an entirely new mark, the Tjidj-rock estate. These teas will undoubtedly, when once they have been better introduced into our market and our consumption, be more considerably treated than in London, where they, in common with all Java tea, are with true English arrogance characterized as surrogates of the British Colonial hobby-horse and the product of Ceylon—which island these friends were moreover so good as to filch from us once on a time.

The last of the series of sales of the year was held on December 8. We give once more what the *Telegraaf* reported regarding this: "The firm result of the last of the eight sales held on the 8th inst. was a worthy conclusion and a new proof of the strength of our Java tea market," with which we fully agree.

We advise planters—we have already repeatedly brought this forward, and only Pan-gerango has complied, thus setting a good example—to keep before their eyes the fact that Java tea is a product grown by Netherlanders, consigned by Netherland boats to a Netherland market, whilst in addition this product is to a great extent used by Netherlanders, or exported. We therefore gladly set forth with emphasis the following on the programme of 1898:

"New preparation" (or planting) for the super-session of "Assam tea" or "Assam grown."

The word "Java" to be marked in large letters on the chests.

"*Ge broken Pecco, Thee and oranje Pecco*" in place of the foreign denominations now used, just as *Wit-punt* or *zilverpant Pecco* for so-called Flowery Pecco (with white tip) and for distinction from *Goudpant Pecco* for the so-called Flowery Pecco (with gold tip).

RUSSIAN TEA AGENCIES IN CEYLON.

Mr. J. Findlay, special agent of Messrs. Mochanoff, Pechatnoff & Co., Merchants and Commission Agents, Hankow, Kiskiang, Foochow and Tientsin, who arrived here sometime ago and left for Hankow by the ss. "Chusan" has established an agency of his firm here which is being temporarily taken charge of by Mr. Frank Blakwill who will be succeeded in about two weeks' time by a Russian gentleman. We trust that the firm will have a prosperous time. We understand that in the course of the year, two or three Russian houses will open branches here and this, we think, looks well for the Colombo market, although we fear the Russians will not have so large a selection as they would wish. That however is a matter which rests with the planters and London shareholders. At the present moment, the Colombo prices are said to be distinctly better than those ruling in London. We understand the Russians, however, prefer to buy their teas direct from Ceylon. About 70,000 chests of Ceylon tea were used in Russia last year, and we hope that, with the advent of Russian houses here, this quantity will be very largely augmented. It is very satisfactory to learn that Ceylon tea is found very suitable to blend with China, for Russian purposes—far more so than Indian tea—and everything points to our getting an increasing hold of the Russian tea market. There is scope for a manifold increased consumption of tea among the Russian people if only the heavy Customs duty was reduced.

A CEYLON PLANTER ON THE HUNT FOR TEA SEED.

Mr. R. C. Wright, formerly of Deaculla estate, Haputle, who left Ceylon last September, has been on a most extraordinary journey, which tried even his well known powers of endurance—says a contemporary—through the Shan States in search of the wonderful wild tea of Thebwa. His object was to get the seed, and this took him seven hundred miles on foot through a wild uncivilised country. For three weeks he was tramping over native tracks and through jungle, sometimes up to his waist in an icy cold stream, and sometimes grinding up hill under a blazing hot sun. He was quite alone during the whole journey as far as European company is concerned, but, through good luck in getting a passport from the H-ipay Sawbwa, he was generally treated with courtesy by the natives. He started along a road with a bullock waggon of provisions, &c., and attendants; then he went along accompanied only by an interpreter and a man who did the cooking; and when these ran away,—as they did, probably because they found the life too rough,—Mr. Wright was left to simply depend upon himself and his gun, shooting and cooking his own food and sleeping in the villages as best he could. He admits that the whole object of the journey was a failure, as though he saw a lot of splendid tea of the famous Manipuri jät, he could get no seed. It was, however, a great success from a sporting and exploring point of view. We understand he had some pretty large commissions in regard to the tea seed, and the sole reason why he could not get it was because he was there at the wrong time of the year, when the plants—some of them 20 feet high—were flowering.

After leaving Ceylon Mr. Wright went to the Straits and Java to have a look round. He proceeded to Batavia, and from there by steamer to Samarang and on to Soerabaya. Thence he went through the coffee district to see the coffee. He says he thought it very fine coffee. It suffers, he says, from all the diseases we have in Ceylon, but it is such a splendid soil that they do not seem to have the same effect, and the planters are able to struggle against them. Then Mr. Wright worked his way back overland by rail and whatever conveyances he could get, to Batavia, and from there he returned to Singapore, and went for a tour through the Malay States to see the country.

Then Mr. Wright went up to Burmah, with the object of going up into the Shan States and securing the wild tea seed he was after, which grows principally on the banks of the Upper Chindwin river and in the more Northern of the Shan States. He saw the tea at Pangnin. It was good Manipuri jät, dark leaf, the trees being about 12 feet high. They kept them down to about that height by chopping the tops off. There were some trees about 20 feet high. He was told, however, that he could get no seed because it was the wrong time of the year. He had been misinformed and had arrived in the flowering season. It was round Nansam that the finest tea was grown. It was 5,000 feet above the sea and very large quantities of tea were grown there. Whole hill sides were cultivated. Some of the bushes were good, but as a rule they were cut, and hacked about and spoiled for tea bearing purposes. It was all one jät, Manipuri, which is the wild tea of Burmah. From what he could see, if it were properly cultivated, it would be very good tea, and of very fine quality.

TRADE IN COFFEE.

Although by the publication of the stocks last Saturday the world's visible supply of coffee was shown to have decreased during December by 4,870 tons, owing mainly to a falling off in the Brazilian receipts, there does not appear to have been any corresponding decrease in the quantity put on the London market, heavy receipts and a corresponding decline in value being the chief features of the trade since the turn of the year. Moreover the assortment of qualities is of the most varied description, and probably the difference between extremes is at the present moment wider than ever. Unfortunately the demand is in no way commensurate with the supply, and this is a condition of things which shows no improvement as time progresses. It is many years, however, since such keen depression has been experienced as during the past twelve months. Ordinary qualities receded from 63s. to 40s., owing to the enormous receipts at Brazil ports, which presage a crop of over 9,500,000 bags. In the early part of last year low middling to middling realised 82s. to 95s., but these declined to 61s. and 76s., and East India showed a proportionate reduction. Brazilian sorts have been naturally most affected, and suffered a depreciation of nearly 50 per cent., good average Santos at the end of November falling as low as 26s., while good to fine colour descriptions, which have been comparatively scarce, were least affected, and the margin between the values of fine and common is now exceedingly wide, ranging from 30s. to 105s. Since the practical extinction of the coffee crop and its extensive cultivation in Ceylon about a quarter of a century ago, the world's supplies to London have never regained their normal character in consisting largely of good, useful home-trade qualities of plantation growths at moderate prices; and pending the opening up of fresh sources of supply in Central America and other tropical parts—which by the utmost limit of production have at no time been able to make up for the virtual loss of the Ceylon description—the wholesale dealers in coffee have been put to all manner of shifts and inconveniences to prepare for consumers in the United Kingdom a sufficient quantity of this excellent beverage, without, however, succeeding in gaining for it increasing popularity. In vain have other coffee-growing countries tried to fill the place of Ceylon, for while Costa Rica, Guatemala, and other tracts of the Argentine territory have produced beautiful specimens of colour sorts—familiarly known as "fancy" kinds among both dealers and exporters—the total weight of their respective crops at the outside has been only light; and although Brazil produces far more than the rest of the universe put together, the style, quality, and taste of her coffee is certainly not that suited to the requirements of the users in this country. The extension of cultivation in British East Africa, however, promises to provide a better supply of colour coffee, shipments showing considerable expansion, while a moderate parcel has been placed on the London market from Fiji showing ordinary mixed quality. Buyers have in consequence acted very cautiously. The Costa Rica and Guatemala crops have been both fine in quality and abundant, but the forthcoming crops will be probably 20 per cent. to 25 per cent. less on account of drought. Columbian has been in better supply, and shows a great improvement in quality. One effect of the lower prices is to stimulate consumption, the European and American deliveries last year exceeding those of 1896 by some 75,000 tons, or fully 10 per cent. In spite of this, however, European stocks have increased over 90 per cent., and the world's visible supply on December 1 amounted to 374,870 tons, against 233,020 tons a year previous.—*Grocers' Journal*, Jan. 22.

VANILLA IN ZANZIBAR.

FRUITING VINES IN THE MWERA VALLEY.

Although there are many small patches of Vanilla growing on the island we never know till quite recently that Vanilla had ever flowered and fruited here. Vanilla is very popular here as

curiosity and an ornamental plant. Isolated vines can be seen in many shambas, both in Zanzibar and Pemba, trailing up coconut and mango trees. To Jack Savey of Dumbwi, Northwera Valley, belongs the credit of first having demonstrated that Vanilla not only grows in Zanzibar but flowers and bears fruit in due season. Jack Savey or Abdullah Brahim, as he is more correctly known among the natives, is an old ship's Krooman. He was attached to H.S. "Thetis," and was paid off when the "London" was first commissioned. He therefore carries us back to what to most of us is prehistoric times. In early life he spent fifteen years in Seychelles and learnt, among other things, to fertilize the flowers of Vanilla and to prepare the fruit. So when in his old age he settled down to enjoy the repose of country life in Zanzibar he planted some vines in his shamba. Today the vines tower above him in huge tangled clusters, threatening to overwhelm his house.

Jack neither trained nor tended his charges but quietly bided his time till the flowers should come, when he deftly put in the fertilizing point. How many crops of fruit he has had is not clear, though it is more than one. Some of the pods we saw at the beginning of December were 7 inches long and had four or five months' growth before them. There is every promise therefore of good quality beans as far as size goes.

We have before pointed out that not until a plant has produced fruit can it be said that it has found a congenial home. There is always the after question whether the quality and quantity of fruit is sufficient for market purposes. The fruiting Vanilla in the wera Valley has, as if by an accident, cleared up one hitherto doubtful point about this product. Plantations may be put down with the reasonable certainty that they will in due course come to flower and fruit. If the industry were seriously taken up here we see no reason why Zanzibar should not in time become a large exporting country, and run in harness with Reunion and Seychelles.—*The Shamba.*

PLANTING NOTES FROM BADULLA : TEA AND FOOD STUFFS.

March 5.

One cannot help but think that the low price of our staple "Tea" must be pressing some planters a good deal; economy in field and factory must be the order of the day, to make ends meet. What a tale our different tea companies are telling this year compared with previous years in the way of dividends!! and I am very much mistaken if we have seen the worst yet. With exchange so high, and still going higher. And dear rice still continues although it is difficult to see why this last should be; the many Chetty rice dealers in Ceylon must have been making their pile ever since the slip on the railway at Allagalla. Prices went up then, not only for rice, but everything else in the way of food stuffs which our coolies and even ourselves require for our daily sustenance, and when they are likely to fall again is a problem difficult of solution. There is no reason whatever why a great proportion of the food stuffs which are daily consumed should not be grown by the labourers themselves, as a rule. In fact it is the exception to find coolies on an estate without sufficient space to grow vegetables, etc., but they seem to go about it in a half-hearted way, and evidently prefer paying the grasping kaddy-keeper his excessive prices.—*Cor.*

CHANGED TIMES IN TEA : HOW TO MEET THE NEW CONDITIONS.

In the happy days when the rupee was allowed to follow its bullion value; when there were no currency tinkers to interfere with the present or endanger the future; when the Indian mints were

open, and Eastern trade was flourishing and prosperous,—the planters were every now and again reminded, as the London average for their teas grew less, that they were "living on Exchange." "What would we do, if it were to go against us?" was the question the long-sighted ones put to themselves and others; but as there was no pressing call for an immediate answer, and as "short views of life"—Sydney Smith's philosophy of happiness—brings most content, the question remained unanswered, and it was a good time the planters had. Now the inevitable is upon us, and currency tinkering has given to the world the astonishing spectacle, of an Empire, with a dishonest coinage and statesmen who uphold it—this *today*, and in the face of all that history has taught!—and instead of "living on exchange," as had been so comfortably done in the past, the planters are now called on to face and answer the question "What is to be done now that Exchange rules against us?" The steadily-increasing stream of rupees, which a falling Exchange provided in such an easy way for the producer, is dried up, and instead of now living on Exchange there is the prospect ahead, of either going back to the primal condition of earning bread by the sweat of the face, or like the Polar bear, in *its* winter, to living on one's own fat! The former of the two alternatives is the better one, and it is evident that, among the planters, there is a buckling to, and a determination to make the most of things, in the hints which have appeared in the public prints as to the crying necessity of careful and cheap working, and a general alertness in regard to all estate matters. As the margin of profit grows less and less, the room for "playing the fool" without being found out, is circumscribed; and to show well after a year's working, now that things are cut fine, will demand the prominence of qualities which were only secondary when the majority were able to live well on Exchange.

Prominence has been given to the cost of plucking and calculations have been made to show how Tea Companies and private proprietors would benefit, if, instead of day wages, there were payment by results. To reduce the cost of plucking from 8 cents to 6½ cents, is, it is said, quite within the reach of planters if there be combination among themselves, and contract plucking be insisted on. Those who advocate the new order, have tempting figures to offer as an inducement to follow it. Those who are against it, have a dread of coarse leaf, a lowering of the qualities of teas, and a further run down of prices. Quality, quality, quality, is what they emphasize, and to pluck fine is but another name for high cost. Cash pluckings on estates, whether it be on Saturday or Sunday, are we are told, always a bother; for although the quantity harvested may be excessive and the average per cooly something handsome, it has often to be gone over again to gather out the hard and coarse, and the trees frequently suffer from indiscriminate stripping. Cost of plucking must always be subject to the kind of tea aimed at; for, a fine tea is more expensive to gather than a medium quality. Still, whatever kind may be desired, to be able to produce it at the lowest cost is what should be the aim of all; for now that we are not living on exchange, and we have before us the prospect in the near future, of a considerable

Increase of our total out-turn, to work cheaply will be an essential to profitable working, and in some cases to existence. If contract plucking is to be the salvation of some estates, and the gilt edging of others, there can, of course, be no reason why it should not be carried out. But, as things are at present, where, below a certain average, a full name is not given we have contract-plucking now in force, and the question is simply this, has the average demanded not been placed too low? What coolies can do when working for cash,—or as is often done, a name for a certain quantity, and money for the surplus,—should open the eyes of most men, and the piece work, with its resulting higher wage is an appeal which Ramasami will not be able to withstand. It may take a little time before our estate labour force will pluck exactly as desired, and to the planter there would be at first a great deal of worry, and a call for alert attention: but that this could be overcome and that ere very long and without much friction either, we certainly believe. It would be folly of course to look for all the advantages of contract plucking to be secured just at once, but even a cent a lb. saved is something, and then to go on to further conquests. To judge by a cash scramble of the quality of leaf which regular contract plucking would result in, is about as fair as to compare the scurry of a belated weeding contractor in dread of a fine, and the work thus produced, with the carefulness manifested when the contract is well in hand. But on the whole, our conclusion after full consideration and reading and listening to the opinions of many planters, is that "contract plucking" is for the low country where quantity, rather than quality, is the *desideratum*.

The call for economical working is only muttering as yet; but it seems likely to increase in volume and imperativeness. At every point of an estate's outlay there will require to be careful thought and keen economy. It is the cents which will have to be taken care of, and all over the manifold daily workings of tea properties, there must brood the watchful eye, and a nervous determination to see that each individual labourer does his day's work, and that carefully and well. With dwindling dividends, there is sure to come the cry of change of management (and perhaps of Directorate!); for, without dividends, Companies have no call to be. As an army is said to march on its stomach, so the sweet reasonableness of public Companies only lasts as long as dividend warrants are regularly received. When the Manager and Directors fail, repeatedly, to produce these, there must be a rough time in store. Ceylon planters have for some time back had easy times. When an estate was good, and there was exchange to live on, slack management and nominal oversight were not noticed much; but now that a dishonest rupee has to be wrestled with, as well as low prices and an increasing output, the conditions are wholly changed; and only to those who recognise this fact, and set themselves manfully meet it, will there be a due reward.

PERADENIYA GARDENS AND CAMBRIDGE.

On 25th January Mr. Pearson, B.A., of Christ's College, Cambridge, who was recently in Ceylon for the purpose of Botanical Research, read a paper before the Botanical Club on the Peradeniya

Gardens which was illustrated by fine photographs. Professor Marshall Ward was present and took a part in the discussion that followed; the question was gravely propounded "why do more coconuts fall in the night than in the day," and it was suggested that the explanation was to be found in the fact that the stem and stalk were fuller of sap, because the leaves retained their moisture during the night, while they give it off freely during the day. Mr. Pearson would like to know whether it is an acknowledged fact in Ceylon and elsewhere, that nuts *do* fall more in the night than during the day. Perhaps coconut planters will be able to speak with authority. Mr. Pearson has not yet received the botanical specimens in methylated spirits that he had collected, which shippers have fought shy of; but hears they are now on their way home, so nothing can be heard at present of his researches in reference to the patana grasses of Ceylon.

THE EFFECTS OF FIRE ON GRAZING AND THE PRODUCTION OF GRASS.

Forest officers in their endeavour to extend fire conservancy, constantly find the objection put forward that fire protection will interfere with grazing. There is among agricultural people a firmly rooted conviction, which is not confined to natives of this country, that burning off the dead grass that remains at the close of the autumn or in early spring, is a necessary condition for a good crop of grass. It is said that burning not only causes the grass to spring earlier and yield a more luxuriant crop, but, also destroys a vast number of ticks and other insects, which if unchecked, would render grazing an impossibility.

On the other hand, it is asserted by Forest officers that the annual fires, though they may stimulate the grass to earlier growth, have the effect of killing out the better kinds and leaving only the coarser varieties which cannot be eaten by cattle except when they are quite young. That this is the case and that constant burning must necessarily cause deterioration of the soil, seems almost self evident, but in the absence of recorded facts it is often difficult to convince people who hold opposite views. It is hoped therefore that those who are in a position to do so will take the matter up and give the readers of the "Indian Forester" an account of the precise effect on the grazing or grass supply, of any protective measures with which they have been concerned. I have heard it stated that in many cases where fire protection has been for many years the rule, the grass supply has been so obviously improved that neighbouring landholders have come to recognize the value of such measures and have taken to fire-protecting their own forest lands, but I cannot find any reports in which such facts are officially recorded.

Another point in which information is desirable, is whether fire protection alone is sufficient to improve the crop in areas set apart for the production of grass, and if so how many years it takes to obtain the desired results. So far, my own experience has been that where rank grasses have once thoroughly established themselves, protection alone, unaccompanied by heavy cutting or grazing, only causes such grasses to grow more luxuriantly and that the finer kinds do not re-assert themselves. This, of course, applies only to bona-fide grass lands: in areas under forest, the young trees which naturally come up as a rule kill out the tall grasses, but I heard it stated that this is not the case in chir forests, in which fire protection is said to stimulate the production of coarser and ranker grasses.—"X" in *Indian Forester* for February 1898.

THE DEVELOPMENT OF THE COCONUT INDUSTRY.

When reading the paragraph on Coconuts, in the Notes on Economic Products in Mr. Willis's Administration Report for last year, it struck us that the language used might be misunderstood, if indeed it was not itself due to a misapprehension of the figures quoted. Our legal contemporary has been the first to trip in considering the export statistics on which the Director of the Botanic Gardens commented. Our fear was that the official comments,—as indeed those in the case of Cacao as well,—might lead to the impression that the exports show an uninterrupted advance. Of Cacao, for instance, Mr. Willis writes:—"The Exports continue to increase steadily, being 34,503 as against 31,366 cwt. in 1896." The increase last year as compared with the previous year is beyond question; but a steady increase can scarcely be predicated of the product which in 1893 showed much larger exports than in the two following years, and which has shown the fluctuating tendency which characterised Coffee after it had passed its meridian, when a heavy outturn was generally followed by a short crop. The remarks on Coconuts again may possibly suggest to the unwary the progressive increase of exports—the comparison of 1897 with 1896 being held to reflect the general increase from year to year. Careful examination of the figures for any decennial period will show fluctuations in every product of the Coconut palm, save the Desiccated Kernel in which there has been a steady annual increase since the industry was started, if we exclude the single year 1894, when there was a slight decrease as compared with 1893. That was due, as we explained at the time, to the Mills having worked short time for a few months, either owing to orders from home having slackened temporarily, or with a view to discourage would-be producers who were contemplating erecting small Desiccating Mills throughout the country. There may be—there probably has been for years—a steady increase in the Coconut crops of the Island, the produce of the area coming into bearing being more than sufficient to make good any shortage through bad seasons in particular districts; but all the same, our Export tables—and it is on these Mr. Willis bases his remarks—do not show that progressive increase which we all desire, and which our contemporary of the local "Examiner" has assumed. In referring to the decrease in the export of Nuts in 1897 as compared with 1896, he rightly says it is insignificant, and is more than compensated for by the increase in the quantity of Oil and Desiccated Kernel; but we cannot accept this increase as a reason for the decrease. That would imply that we sent away all that we could spare. We should think the island would have been able to ship double the number of Nuts it did, if only there was a demand. The quantity of Nuts shipped is regulated by orders from Europe (chiefly) and by the cheap freight which may be available, rather than by the outturn of our Coconut-groves. As we pointed out in our article on the Export Statistics of last year, in our issue of 11th January, the Coconut Oil exported in 1897 represented only a fair average quantity, for while it exceeded the exports of the two previous years, it fell short of the quantity for 1894, and was far short of that for 1892, when 550,977 cwt.

were exported. That quantity represented a total of 275,488,500 nuts; and adding to that, the numbers represented by Desiccated and husked Nuts, we have close on 300,000,000 Nuts for 1892; whereas our Exports last year represent about 40 to 50 million Nuts less. There has not been any falling-off in production; nor were the exports restricted by increased local consumption. The demand for Oil has been slack, and that doubtless stimulated local consumption. Without a better demand for Oil, in the future, the supply of Nuts is likely to outstrip the demand. Then, the local "Examiner" is mistaken as regards Coir. The Exports last year were far in excess of those for 1896, and Mr. Willis has had no monopoly in the statistics for 1897. They have been available to the public from the first week in January, and have been freely discussed and commented on ever since.

PLANTING NOTES FROM KALUTARA.

Neboda, March 8.

We seem to be fairly over the "droughty" season which has let us down lightly in comparison with previous years; for I have known in bygone hot seasons quite a month's dry weather at this time of year; whereas this season we have scarcely had 12 days dry. But then our N.-E. monsoon (October-November) was a total failure and fortunately few believe in this monsoon for planting.

The newest (though not so new in this part of the world) of new products is *Hevea Braziliensis* (Para rubber) which promises well from all accounts and fortunate are the lucky ones who have seed to sell.

There are not *nearly* the quantity of seeds growing which are reported; owing to damage done by porcupines, hares, cattle (especially) and weeders and I doubt if a quarter of the seed sold from various gardens ever grows owing to these causes. It seems regrettable to me that the Government should have taken up the rôle of "seedsmen and florist" in connection with the sale of Para rubber seeds. I could quite understand it if the revenue of the Premier Crown colony was in danger of extermination from the collapse of our *staple product*. However, I hope, that Mr. Willis's Department will get the full benefit of the sales and that in future Reports (if this is to be the Government policy) we shall hear no more of cattle running wild in the Botanic Gardens and damaging valuable plants and all for the want of a few yards of wire fencing!

THE HOT SEASON IN CEYLON AND SUMMER IN AUSTRALIA RABBIT AND INSECT PLAGUES.

(Communicated.)

THE beginning of the hot and trying season (from middle of February till towards the end of May) has again come round, and no doubt many of us who from business pressure or official duties are unable to leave the low-country (from altitude 2,500 ft. to sea level) for "the hills,"—4,000 feet and upwards—will be forced to give a thought to the unfairness or inequality of our climate and to the advantages of living in countries not styled the tro-

pics, where we are apt to think a cool and invigorating atmosphere can always be shared equally by all. Though Ceylon is as tropical geographically as it pretty well can be, yet we doubt very much whether if given the choice we should not prefer its climate generally to that which the Australian colonies have been experiencing during the last two or three months according to recent news received from there. Here in Ceylon, at our hottest stations the maximum shade temperature seldom if ever exceeds 95° Fah.; there it seems to reach as high as 125° or more, 110° being evidently looked upon as only an ordinary day temperature in summer.* Our annual rainfall (not counting the Northern Provinces) is anything between 50 and 200 inches: whilst at Adelaide the total rainfall recorded for 1897 was only 15 inches and some odds. This scarcity of rain together with the recent heat wave have inevitably rendered everything of the nature of scrub and grass extremely inflammable. Consequently bush fires followed, as generally occurs at this season, but this time it seems with more appalling effect than usual. Whole countrysides, it is said, are to be seen in flames for days, felling forests, devastating farms and settlements, schools, churches, etc., involving the loss of human lives as well as great numbers of stock of all kinds. An escape from the omnipresent fires seems and sometimes is, impossible, and tragic and melancholy are indeed many of the incidents related regarding the circumstances. Though New Zealand, Tasmania, and New South Wales have all suffered severely from the devastation caused by these apparently spontaneous fires, Victoria seems to have the largest areas affected, the severest form of the calamity being felt in the districts known as the Gippsland, "the Garden of Victoria." It is, however, the position of the individuals affected that command the greatest sympathy. Flourishing settlements, the scenes of many years of arduous toil, have according to the *Melbourne Leader* been wiped out of existence, leaving hundreds of families homeless; and over large areas "there is now neither food for the cattle nor, in many instances, cattle to eat the food if there were any remaining."

Over Southern Australia generally the season which is now coming to a close seems to be reckoned as more than usually unfavourable to farmers and fruit-growers. The rabbit pest is still a question of serious difficulty, notwithstanding the handsome rewards offered for the discovery of a successful and satisfactory method of diminishing it. Poisoned water and phosphorised food are, at the request of the Government, being tried as the latest remedial measures; but to these farmers especially have serious objections.

The San Jose scale recently introduced, it is alleged, with nursery stock from California is also causing no small anxiety and trouble in agricultural districts. A greater nuisance than this however seems to be the grasshopper plague, which consists, it is said, of several species, "all numerous and all hungry." They are so thick that "they can be taken up in shovel-fulls," and in places so numerous that "it is with great difficulty the trains are able to get up the inclines on the Railway line." At one place they have "killed an avenue of 2-year old pines and are now attacking pine trees that have been planted for 20 years."

* The dry climate and cloudless skies seem to make a difference; for as Pat said when reminded he was working in the field with the thermometer at 110 in the shade,—“Och, shure the thermometer has no effect on the heat in this land!” (South Australia).—*Ed. T.A.*

THE CACAO "TROUBLE" IN CEYLON.

A gentleman acquainted with cacao cultivation in the West Indies and interested in the welfare of Ceylon, writes:—

"I hope the disease in the cacao trees will be found not of a serious character. Cultural efforts promise the best results. There is apparently nothing more in Ceylon than appears now and then in the extensive cacao districts of the New World. Good draining and thorough sweetening of the soil by the use of lime and replanting with strong plants should bring things round."

This is very much the counsel given by Messrs. Willis and Green; but planters object that the trouble is present and persistent in what has been, for years, well-cultivated well-drained land, and where lime does not seem to be required. We have confidence that if anything of aspecial nature, can be done to combat the fungus, Mr. Carruthers will be able by-and-bye to advise judiciously.

"PLANTING IN SANTO DOMINGO."

OUR monthly periodical brings us into contact with all parts of the tropical and sub-tropical world. It is a link binding Ceylon not only to every British dependency cultivating tropical products, but also to a variety of countries outside the circle altogether of Queen's Victoria's rule. Our latest communication is from a subscriber who, as Engineer and Planter, is hard at work in the Republic of Santo Domingo, the Eastern half of the island of Haiti, with an area of 18,045 square miles—three-fourths of Ceylon—and a population rising to 700,000. From the "Statesman's Year Book" we quote as follows:—

Of the total area, about 15,500 square miles is cultivable. Tobacco culture is declining, while the production of coffee, cocoa, and bananas, as well as of cane-sugar is on the increase; some attention has recently been given to cattle-raising and dairy produce; the principal industries are connected with agriculture and forestry. Large sugar plantations and factories are in full work in the south and west of the Republic. Iron, gold, copper, coal, salt, and other minerals are found, but there is no mining industry.

The chief articles of export and the quantities in 1894 were:—Coffee, 860,000 lb.; cocoa, 426,000 lb.; sugar, 20,000,000 lb.; logwood, 512,000 lb.; lignum vitæ, 2,860,000 lb. The imports consist of cotton goods, hardware, earthenware, breadstuffs, &c.

Now for our correspondent M. Bogaert, who writes from Santiago, under date 15th January, as follows:—

I am very satisfied with your magazine that was recommended to me by a gentleman of Trinidad, and as I am a coffee and cacao planter I don't think it would be possible to find one more useful and interesting for me. Allow me to answer several questions of your referendum: how to economise the available labour supply:—

3. Only Company's estates can afford the expenses of steam and electrical tramway transport. I think that a well macadamised road of 10 to 12 feet width and with gradients under 7 to 8 per cent will do better for single planters. They cost me only 30s the 100 meters.

5. I have tried all systems and finally came to this one which gave me excellent results. I made an allowance of 25s per acre and per year; the profits on this sum are divided with my native foreman who is allowed to treat the weeding of parcels of 3 to 10 acres with his native people. Every sixth month we settle. This system brought me the weeding-cost down to 22s—the foreman's part inclusive—and my books show me a constant decrease of the cost. It must be understood that the price of labour is here 1sh, a day.

Although selected weeding may be good to struggle against certain rapid seeding weeds, I think that an advised planter, if by any accident he sees his estate

invaded by the weeds, will take the bull by his horns and make six three-weekly weedings, and after that he can rest and go over to monthly cheap weeding.

10-11. I think it is necessary to stimulate the needs of our working people putting them in the "boutiques," "tuudus," or shops useful goods before the eyes, so they acquire slowly the notion of civilised life; but I cannot condemn hardly enough the sell of "aquardiente," arrack, "pulque," etc., etc.—which is the source of all crimes of the natives and too, a source of difficulties between the planter and drunken labourers.

I saw in your magazine Mr. Green's suggestion to graft Caraccas cacao on Forestero. Has this been realized, and if so, please be so kind to indicate to me the manner it has been done.—ED. Bogaert, C. E., and Planter.

Mr. Bogaerts appears to be well off for labour which costs no more than 1s a day. We have not heard of any successful grafting being carried out as yet of Caraccas on Forestero cacao in Ceylon; but if such has been the case will hope to learn, with results, in answer to the present enquiry. We should be glad to hear from Mr. Bogaerts as to the prospects of Planting in San Domingo and how the staples pay as compared with the rest of the West Indies.

BUYING CATTLE IN INDIA.

MR. STURGESS AT BOMBAY AND KURRACHEE.

Mr. G. W. Sturgess, the Veterinary Surgeon of the Ceylon Government, returned from Kurrachee on 12th March after an absence in India of nearly a month. He went from Colombo by the M. M. ss. "Laos" to Bombay, starting on the 14th and landing on the 17th. Feb. Everything in that city, he said, seemed to be in confusion; he stayed at the Esplanade-hotel and there and every where he went there were evidences of precautions against plague, disinfectants of various kinds being freely used. At the Esplanade-hotel he found M. Ruinat, of the M. M. Company, residing: he was in good health and spirits. Mr. Sturgess saw funerals in Bonibay, "one after the other" and the whole town

SEEMED UNDER A CLOUD.

He left on the 18th for Kurrachee in the B. I. ss. "Dunera" and on board that vessel were 600 natives, who had been to Bombay to witness the departure for Europe of Aglakhan, a Persian prince. The natives (Mahommedans) were returning to Kurrachee and on arrival there the boat was boarded by six doctors (four male and two female), who examined every one on board,

WHETHER NATIVE OR EUROPEAN.

The result was that ten passengers were sent back (five men and five women), their temperature being too high. They were suspected cases only and there was no actual plague on board. All the natives were quarantined at Kurrachee, but the same rule did not apply to Europeans, who were allowed to land. Arrived at Kurrachee Mr. Sturgess set about selecting cattle and for that purpose visited the principal villages and settlements within ten miles of the town. For this purpose he scoured by hire a Kurrachee police camel. The cattle in the district were not in as good a state as they were last year, one of the results of the famine, but prices were about the same. In the district around Kurrachee there were no traces of plague and the effects of the famine were not very apparent. Mr. Sturgess secured his cows (32 in number) at 60 rupees each and also brought a bull, all being of the Scinde breed

He shipped them on board the ss. "Independent," which came direct to Colombo so saving the cost and risk of transhipment: and had a pleasant voyage home, until Cape Cornorin was seen, when the roll of the north-east monsoon produced a motion in the vessel not very pleasant. However the cattle were none the worse when they reached Colombo, none being lost on the way, and they were driven yesterday afternoon to the Government Dairy in good health. By the same vessel there arrived

FIVE HUNDRED SHEEP

which have been brought to Ceylon as an experiment in trading by an Indian merchant. The sheep are of the Scinde breed, black-faced and long-woolled. They cost in Kurrachee about R5 per head but it is understood that they will realise R10 here. They were landed in good condition.

Whilst at Bombay Mr. Sturgess visited the Veterinary College, where there are seventy students studying for veterinary degrees. Amongst them is one from Ceylon, Mr. Chinniah, who is reported to be doing very well. There are near the College splendid wards for sick cattle. Many of them were given by wealthy Parsees, and there is also on the premises a laboratory which is at the present time being used for plague inoculation.

A correspondent adds:—"The herd consisted of 32 cows (14 with calves) and a bull. Most of the cows are young animals, and it is to be hoped they will be found to be good milkers as the milk supply of the dairy is just now short of the demand from the hospitals."

RAMIE FIBRE.

In the course of an interview with Mr. Kershaw, who is visiting the Australian colonies with a view to opening up a trade in certain cotton thread fabrics, of which he is an extensive manufacturer in Manchester, the subject of fibre plants other than cotton was introduced. With regard to cotton, Mr. Kershaw said that it certainly would not pay to grow cotton in Australia for shipment to the home markets. The American grower got from 4 to 4½ cents (2d to 2½d) per lb for his cotton. But it was not so much the fibre that paid the farmer as the by-products, such as cotton seed oil, oil cake, &c. These were worth more than the cotton itself. Speaking of other fibres, he said he did not profess to be an expert in Sisal hemp, but the demand for it was very great—in fact, almost unlimited. The quotation in the home markets of £40 per ton, he said, should yield a very handsome profit even if the working expenses and charges amounted to fifty per cent. If one ton of clean hemp is obtained per acre then, at even £12 per ton, it should pay well. On the subject of jute and ramie, Mr. Kershaw was more emphatic. There is absolutely no limit, he said, to the market for ramie fibre. It was in every way superior to jute, and whilst the finer silk-like fabrics of jute, can be distinguished from pure silk, it is almost impossible to do so in the case of ramie fabrics. As to the price quoted—£30 per ton for clean fibre that was absurd. £30 per ton meant about 3½d per lb.; whilst the fibre commanded at least 6d per lb. in the open market, or £56 per ton. The improved machinery would even have the effect of increasing the price. Ramie was a fibre which lent itself to the most delicate fabrics, as well as to the coarser ones. From his knowledge of the trade, and from what he had learnt whilst in the colonies on the subject of the adaptability of the soil and climate of New South Wales and Queensland to the cultivation of the plant, he came to the conclusion that it was eminently worthy of attention—*Queensland Agricultural Journal*, Feb.

ROYAL GARDENS, "KEW BULLETIN" of Miscellaneous Information for November 1897, has just reached us. Its contents:—"West India Royal Commission; Miscellaneous Notes; Mr. J. H. Holland; Mr. W. Scott; M Ipighi Celebration; Botanical Magazine; Hop Horubeau; Tropical Fern House; Nephentes House; Durian in the West Indies; Lily Culture in Natal." The first article contains a great deal of very interesting information referring to the West India Islands visited and reported on. That of DOMINICA, administered by Mr. Philip Tenpler, is perhaps the most interesting to us. About it we read as follows:—

It is with the development of the other industries that the Colony will be mainly concerned in future. In this direction there is not only very good ground for hope, but considerable progress has already been made. The value of the exports of cocoa have risen from £6,375 in 1882, to £13,453 in 1896; of limes and lime juice from £5,102 to £14,851; of essential oils from £295 to £5,012; of fruit and vegetables from £607 to £1,348; and of coffee from £321 to £967 in the same period.

But this is not enough. If Dominica is to be self-supporting, if an efficient Government is to be provided for out of its revenue, and the people are to be prosperous, or even comfortable, these industries must extend still further; and there is happily, no reason why this should not be the case.

The great extent of the cultivable area of Crown lands has already been noticed. These lands are undeveloped; they are mostly covered with timber, much of which is said to be valuable. Care no doubt, ought to be taken not to create increased risks of landslips or floods by allowing too much of the highest lands to be deforested, for the rainfall in Dominica is heavy; but even allowing for the utmost caution in this respect, there is a great extent of land, especially in Layou and Sara flats, which may be cleared and cultivated. The soils of much of this is believed to be very rich and fertile, and the appearance of such patches as have been cultivated confirms the probability of its being so.

Some of this land ought to be disposed of under proper regulations to peasant cultivators, and some of it may prove attractive to investors of capital or persons who are in a position to occupy and cultivate estates of their own. The Government of the Colony will have to be guided by circumstances in the disposal of it; it is not possible, under present conditions to say what opportunities will arise which may lead to its being occupied and cultivated. At the time of our visit all sale of Crown lands had been temporarily suspended owing to negotiations which were then pending for a large concession to a Company. We believe these negotiations have fallen through, but in any case the sale of Crown lands to cultivators in the suitable localities ought to be resumed.

There is enough labour in Dominica for its present industries, but it is to be hoped that these industries, will increase, and, if so, their needs will soon outgrow the capacity of the present labour supply. By the time, however, that this takes place there will, we fear, be only too many persons in other islands in want of employment, and it should be easy to import many labourers from them.

The present condition of Dominica is certainly one of depression, and it will need assistance from the Imperial Government. This may be given as part of a general scheme for subsidised steam communication between the islands, and of a special scheme for opening direct communication between St. Vincent, Dominica, and New York.

Dominica will also share in any assistance which may be given to the system of botanic institutions in the West Indies. In addition to this the island should

have some assistance from Imperial funds for making roads, which are essential to its progress. Such help need not be very costly, and need not be grudged, since Dominica may, if such assistance is given, be expected to attain a state of comfort, or even prosperity, and its capabilities and prospects are decidedly better than those of any other of the Leeward islands.

Here again is a most important chapter, full of warning to Ceylon as well as to any part of the West Indies:—

DANGER OF DEPENDING ON A SINGLE INDUSTRY.

The recommendations involving expenditure by the mother country, which we have considered it our duty to make, are based primarily on the present and prospective depression of the sugar industry in the West Indies, but they are of such a nature that they should, in our opinion, be carried out even if the sugar industry were restored, temporarily, to a condition of prosperity.

It is never satisfactory for any country to be entirely dependent upon one industry. Such a position is, from the very nature of the case, more or less precarious, and must in the case of the West Indies result in a prepondering influence in one direction tending to restrict development in other ways.

The representatives of the sugar industry in the West Indies have had special means of influencing the Governments of the different Colonies, and of putting pressure on the home Government to secure attention to their views and wishes. Their interests have been to a very great extent limited to the sugar industry, and they have seldom turned their attention to any other cultivation except when the sugar industry ceased to be profitable. The settlement of the labouring population on the land, and the encouragement of the products and forms of cultivation suitable for a class of peasant proprietors formed no part of their policy; such measures were generally believed to be opposed to their interests, which they regarded, no doubt, as identical with the best interests of the community, and in, at least, some of the Colonies met with opposition at their hands. If a different policy had found favour, the condition of the West Indies might have been much less serious than it is at present in view of the probable failure of the sugar industry.

The general statement regarding the danger of depending on a single industry applies with very special force to the dependence of the West Indian Colonies upon the sugar industry, for the cultivation of sugar collects together a larger number of people upon the land than can be employed or supported in the same area by any other form of cultivation. In addition to this it also unfits the people, or at any rate gives them no training, for the management or cultivation of the soil for any other purpose than that of growing sugar cane. The failure, therefore, of a sugar estate not only leaves destitute a larger number of labourers than can be supported upon the land in other ways, but leaves them also without either the knowledge, skill, or habits requisite for making a good use of the land. In those Colonies where the sugar industry cannot be carried on without imported coolie labour the position of dependence upon this one industry is still more dangerous. In these cases not only is there a yearly charge upon the public revenue to meet the cost of immigration, but a liability for back passages is incurred, which a failure of the industry would leave the Colony without funds to meet.

Whilst, therefore, the vital importance of the sugar industry to the present prosperity of nearly all the Colonies is beyond dispute, we wish to observe that so long as they remain dependent upon sugar their position can never be sound or secure. It has become a commonplace of criticism to remark upon the perpetual recurrence of crisis in the West Indian Colonies, and we submit that the repeated occurrence of such crisis, as well as the fact that the present crisis is more ominous than any of the previous ones, illustrates the danger to which we have referred, and adds much force to our recommendations for the adoption of special measures to facilitate the introduction of other industries.

LABOUR FEDERATION AND COAST ADVANCES IN CEYLON.

Report of the Joint Committee of the Ceylon Chamber of Commerce and the Planters' Association of Ceylon appointed to consider the question of Coast Advances to Estates Kanganies and Coolies with a view to their reduction.

The Joint Committee of the Chamber of Commerce and the Planters' of Ceylon have received the following replies to their recommendations, viz.:—11 replies from Colombo Agency Firms, 16 from District Associations, and 4 from Managers of Companies. Of these 25 were in favour of recommendation (a), and 3 against it; 27 in favour of (b), and 3 against; 28 in favour of (c), and 1 against; 13 in favour of (d), and 13 against, 25 in favour of (e), and 4 against.

The Joint Committee finally recommend the adoption of the following resolutions:—

(a) To make Coast Advances a matter of yearly settlement, this not implying that outstanding advances can in all cases be fully recovered, but that on all Estates there be a yearly reckoning and adjustment of advances as between Estates and Kanganies and Coolies.

(b) To adopt a system of Monthly Payment of Coolie wages within say 35 to 40 days, and in any events to make payments every two months.

(c) To send advances direct to the Coast as far as possible, and to consult the convenience of the previous employer before taking on any local labour.

The Committee would further suggest the desirability of recovering a certain proportion of advances each pay day when practicable.

The Committee have advisedly omitted recommendations (d) and (e), the former because it has been disapproved of; the latter because, on full consideration, it appears to the Committee inadvisable to continue a suggestion which seems to approve of the interference of the executive with the Police Magistrate.

The Committee, in conclusion, would, in the interest of all concerned, recommend these resolutions to all Resident Proprietors and Superintendents; and would urge upon Agency Firms and Managers of Companies to assist, so far as lies in their power, in carrying them out, as the Committee are of opinion that, in many instances, it lies to a great extent with them to give practical effect to the Committee's suggestions.

Resolved:—"That the rules of the proposed Federation, and the accompanying memorandum of the Joint Committee re coast advances be printed, and copies sent to the Hon. Secretary of every District Association for distribution to all planters in the respective districts with a request that each planter be invited to enroll himself as a member of the Federation."

MEXICO AND ITS DEVELOPMENT BY CEYLON PLANTERS.

One result of the establishment of an artificial, disunited rupee in India and Ceylon has, undoubtedly, been to send capitalists hitherto interested in the East, to seek investments in "silver" countries of the Far West. Messrs. H. K. Rutherford, G. A. Talbot, and other gentlemen well-known in Ceylon have given attention to Brazil and invested freely in extensive coffee property there; Mr. Huntly Thring, Mr. J. L. Shand, Mr. R. P. Macfarlane and others have made an investment in Costa Rica; and now an influential Syndicate of Ceylon men have—according to our London Correspondent—completed the purchase of coffee property in Mexico. It is well that these facts, and many more similar to them, should be brought under the notice of Mr Chamberlain and Lord George Hamilton to give them some idea of what India and Ceylon have lost,

and are losing, through the transfer of capital and planting enterprise to America, which would surely have been given to the East had the Currency not been tampered with.

Of all American lands, it is likely that Mexico will prove the most attractive from this time onwards to our planters and capitalists. It has made wonderful strides in progress during the past twenty years under President Diaz—a born ruler of men, a firm and wise administrator. A generation ago, scarcely a road in Mexico was safe from banditti, who robbed and murdered with impunity. Now order and justice everywhere prevail, and as a London contemporary puts it:—"today, great railways, connected with the American trunk lines, traverse the country, thousands of tourists from the United States make the spring excursions to Mexico to enjoy a bracing climate and a life more picturesque in incident and colour than more northern climes afford, and travel in every part is—by the admission of Americans—more secure than in some of the South-Western States and Territories of the Union." Then how few of us realize what a great country Mexico is with its 767,000 square miles (equal to thirty Ceylon's), magnificent climate on the extensive plateaux, enormous mineral wealth and rich agricultural regions. *Two-thirds of the whole silver stock of the world*—says the *Spectator*—has come from Mexican Mines; and at present general prosperity prevails with cheap living in view of a plentiful silver currency.

Of course we, in Ceylon, are most interested in the planting development of certain Mexican districts. Our Correspondent, Mr. W. J. Forsyth (formerly of Matratta and Uva) has kept the readers of the *Observer* and *Tropical Agriculturist* for a long series of years back, fairly well acquainted with the coffee planting enterprise of Guatemala and Western Mexico; and later Mr. Laing Malcomson (who was also for a short time in Ceylon) has appeared in London as a promoter of investments in Mexico. Very wisely, the gentlemen who turned their attention to coffee in Mexico sent out trustworthy agents of their own in Messrs. Naftel, Clark, Fort, &c. and as a consequence "Tapia" estate in Cordoba district has been purchased. Of this investment we are sure to have some information later on. Meantime, we are a good deal to blame for neglecting to notice before now a very interesting practical book on "Mexico, its Progress and Commercial Possibilities" by Mr. E. J. Howell, F.S.S., kindly handed to us by Mr. W. S. Saunders on his return some time ago from England. We are told how Mexico embraces every climate from the temperate to the tropical, and how, with the exception of a narrow border of sea-coast, it is a lofty table-land between two oceans, rising to 4,000 and even 8,000 feet above sea-level, having therefore hot, temperate and cold zones and divisions. We must not on the present occasion do more than refer to the chapters referring to the sub-tropical products—coffee, cacao and rubber—in which we are most interested; and we cannot do better than quote as follows from our author:—

COFFEE.—If there is one product for which Mexico offers the best conditions for its perfect growth, in the matter of soil, climate, and altitude, it is coffee. Experience has proved that the best flavoured and heaviest coffee is produced by these conditions, together with a proper cultivation and preparation (or curing) for the market. All the coast States of Southern Mexico, of both the Gulf and the Pacific Coast, have excellent soil and climate for the growing

of coffee. Coffee is raised principally in the States of Chiapas, Vera Cruz, Morelos, Oaxaca, Michoacan, and Colima, and can be grown in several others, while portions of Colima, Michoacan, and Chiapas, have perhaps the best conditions for successful culture. The coffee of Uruapam (Michoacan) is celebrated, and is considered by connoisseurs to be finer than Brazilian coffee. The exports to the United States of this bean, during the fiscal year of 1887-88 amounted to \$2,117,299. The total exports for the year 1888-89 were valued at \$3,886,034. The rapid growth of the industry may be seen by noting the exports of the last few years:—

1887-8	\$2,431,025
1888-9	3,886,034
1889-90	4,811,000
1890-1	6,149,808

Of this last amount the United States took \$3,542,851, whilst a very small amount was sent to England. The enormous increase in production during the last ten years indicates a corresponding growth of prosperity, as, whilst the expenses of cultivation are small, the profits are large.

The price of land suitable for coffee plantations is low, and may be purchased over a large area. The prices for suitable first-class land are:—

The State of Vera Cruz	..	\$1.13 per acre.
" " Colima	..	0.90 "
" " Michoacan	..	0.90 "
" " Chiapas	..	0.62 "
" " Oaxaca	..	0.44 "

Two companies, one English and one American, have lately been established to cultivate coffee in the State of Oaxaca. In Chiapas the landed proprietors are increasing their coffee plantations, and have organised an association for protecting this industry. In the district of Soconusco in this State, there are now 26 Coffee plantations, which employ 1,520 men. The owner of one of these plantations states that there are sufficient coffee lands in that district still unoccupied to produce at least 200,000 quintals of 100 lb. each of the berry. The cost of growing would not exceed \$5 per quintal, or 5 cents per lb. packed in sacks and ready for transportation and as it finds a quick sale at the plantation at 20 cents, there is a profit of 15 cents per lb. at present in this industry. The coffee tree begins to yield the third year, but is not generally in full bearing until the fifth. The cost of the early cultivation is often covered by planting bananas between the rows, which forms a shelter for the young trees during their growth, and more than covers all the expenses of the plantation, as this fruit commences to yield the first year after planting.

Concerning coffee culture in Mexico, the following data is taken from a book entitled "Coffee Culture on the Southern Coast of the State of Chiapas," published by Senor Don Matias Romero, in the City of Mexico, August 1875:—"The cost of each coffee tree, four years after planting, including value of public land and wages, at the rate paid then in Soconusco is about 11 cents per tree. The yield of each tree in its fourth year is two pounds of coffee, which, at the minimum price of 10 cents per pound, is 20 cents; expenses of gathering the coffee beans and other expenses until the coffee is delivered to the market, 5 cents per tree. Net profit 15 cents per tree." Coffee husbandry will therefore form one of the most remunerative of Mexico's agricultural products, as there is a vast area specially adapted to its culture lying adjacent to ports, from which shipments can be conveniently made to Europe.

RUBBER.—Rubber planting is very profitable, and is largely increasing, especially in the States of Chiapas, Oaxaca, Vera Cruz, Tabasco, and Guerrero. In the first-mentioned State, on the Pacific coast, there exist extensive forests of rubber trees, which are only necessary to tap in order to obtain the substance. It is estimated that Mexico could easily produce 10,000 tons per annum, which would command the same price as the best quality of Peru rubber, for the trees are identically the same as those in Brazil. It only requires the same treatment after the gum is extracted

to produce an equal quality rubber. The present method of collection is by the Indians, who sap both the rubber and the trees by their unscientific and wasteful methods. The rubber is cured in a primitive fashion, both the good and poor qualities being mixed together. Labour is abandoned and can be readily instructed to collect and cure the rubber to produce better quality, which being done, would largely increase the demand for Mexican Rubber. The Mexican Minister in Washington owns large tracts of land in Chiapas, where he has planted largely, and obtains a considerable and steady revenue from his estates. It is a tree which gives little or no trouble in cultivation, requiring no preparation of the land, as it seems to prefer poor and arid soil. In fact, it yields a finer quality rubber if it is planted under such conditions. The cost is about £9 to £10 to plant an acre with 300 trees, which is about the largest number to plant without overcrowding. The average yield of sap from a tree in four or five years is six lb. giving a total of 1,800 lb. to the acre; this would boil down to about 300 lb. of solid rubber, and when sold would realise about £24, giving, say, £20 net profit to the acre. This profit would gradually increase until the yield would more than double in the eighth and succeeding years.

COCOA.—Cocoa-planting is one of the oldest industries of Mexico, for the cocoa palm, known botanically as *cacao theobroma*, is indigenous, and was largely cultivated by the Aztecs. It is a source of considerable revenue to Mexico, for like most other agricultural industries in the country, where labour and land are so cheap, the cost of growing is proportionately low. Over 400 trees can be planted to the acre. There is a small return in the third and fourth years, but the yield is large enough in the fifth and sixth to pay all expenses with a little over. In the seventh year the trees are in full bearing, continuing so for 30 years and over. The trees like lemons, bear buds, flowers, and fruit at the same time, so that ripe pods may be collected at any time, but there are periodical harvests depending on the dryness of the weather. Each tree yields about 60 pods which contain from 20 to 30 beans, which should give about 13 to 14 lbs. of cocoa beans, or an aggregate of nearly 7 cwt. per acre, and consequently pays handsomely. The cocoa bean is chiefly cultivated in the States of Tabasco and Chiapas. The best is grown round the Port of Soconusco, near the Guatemalan frontier, and is considered by connoisseurs to be of the finest quality grown. Its flavour and natural richness commends it to manufacturers in England. Chocolate sells at Soconusco for 20 cents per lb., and an excellent opening is offered for the cultivation of the cocoa tree on a large and systematic scale.

Mexico had a population at the Census of 1895 of close on 13 million—19 per cent being pure white race; 43 per cent mixed; and 58 per cent of Indian race. Mexico, the capital, is a town of 350,000 people, of whom perhaps 8,000 are foreigners. The following passage from the latest Statesman's Year-book is of interest in this connection:—

Government has assisted in introducing plants of vines, olives, and other fruit trees, while seeds of vegetables and of silkworms have been distributed gratuitously. The chief agricultural products are rice, maize, barley, wheat, beans. The cultivation of cocoa, coffee, and tobacco is extending. In 1893-94, 18,568 tons of coffee were exported from the Republic; in 1894-95, 16,247 tons; and in 1893-94, 356 tons of manufactured and 1,596 tons of raw tobacco were exported; in 1894-95, 360 and 929 tons respectively. Heneguen is grown chiefly in Yucatan. The fibre exported in 1894-95 amounted to 147,984,457 lb. Other products are cotton, sugar-cane, vanilla, cacao, indigo, rubber, bananas. Large numbers of cattle are reared in Mexico for the United States. In 1883, in Northern Mexico alone, on an area of 300,000 square miles, there were 1,500,000 cattle 2,500,000 goats, 1,000,000 horses, and 1,000,000 sheep. In the whole of Mexico in 1883 there were 20,574 cattle ranches, valued at 103,000,000/.

Mexican is rich in minerals, gold, silver, lead, iron, copper, quicksilver, tin, cobalt, antimony, sulphur, coal, petroleum, being either worked or known to exist. There in the country (April 1, 1894) 3,167 mining enterprises, of which two-thirds belong to Mexico companies or individuals, and the rest to foreigners.

In 1893 there were in Mexico 2,899 factories for sugar and brandy; 123 for woollen and cotton yarns and textiles; 41 for tobacco; the total number of factories being 3,844.

In 1893 there were nearly 7,000 miles of railway open, and 127 miles of tramway, besides a large mercantile marine. Telegraph lines covered 41,000 miles and there were 1,560 Post offices. All this will show how far advanced Mexico already is, and yet the scope for further development agriculturally—and especially in tropical planting—is very great; while the proximity to American and European markets gives an immense advantage to producers.

RUSSIAN TEA BUYERS IN CEYLON.

Mr. Isgaresoff and Mr. Daniloff, representatives of the well-known firm of Messrs. Popoff, arrived in Colombo by the ss. "Polynesian" and were met by Mr. A. H. Thompson, the tea-maker, with whom they have been engaged the greater part of the day testing tea for Wednesday's sale. Mr. Isgaresoff proceeds to China and Mr. Daniloff remains in Ceylon to do business in the Colombo market.

AMSTERDAM BARK MARKET.

Our Amsterdam representative wires us this afternoon that the result of the bark auctions in Amsterdam today was a drop in the unit of 1.4 Dutch cents, per half kilo., the average unit today working out at 5½ cents. (1d. per lb.), against 6.9 cents. at the last auction, a decline of over 20 per cent. It must be remembered, though, that only 2,953 packages were sold out of 6,547 offered, so that a large proportion of the bark appears to have been firmly held. The lowest price obtained for *Manufacturers' bark* was 10 cents, and the highest 46 cents, and the lowest for *Druggists bark* 8 cents, and the highest 90 cents. The tone of the auctions was quiet. Below in tabular form we give the total quantity of quinine (in bark form) offered and sold, and the names of the chief purchasers with the amount of bark they purchased stated in quinine equivalent:—English and American Quinine factories (principally) 1,891 kilos. Auerbach factory, 1,282 kilos. Brunswick factory, 3,248 kilos. Mannheim and Amsterdam factories, 4,269 kilos. Frankfurt and Stuttgart factories, 70 kilos. Miscellaneous buyers, 1,533 kilos. Total sold, 10,690 kilos. Bought in or withdrawn, 18,257 kilos. Total offered, 28,947 kilos.—*British and Colonial Druggist*, Feb. 25.

PRODUCE AND PLANTING.

THE TEA TRADE OF FORMOSA.—Mr. Davidson, the United States Consular agent at Tamsui, Formosa, in a report to his Government, gives some interesting particulars about the tea trade of the island. It is stated in the report that, out of a total yield of some 450,000 half chests (18,900,000 pounds) for the season, more than half have been settled on the Tamsui market for foreign firms the remainder having been consigned to the native brokers tag Amoy (a Chinese port lying directly across the Channel from North Formosa) for disposal on that market, where teas are sold in blocks of several hundred each, and the buyer is obliged to take the whole string, good and ad. Such of the purchase as is below the standard then usually returned to Formosa, where it is mixed

with a good quality of green leaf and takes its place later with the others as a grade up to the standard. Of the total export, it is estimated that over 90 per cent goes to America and the balance is distributed between Great Britain and the Straits Settlements. The Chinese control the Straits Settlements trade, so that for all practical purposes it may be said that the foreign tea houses are exclusively engaged in supplying the American market. The handling of the trade is divided among five foreign firms, who, with one exception, have their head offices in Amoy and branch offices in Formosa. For several years none but English firms have been engaged, but two years ago an American firm succeeded an English firm in Tamsui and they have already been able to obtain their share of the trade. There has been no serious attempt made on the part of the Japanese to enter the tea business either as planters, packers, or exporters, with the single exception of one company, which packed some 12,000 half chests to be disposed of to the foreign firms and made two small shipments totalling some 800 half chests (33,600 lb) of autumn teas to America via Kelung and Yokohama. It would seem difficult at the present high rates for freight first to Kelung and from there to Japan for Japanese to compete with the other exporters, if the Japanese continue to send their tea via Kelung and Japan, instead of Amoy, as is done by the foreign exporters.

AMOY AND THE FORMOSA TEA TRADE.—Amoy, China, is dependent to a great extent upon the Formosan tea trade for its prosperity, and there has been some apprehension in that port as to the likelihood of Formosa absorbing a large share of their business by making direct tea shipments to America. It would appear, however, that there is no probability that such will occur for some years to come. In order that this may be understood, it is necessary, said Mr. Davidson, to explain the peculiar condition existing in North Formosa. The present centre and most convenient station of the tea district is Tawatutia (a suburb of Taipeihu, the capital). After the tea has been packed and rolled sufficiently to permit of its transport, it is carried to the hongs at Tawatutia where it is fully prepared for foreign markets. Down the river to Hobe, where the shipping is done, is an easy sail of some ten miles for the cargo boats, and there the steamers, lying in quiet waters, are loaded with perfect ease and convenience. The cargo-boat charge to Hobe is about ¾d per half chest, and the freight to Amoy 2½d. At Amoy the large American-bound steamers find it not much out of their way to call in for the tea which has there been packed ready for the foreign markets. With the facilities for loading in that harbour, they are only detained a few hours. Formosa can offer no such advantages. Tamsui harbour (Hobe) admits only vessels which draw less than 13 ft., while Kelung, in the present condition of its harbour, is unsuited. The harbour is being improved, but it will require many years before the work is finished, and even then there are other difficulties nearly as great. At the suggestion that the final packing of tea be done in Japan it would seem necessary that railway running to Kelung be prepared with big trains, useful only during the tea season, to carry the tea to Kelung at the same rate as the cargo boats charge to Hobe—¾d per half chest—and that steamers carry it to Japan for the same rate as it is now carried to Amoy, 2½d per half chest—for the reason that the rate from Japan to America and Amoy to America are about the same. Steamers cannot, however, carry tea from Kelung to Japan proper for 2½d and pay expenses. Again, it has been said that the American steamers would call at Kelung and pick up the teas as they do at present at Amoy. But it seems unlikely that Kelung can be made as safe and quiet a harbour as Amoy, and even were it accomplished, it seems improbable that the American steamer would care to take the journey around the storm-ridden shores of North Formosa, if the tea could be obtained at Amoy.

Upon the establishment of the Japanese administration in Formosa, the people were relieved from all taxes for one year. At present, however, taxes are again imposed, including a tax on tea. The impost is 2.40 yen (5s) per picul (133lb), which, with the addition of the customs-export tax of 1.10 yen (2s 3½d), gives a total impost of 3.50 yen (7s 2½d) per picul (133lb.) Although this is larger than the Japanese mainland tax, it is small compared with either the old tax in the island, 6.20 yen (12s 11d), and the present Amoy tax, 6.85 yen (13s 5d).

THE INDIAN TEA ASSOCIATION (LONDON.)

EXTRACTS FROM MR. BLECHYNDEN'S REPORT FOR
THE YEAR 1897.

Mr. Blechynden, in his annual report for the year 1897, addressed to the Secretary of the Indian Tea Association (London,) says:—

JOINT ACTION WITH CEYLON.

It affords me great satisfaction to be able to state that the complete alliance with the Ceylon Association, which was entered upon in 1896, continues in full force and has remained upon the most harmonious footing. This solidarity has been a great source of strength to both Associations in their relations with the trade here. This aspect is as important as the financial side of the question. From the latter point of view alone the working power of the two Associations combined has been more than doubled.

SUBSIDIES.

As progress in the taste for our teas in this country shows itself more and more as time passes, we have been able to modify the system of giving subsidies or grants in aid to firms handling and pushing them. When we made our first steps in this direction our aim was to encourage firms not hitherto interested in India and Ceylon teas to identify themselves with their introduction here and thus secure the machinery at their command to that end. We had also to offer some encouragement to some firms already in that line of business to continue efforts which had in many cases not proved very remunerative. The plan has worked very well, but has the objection that it is liable to abuse and we have more recently preferred to follow it in a modified form. As pointed out in my last report, the system of grants insures the expenditure of each sum under proper supervision, and work can be done and territory covered which would cost the association a great deal in salaries and expenses to supervise were it done directly.

TRAVELLING.

During the year I have visited most of the large centres where work is going on at different times, and they have been visited by Mr. Mackenzie independently. This work of inspection is very useful and should be done more frequently than I have been able to spare time for. It is only by actual inspection of the work as it goes on that we can be satisfied that the spirit as well as the letter of our arrangements are being carried out. During the summer, when there was but little to do here, I visited London and had the advantage of personally meeting the committee. While in London I called upon some firms and had the satisfaction of interesting at least one of them in the American work, which I had not heretofore contributed towards it.

LETTERING STORES.

The work in this direction has fallen off considerably. This is due to several causes. The firms who used to apply to us on behalf of the grocers are now nearly all engaged in pushing packets of their own, and are not desirous to give prominence to "India and Ceylon Teas" in a general and not in a particular way. Many firms have letters similar to those we use for their packet goods. Finally the teas are now pretty generally sold by grocers, and is not an uncommon thing to which special attention has to be drawn. There are many storekeepers—who hang up rough paper signs in their windows, calling attention to different things at different times—who now include our teas in such notices.

SHOWS AND DEMONSTRATIONS.

As the system now adopted throws all such work as would come under these heads into the hands of packet and other tea houses, the small expenditure incurred under these heads was very early in the year under review.

ADVERTISEMENTS.

The expenditure under this head is by far the heaviest item in the accounts for the year, being more than double that of any other item, and equal to about two-thirds of the entire expenditure under all other heads put together. As has been stated in another part of this report printing has been charged to this head; the balance consists mainly of two items—newspaper and magazine advertising. Under this head, too, have been charged several special advertisements which have appeared in souvenir programmes, such as that for the inaugural ceremonies at Washington, during the installation of Mr. McKinley as President, and others of less importance. During the summer months we had a Vitascop advertisement running in a prominent situation on Broadway in the heart of the theatre district. Of course such things are displayed at night only. This advertisement attracted a great deal of attention, as it is comparatively new to have such displays, and we succeeded in making ours very striking and dramatic. As an advertisement of 200 dols was offered for a poem of twenty lines, descriptive of Indian and Ceylon tea. Over 5,000 essays were sent in, and a committee awarded the prize to the successful competitor. As regards newspaper and magazine advertising I have little to add to my report on this subject on the plan we adopted in 1896. We have changed many of the magazines we then used and taken up others, but the aggregate circulation is probably about the same. In addition to the daily newspapers we have space in the leading commercial journal of this country, published in New York, which we use as we require it. The statistics of the tea imports into this country we published in this paper for the first time, and that advertisement caused a good deal of comment, the facts not being at that time thoroughly realised even by people in the trade. We were able to show that the consumption of our teas in North America had increased by about 54 per cent. in two years, against a decrease of 13, 40, 23, 13, and 53 per cent. in the consumption of other teas, the only kind besides ours showing an increase in the same period, Formosa Oolongs, having gained 13 per cent. The final or actual figures were not at the time and are not yet available, but closer estimates can now be made and even in the last case we will be able to show that there has been a falling off and not an increase

in the consumption of Formosa teas, some five million pounds, it is now estimated, having been shut out from this country by the action of the New Tea Law and the regulations in force.

GENERAL REMARKS.

In the last paragraph I referred to the New Tea Laws. Soon after they came into force it was found that the regulations intended to give them effect were so framed that they would exclude practically all but our coarse teas. These regulations read that our teas were to be tested with a number 16 sieve, and when more than 10 per cent. of leaf passed through the meshes it was to be classed as dust, and the tea either rejected or the excess "dust" removed before importation. I had to deal at such length with the matter at the time in my letters to the committee that it is needless for me to enter upon it again here, or to point out the hardship and injustice of this rule. It was not so much the actual harm that was done at the time (though one firm alone had some 45,000 lb of packet tea excluded at one time), but the effect of the rule on firms importing tea was to leave them in doubt as to what would be passed as tea and what classed as dust. The order hit the packet firms particularly, as in their case when tea was found to contain more than the 10 per cent. of fine leaf each packet would have to be broken open, the tea bulked and passed through the sieve, and then re-packed. After a good deal of trouble and much agitation and pressing the rules were revised in our favour, for which it was necessary to convene a meeting of the merchants, who acted as an advisory committee to the Treasury Department in drawing up the rules.

Owing to the circumstances surrounding the case the tea importers most deeply interested found that they could not act as vigorously as they might wish to do, and the active work therefore rested with the associations, which being independent bodies, had nothing to gain or fear from being in a position of seeming opposition to the wishes of important members of the trade. The position I was forced therefore to occupy for a time has brought me a recognition far beyond anything I merited from some of the leading importers, who the day before Christmas presented me with a very handsome letter and a cheque for 50000s. to mark their appreciation of what the associations had done.—*H. and C. Mail*, Feb. 25.

OUR TEA INDUSTRY AND A YEAR'S LOSSES.

We preached "caution" the other day in view of the outlook in the local money market. "A Man of Business" emphasizes the lesson after a startling fashion in dealing elsewhere with our staple planting industry. He shows that the tea planters of Ceylon have received, approximately, ten million rupees less in 1897 than in the previous year for their produce; and he rightly infers that if exchange is to continue as adverse as at present and if prices do not improve, the outlook for our planters is a serious one. Already, we hear the question of abandoning tea fields yielding less than 300 to 350 lb. per acre is being considered, and certainly there should be a warning to our authorities, both here and at home, in the *figuresso* far adduced, and in the outlook so far as it can at present be estimated. "Caution" in dealing with the general revenue ought to be a primary consideration.

MEXICAN PRODUCE AND ESTATE SYNDICATE, LTD.

This Company, of which our readers have already heard through the letter of our London correspondent, is going in for a very large increase of capital.

This Syndicate was (says a contemporary) formed in October, 1897, to take over certain options to purchase properties in Mexico, and to send out an experienced Ceylon Planter, to report upon same, with the view of subsequently forming a larger Company to purchase such properties as were reported upon favourably, and which could be obtained on reasonable terms. The Syndicate secured the services of Mr. Cecil O. Naftel, who is well-known in Ceylon, having held for many years the responsible post of Inspector and Valuer of Estates in that Colony. Mr. Naftel proceeded to Mexico in November last, accompanied by several other Ceylon Planters interested in the Syndicate, and the results of his inspections so far are favourable to several of the properties reported upon, but inasmuch as the owners are disinclined, at present, to extend the options for such a period as would enable the Syndicate, if the shareholders thought fit, to form a larger Company for the purpose of acquiring them, it is submitted to the shareholders, that the best course to pursue is for the Syndicate to make a start by themselves by purchasing one property outright, and the "Tapia" estate has been selected, as the most desirable under the circumstances. Mr. Naftel's very favorable opinion, it is stated, is shared by Messrs. John Clark and J. G. Fort, both experienced Ceylon planters, who have lately returned from Mexico, having visited that country in order to satisfy themselves, by ocular proof that coffee cultivation there answered to the favourable descriptions given of it. As compared with Brazil, the advantages of coffee cultivation in this district of Mexico are declared to be immense—labour, transport, and freights are as cheap, or cheaper, whilst the quality of the coffee is so much superior to that of even the finer grades of Brazil coffee, that at the present time, when Brazil coffees are fetching prices of from 30s to 40s, according to quality, the product of the "Tapia" estate finds buyers at from 65s to 85s per cwt., sales having recently been made in Mincing Lane at these prices. The Syndicate has the offer of the estate for \$300,000, inclusive of the present crop which is almost ready for shipment, but the Directors hope to obtain some reduction in this price. According to Mr. Naftel's estimates, which the Directors are satisfied have been made with great prudence, the nett income from coffee alone during the coming season (1898-1899 crop) will be fully \$40,000, on the basis of the above value of 55s. per cwt., besides which the Directors are informed there was last year a profit of \$6,000 from sundry sources, cattle etc., which amount this year should be larger. After allowing for interest on the Mortgage Debentures, and the London expenses of the Company, this will leave a return of not less than 10 to 12 per cent on the share capital, and were the present market value for this coffee realised, the returns would be considerably larger. The proceeds of the in-gathered crop of 1897-98, which is, as already stated, included in the price to be paid for the estate, will be utilised as working capital, and for opening out new coffee plantations. The amount thus realised should be ample for all requirements. As the Syndicate is

purchasing the estate direct from the owner, there are no intermediate profits, and the whole of the purchase money will be paid to him, plus a small commission to Messrs. Wm. Young & Company, who effected the introduction. In due time, as opportunities offer, it is the intention of the Directors to acquire other first-class properties, which will involve the formation of a larger Company, by which the shareholders of the present Syndicate are to greatly benefit.—Local "Times."

NILGIRI TEA.

Mr. George Christison, the well-known Darceeling planter, who recently made a short stay in Coonor, gives the following opinion on Nilgiri tea: "I like your District in many ways. Your soil generally is very good, and your tea looks healthy and well. Of course without being with you all the year round, I cannot form any very reliable opinion. . . . As you must know, your tea has not been in good favour in the London market. This may, I think, be remedied in some measure."—*M. Mail*, March 15.

CEYLON NORTHERN PLANTING DISTRICTS.

(Communicated.)

CHANGED TIMES—THE OUTLOOK FOR TEA—LABOURERS NO LONGER RULE—NATIVE TEA GARDENS LIKELY TO CLOSE—BRIGHT-EYED HOPE!

Just at present the climate of the districts of which the Knuckles may be taken to be representative is matchless, bright, cool, and still. The outline of the hills is very sharp against the sky, and the shadows are wonderfully distinct. It is not always like that in this quarter; more than usually favoured with rain for the last two years, a dry season like the present is all the more enjoyed, and the flush which is vigorous and plentiful indicates how willing the trees are to respond. Tea however is somewhat under an eclipse, and when it is mentioned it is not with that fond respect that was wont to be. The question is "Where are we bound for?" and anything from a hard, worrying struggle to out-and-out bankruptcy and abandonment, is the answer given according to the disposition and temperament of the answerer. When every planter's eye has been opened, and got concentrated on the tea problem, it is not much in the way of a fit fact that is overlooked, and when you have had a series of doses of doleful ditties, all on the one subject, it becomes a little monotonous, not to speak of depressing and if you can't see any clearer way out of it, just take refuge in the comforting thought that "it is the unexpected that always happens." All the same the outlook is serious enough, and you hear of the stirring of Company Directors issuing orders for impossible quantities at or over market average--that delightful combination of quantity and quality combined, which would suit Managing Directors and find the dividends, the shareholders demand. "You must do it or die" is the stern mandate "and I give you a year to accomplish it." Accomplish the impossible! What a task! Clearly the times are out of joint, and we will all have to hustle, to keep step to them.

Even the Coolie who has had his innings is now finding out that he has reached the end of his tether, and the changed tea horizon is reducing Ramasami from the glorified individual he was when labour was much needed, back into his normal state. The gangs that are heavily indebted are handed "tundus" and invited to seek pastures new, a clear manifestation that there is a fear abroad that "to hold the baby" now, is rather precarious. These silver-gilt Malabars, don't find that there is anything like the former willingness to pay up anything that may be asked, and after much wandering and eye-opening they come back—unsuccessful. Here the trouble does not end, for with a debt which they can never work off, and the caddie keeps hungering for blood, and threatening law proceedings, the place gets rather hot for the silver-gilt, and they incline to fold their tents like the Arabs, and silently steal away.

There is likely to be a good deal of bolting of small gangs, and a loss of coin therefrom. Those Companies who some time ago were prepared to give any advances, and had no hesitation to lavish out, now that dividends are difficult to earn and the Directors' fees are sacrilegiously handled and questioned, will, perhaps, postpone writing off lost advances, but it will have to be faced. It will be a happy day when the kangau, who would come up to the bungalow—or meet you on the road with a cough to attract attention, and ask for a thousand rupees, and when you demurred, insinuated a "tundu"—when a high-flier of this kind,—finds that *that* style is wholly gone out, it will be a good thing. The "sweet uses of adversity" will appear in time when the planters' attention, which is at present wholly concentrated on probable losses, has relaxed a little and the horizon widened; for, it is a blessed law that there is compensation for most things.

The new clearings—native mostly—are still on the increase; but if prices are to keep down, it is evident that many of the native gardens will shut up, and that ere very long. The Sinhalese or Tamil proprietor likes well enough to follow the European where coin can be made; but when the game is partly a losing one, and the expected return is postponed, the native soon wearies when his banquet is only the pleasures of hope. And yet, has it not often been the most enjoyable of times, and what a lot of it there is even in these present dark days in Ceylon? Without bright-eyed hope it would be a poor world!

"BAD TEA."

Tea importers over in Victoria are complaining that the local Customs Department is too particular about the quality of tea shipped into the colony, and that the officers of the department have exceeded reasonable limits in their rejection of shipments of the leaf. According to a Melbourne paper, the importers allege that the Victorian Customs Department has often condemned as "bad" shipments of tea which have obtained subsequently a ready passage through the Customhouse of Great Britain, and which have been there at more satisfactory rates than could have been obtained at Melbourne. To demonstrate that they were right they sent recently a condemned shipment of tea to London, and had not the slightest difficulty in placing it upon the market there. The importers contend that the Custom-

house officers have been in the habit of condemning as "bad" tea that was not in any way "bad," but was merely a low-grade quality, and the importers say that this was a wrong condemnation, inasmuch as it meant the shutting out of very cheap, but, at the same time, not unwholesome tea. In the circumstances, the opinions of the secretary of the Customs and of the solicitor to the Board of Trade have been obtained, and these have decreed that the Victorian Customs authorities have been somewhat too rigidly interpreting an act which follows precisely the wording of the English act. The correct practice, they say, appears to be to reject all tea in which exhausted leaf or foreign substances are mixed, or in which leaf of bad quality is present in such proportion as would render undesirable its consumption.—*Madras Times*, March 15.

THE FERNS OF BRITISH WEST INDIES AND GUIANA.

I am delighted to see that my good old friend Mr. Jenman, is describing the Ferns of British West Indies and Guiana. There is no one living who knows them better, and whatever Mr. Jenman does, he always does well. The Bulletin you sent me only contains two genera—or what are popularly known as "Filmy Ferns." No less than 29 species of Hymenophyllums and 42 species of Trichomanes are here described, which shows what a wealth of these exquisitely beautiful Ferns there are in the Western British Colonies (so far as I can make out we have only 9 species of Hymenophyllums and 16 or 17 of Trichomanes in Ceylon). The introductory paragraphs to the tribes, and the key to the genera are, to my mind, as plain as they can possibly be, and the descriptions of the species are so well arranged that any one who only knows a little of botany, can easily understand them. The explanatory note following each species as to localities &c. are to the point, and altogether this work promises to be of very great value both to professional cryptogamists and amateurs.—*Cor.*

QUININE, TRACTS, AND GINSENG.

The culture of Ginseng, the celebrated "febrifuge" and aphrodisiac of the Chinese, has been of old one of the principal industries of Corea. Ginseng is not used in Western pharmacy, and its culture has been so often described that we do not propose to revert to it here. But it is of some interest to hear, as we are told by H. M. Consul at Soul, in Corea, that quinine has lately been introduced into that country in considerable quantities, and is gradually superseding Ginseng among the Corcaans. The introducers of quinine into Corea are the missionaries, who, with a fine sense of practical Christianity, have hit upon the device of selling it at cost price in lieu of wages to their native distributors of tracts. The tract-disseminator re-sells the quinine to the natives at a profit, which he pockets, and the missionaries get their literature distributed free. The arrangement seems to suit all parties.—*Chemist and Druggist*, Jan. 22.

"LADY BIRDS" FOR THE PLANTERS OF SOUTHERN INDIA.

SIR ARTHUR HAVELOCK'S Government has done the right thing by the coffee-planters of Coorg, &c., in reference to their request for help

about importing lady-bird beetles. We have received, today, copies of two official General Orders on the subject. In the first, dated 11th December, the decision reads:—"The Government is unable to render the planters any substantial help in obtaining the services of a competent Entomologist or an Agricultural Chemist, but that arrangements will be made with the Government of Queensland for the shipment of a consignment of lady-birds." But in a later order, Jan. 17th, we find:—

In modification of the decision expressed in paragraph 2 of the first of the orders read above, His Excellency the Governor in Council resolves to approve of the proposal made by the United Planters' Association to send Mr. Newport to Australia to collect and bring over to this country a consignment of lady birds and is prepared to meet a moiety of the cost calculated on the basis of a maximum expenditure of R4,000 under the following items:—(1) Passage to Australia and back; (2) return Sydney to Brisbane; (3) expenses in Australia, say for two mouths; (4) travelling expenses in Australia; (5) expenses for collecting the lady birds, packing, &c., and freight; and (6) sundries. In other words, the Government is willing to make a maximum contribution of R2,000 in respect of the expense under those items. Mr. Newport will be furnished with a letter of introduction to the Colonial Secretary to the Government of Queensland. The Accountant-General is requested to place an advance of R1,000 at Mr. Newport's disposal. Sir Arthur Havelock deserves credit for so handsomely modifying the original decision.

PLANTING NOTES.

"COLONIAL": THE COLONIAL COLLEGE MAGAZINE.—Winter Session, December, 1897. Contents as follows:—Old Students' Column:—Communications from Africa, United States, South America, Italy, and Canada; Soils from Argentina; The British South African Police; Colonial Progress; Agriculture as a Career; The Suffolk Horse; Estate, Farm and Building Notes Weather Report—October to December, 1897; Weather Report for 1897; The Athletic Club Report; The Entertainment Society; Responsibilities of Young Englishmen; Our Frontispiece; Opening in the Colonies, &c.; College Notes; Notice to Correspondents; Old Students' Directory (revised).

TRIFACIAL ORANGE.—M. Delevalerie, in his account of the *Parc Public de l'Eschekieh, Cairo* (Ghent) p. 11, already noticed in these columns, gives the following particulars regarding the trifacial Orange: "Citrus Bigaradia, has long, pointed, often woolly leaves; the petiole is in some cases winged, in others not so. The flowers are white, but tinged with violet outside. When this tree was raised at Florence it was proposed to graft it, but the stock having grown out beneath the graft, it was noticed that the tree bore two sorts of leaves. It was therefore left to fruit. It was at first supposed that two branches, one of the Citron, the other from the Orange, had been grafted simultaneously, and had become united, but, as has been said, the tree produced shoots beneath the graft. Whatever the reason, the foliage shows this peculiarity, that the branches were intermixed. At Paris, at Huward's, there was formerly a specimen sixty years old bearing fruits partly Citron, and partly Orange. At Cairo, in the garden of V. R. de Choubeah, formerly the residence of Mehemet Ali, was one of these eccentric Orange trees from which we have gathered fruits of a three-fold form and nature, one third of each being Orange, one third Citron, and one third rough-skinned Citron."—*Gardeners' Chronicle*.

THE VALUE OF ESTATE PROPERTY IN HUNAGIRIYA DISTRICT, — may be judged from the fact that 190 acres of tea and 154 of waste and reserve on Weygalla realized £6,500—a good bargain, we should say, for the purchaser Mr. Beilby. The half of Hunagalla is equal to 215 acres tea and 114 reserve or waste and realized £7,250.—We have not heard the price paid for Ormondale in Allagalla; but it is sure to be handsome for such young tea on virgin soil.

DUST TEA WANTED FOR SOUTH AMERICA.—We have to thank Mr. Thos. Christy, F. L. S. d of Line Street, for the very welcome news to Ceylon planters, of a special demand setting in for Eastern teas (even if for China as well as Ceylon) on behalf of the consumers of the Paraguayan Maté tea in South America. It would seem from what Mr. Christy says that Maté may be altogether superseded and he thinks that Ceylon and Indian "dust" tea is just the article required in substitution. Altogether there are forty to fifty million of people in South America, and perhaps one-half may be taken to be patronizers of maté; while nearly all may be tempted to become patrons of our teas if they put attractively before them.

THE COPPERAH MARKET: A RISE IN PRICES.—The market for copperah has gone up rapidly during the last four days, and dealers are bringing into Colombo anything and everything they can get to take advantage of the rise. "Cart" copperah as a rule fetches much less than "boat" copperah, and, owing to this, the former is being thrown into boats, and the arrivals of carts are almost *nil*. Well dried estate and Calpentyn, which fetched R39.50 per candy a few weeks ago, is now selling at R42, and Marawilla, Madampe and other inferior grades, mixed with black and tender refuse, are fetching R40 and R41 per candy. It is to be regretted that prices are being run up, considering the low state of the oil market, and in view of the forthcoming crops which are said to be heavy.—*Cor.* of local "Times."

CEYLON *v.* INDIAN AND JAVA TEAS.—A very careful and experienced Ceylon tea planter and maker, discussing the letter of the Lane expert to Mr. Wm. Mackenzie, says that in appearance, Ceylon upcountry teas as a rule can never equal Indian or Java teas on account of the more flexible leaf of the latter as compared with the generally stiffer or leathery high grown Ceylon leaf. It is also only natural, that teas from the rich heavy soils of Assam and Java should have a fuller "body" than much of the Ceylon tea; but in the actual work of "rolling," which the expert thought was deficient in the case of Ceylon teas, as a matter of fact our teas are often rolled for a much longer time than those of Assam. It is not therefore, a case of the Ceylon planter refusing to profit by outside experience; but the requirements mentioned are just what cannot be provided as a rule in the case of Ceylon teas, although in other respects they score over the teas of both India and Java.

TEA IN RUSSIA.—Here is how the London Tea Letter of *The Planter* deals with this question very sensibly:—

The total consumption in Russia is, I am told, about 120,000,000 lb., of which in the year just ended perhaps four per cent came from Ceylon. Of Indian teas, to use the language of analytical chemists, there was little more than "a trace." So that here as in the United States there is, even among present consumers, a big field open for missionary enterprise. Outside that field the possibilities of the future are practically unlimited. But in one respect the pro-

blem in Russia differs essentially from that in America. In the United States the tea drinkers are at present coffee drinkers almost to a man, the consumption of coffee running as high as 10 lb. per head of population, and the battle of tea has, in fact to be waged against the fragrant berry already holding the field. The very low price at present ruling for coffee is, of course, an adverse element in the struggle. In Russia, on the contrary, tea is already the favourite beverage, and the consumption is limited, not by the existing taste for any competing rival, but solely by the absurdly conservative, obstructive, ways of the Russians themselves. Government and traders both seem to combine to crush any tendency towards expansion of demand by high duties and big profits, the object being to confine the trade as far as possible to the few firms who at present hold it in their hands. A duty of 1.10½d per lb. on entering the country, obstructive regulations as the packing of teas for sale retail, result in prices for even teas of the poorest class that except to the well-to-do, are prohibitive. The enemy then to be fought in Russia is the system. The taste for tea is already established, let the duties be reduced, and distribution be made free of trammels, and the result would be seen not only in an enormously increased consumption, but also in a revenue advancing by leaps and bounds such as in days past used here to delight Mr. Gladstone.

Who will enlighten the Russian Finance Minister?

"THE TEA PLANTERS' MEMORIAL."—Such is the nominal heading we find in the Mauritius Planters' *Gazette* of 1st March. The striking fact is that there should be more than one or two tea planters already in the Sugar Island. They are petitioning for a rise in the import duty on tea and no wonder, for we read.—

At the present time the duty on imported teas is R0.10 per kilo. So far as we have been able to ascertain this is the *lowest* duty paid in any country, be it a British or Foreign possession. It is scarcely necessary to give a tabulated statement of the duties exacted in various countries: sufficient to say, that that range from 0.10 per kilo [or 4½ cts per lb.—Ed. C.O.]—in Mauritius to about R1.12 per lb in India. [This is absurd: the Indian duty is 5 per cent on a value of 50 cts per lb for black tea and 75 cts for green tea—therefore only 2½ cts per lb for ordinary tea l.—Ed. C.O.] In Ceylon duty on imported teas is R0.25 per lb. Those who drink tea in Mauritius have to pay from 80 to 90 cents per lb. for what they buy. The average price for teas disposed of at the weekly sales in the Colombo market, is about R0.36 per lb. Even assuming that the tea imported into Mauritius costs this figure—but we do not think it does—after adding freight, landing charges, duty etc., it stands the imported in, at the very outside, R0.50 per lb. There is therefore a profit of between 30 and 40 cets per lb or nearly 80 % on the cost price, to be divided between the importer and the retailer. It does not require very great intelligence to see that, at the present time, the cost of production and preparation to the Mauritius Tea Planter must be infinitely more than to his brother in Ceylon. The bushes are not, in the majority of cases, yet in full bearing, and the equipment of tea houses is, in most instances, crude and imperfect. The cost, therefore, of marketable teas being greater, every assistance should be given the Mauritius planter to enable him to enter the local market on terms of equality with his more advanced competitor. Our impression is that a good drinkable tea can be offered to the public both by local Growers and Importers for R0.80 the pound, and if the Government would impose the same duty on imported tea as is done in Ceylon, viz: 25 cts per lb Mauritius and Foreign teas would compete in the local market on even terms.

This is one result of leaving the absurd import duty of 25 cents per lb in tea in Ceylon; Mauritius planters say rightly why should we not have the same duty—and so shut out Ceylon teas from Port Louis market.

THE FALL IN PRICE OF COCONUTS.

In considering the disastrous effects on our industries of the rise in Exchange, and of the falling-off in income which is involved in the disturbance in trade which has followed, one is apt to think only of Tea. And, perhaps, that is only natural, considering that it stands first among our staple exports, both in value and in the importance as well as suddenness of its development; but in discussing "the situation" we must not lose sight of the effect of the "dishonest" rupee on our other exports. The extent and gravity of this effect have been brought home to us by a reconsideration of the Report of the Horrekelly Estate Company Directors, which was adopted at a meeting of shareholders held on Monday last at Colombo. The proceedings at the meeting have been already published and we briefly referred to them at the time, congratulating the shareholders (in these "hard times") on their five per cent dividend. But a friend who has sent us a copy of the Directors' Report for the previous year—when ten per cent was earned—has enlightened us and shown that there is room for criticism, or at any rate for seeing how the inflated rupee and high exchange may affect other produce than tea. We are not wrong, we believe, in taking the case of Horrekelly as a typical one. Of course, there are Coconut estates in Ceylon better than that on which the resolute and enterprising veteran, David Wilson, spent so much of his capital and energy, just as there are many worse. Maravilla, however, is counted among the best of our Coconut districts, and Horrekelly is well situated with respect to the sea in that division, while there are those who believe that this most useful palm flourishes best on and near the Coast, where it receives a liberal allowance of salt from the soil as well as from the salt-laden winds; it has exceptional facilities of transport in the canal which runs through it, and in the old and new roads which almost form its boundaries; and it has been liberally cultivated, perhaps from the beginning, but certainly since it passed into the hands of the Company say about twenty years ago, if not more. Yet what do we find? The dividend declared for last year (which we thought satisfactory before we were reminded of the rate for the previous year) is only just one-half of that for 1896! It would be a mistake to refer the whole of this difference to the course of exchange; for there are other circumstances, to which we shall presently advert; but there can be no doubt that the fictitious value of the rupee has told on the operations of those who deal in coconut products—whether oil, desiccated kernel, copra, or coir—and resulted in lower prices for nuts.

Among the other causes, which told on the income of the Company last year, was undoubtedly a shorter crop. Thus, we find, in the comparative statement embodied in the Report that whereas the estate yielded 1,548, 81 nuts in 1896, last year the yield was only 1,400,835. Here is a shortage of nearly 148,000 nuts—due, we suppose, to a less favourable season and not to any falling-off in cultivation; for the crop for 1895 is returned as 1,332,965 and for 1894 (in the Report for that year which we have just looked up) as 1,02,237. The heavy rainfall, of the latter half of 1895 and of 1896 as a whole, had evidently benefited the property, and hence what looks like

the exceptionally large crop of over a million and a half of nuts. Well, a difference of nearly 150,000 nuts in the crop statement, must tell on the income; but it is not there that the chief trouble was found, so far as we can see. Working out the average from the total income from nuts and copra and the number of nuts picked, we make out that 1896 showed R49 per 1,000 nuts, whereas last year gave only R31 per 1,000. Here we have a difference of R6 per thousand, or nearly 15 per cent—a fall that may be compared with that in tea shares for the period—and that works out into a big sum on a million and a half of nuts. We find too that the experience of most coconut proprietors is similar; for inquiries have made us acquainted with differences of from R4 to 6, and even more, in the average prices of the six crops generally calculated for the year. We look upon the average which Horrekelly obtained for 1896 as uncommonly good, and fancy it must have made an advantageous contract before prices began to recede. But not only had the Company to contend with a shorter crop and much lower prices; but its expenditure was larger! The explanation given at the meeting to an inquiring shareholder was that the crop of 1896 was sold on the spot in nuts purchased for Colombo Desiccating Mills; whereas the crop of 1897, in the absence of an advantageous offer for nuts, had to be converted into copra; and the cost of manufacture, of course, swelled the expenditure. Still, economy seems to have been practised; for we find the expenditure was lower in 1897 than in 1895—in which year the crop of nuts was smaller and the outturn of coir fibre was less. The Company, so far as we can judge, seems to us to be in a sound position and to be carefully administered; but it has suffered from exchange like most of our Island industries; and, we fear, unless the demand for coconut oil should advance, there is small chance of the price of nuts which ruled two and three years ago being ever again realised, with so much land coming into bearing. Horrekelly has, however, this advantage—that it will soon have two Desiccating Mills at its doors—which should help to raise the price of nuts locally.

 PLANTERS AND PLANTING IN THE MALAY PENINSULA.

A recent mail brought us some interesting papers from the Straits in the Annual Report and Proceedings at a General Meeting of the United Planters' Association of the Federated Malay States and separately of the Selangor Planters' Association. But the funny thing is that we find so many of the same planters taking part in both Associations—Messrs. F. H. Hill and E. V. Carey being most prominent in both—while Mr. Tom Gibson is Secretary for the two bodies. We fancied 'Selangor' might be as a District, subsidiary to the "United"; but if so it is far better off financially, closing the year with a credit of 790 dollars; while the United Association has a debit balance of 344 dollars. Moreover we think Mr. Carey's remarks at the Selangor meeting are about the most interesting:—

There was no denying the fact that the last year had been a disastrous one for them all. The local market price of coffee was at the commencement of the year \$31, and at the close of the year it had fallen to \$19. The position was both serious and critical, but he

still saw no reason why they should not weather the storm. Ceylon, with a comparatively worn-out soil, had passed through a worse crisis, and now, thanks to a flourishing tea industry, was one of the most prosperous of our Colonies. In Selangor they had virgin soil and coffee was not the only product which would grow there. He would particularly draw their attention to Mr. Derry's report on the Kuala Kangsar rubber trees, which deserved their careful attention. The report was being printed and would be sent to all members shortly. The Klang land was much the same as at Kuala Kangsar, where such excellent results had been obtained, and, in his opinion, there was a tremendous lot of money in Para rubber. Coconuts also could be seen in the Klang district growing in perfect harmony with the coffee, which looked exceedingly healthy and was bearing heavily. There was one very important point which he thought had received insufficient attention, and that was the curing of their coffee. When Mr. Stephens, at a meeting of the United Planters' Association, suggested that expert opinion should be obtained from Java, many of us thought such not necessary and that we had nothing to learn, but there was no getting away from the fact that in Java the planters had got the market in their favour, whereas our coffee was not eagerly sought after. The more he studied this question the more convinced he became that we had nearly everything yet to learn on this important subject, and he could not too strongly urge upon all of them the necessity of experimenting, as was being done by a planter at Kajang, who had already made some most valuable experiments.

From the Selangor Report we learn.—

The actual increase of land under coffee should be 2,451 acres, as 600 acres of land under tapioca, included in the 1895 statistics, have gone out of cultivation this year. These returns cannot be regarded as other than satisfactory in view of the fact that whereas in December, 1896, the market quotation for No. 1 Liberian Coffee was \$31 the price has now fallen to \$19. That this latter figure shows quite an abnormal condition of things, your Committee feel convinced, and that, with improved curing, a reaction will set in appears merely a matter of time, for the Straits Settlements can always more than hold its own with regard to cost of production as compared with Rio and Santos, whose huge crops have contributed so largely to the present depressed condition of the coffee market. At the same time, it is evident that coffee planters must turn their attention to the cultivation of other products as well, and your Committee are glad to be able to report that a large number of the valuable Para rubber trees have been planted and that coconuts and ramie, the latter at present on a small scale by way of experiment, have both received their share of attention.

RAMIE.—The importance of the ramie industry was brought to the notice of Government and assistance was asked to provide for an expert to visit Selangor and report on the suitability of the various districts for the cultivation of this product. The reply of the local Government was unfavourable; but, in view of the fact that both the Indian and Dutch Governments have offered considerable pecuniary assistance in connection with the ramie industry, and the cultivation being one which may greatly add to the prosperity of the Federated Malay States, your Committee addressed the United Planters' Association on the subject asking that body to bring the matter to the notice of the Resident-General. We regret to say that the Resident-General regarded this question in the light of class legislation and on this score could hold out no hopes of Government assistance.

A memorandum from Mr. Wray, Curator and State Geologist of Perak, was however, published for the information of planters, and was altogether unfavourable to the prospects of ramie cultivation in this country; but the opinions of the different authorities who have studied this subject or so entirely contradictory that your Committee cannot regard the fiat of Mr. Wray as in any way conclusive, nor do they see how the application of a State grant towards the cluci-

ation of a question of such importance to Europeans and natives alike can be fairly described as legislation for a class.

As regards the prospects of Coffee crops we have these figures:—

Statistics collected from those in favour of a general curing establishment, with the object of approaching well-known curing companies in Ceylon and other countries and inviting them to erect a large store in a suitable locality in Selangor.

1.	Acreeage under cultivation in 1893 ..	11,992½ acres
2.	Estimated crop in piculs, for 1898 ..	12,633 piculs
3.	" " " " " " " " " " " "	21,179 "
4.	" " " " " " " " " " " "	38,093 "
5.	" " " " " " " " " " " "	53,290 "
6.	" " " " " " " " " " " "	64,533 "

(A picul is 133½ lb. English.—E.D.)

Turning now, to the United Planters' gathering, it is interesting to note so many names known in Ceylon:—

Mr. T. H. Hill (*Chairman*), Messrs. E. V. Carey, L. Dougal, C. Meikle, J. R. Watson, M. Cumming, H. d'E. Darby (Members of Committee), M. Stonor, A. B. Lake, J. C. Pasqual, R. Muuro, A. J. Thackwell, S. W. Moorhouse, H. M. Darby, F. Callaway, Logan Tod, Hughes, C. G. Glassford, R. C. Kindersley, S. M. Parry, J. D. Toynebe, F. B. Hicks, Brooke, Shepherd, Tom Gibson, (*Secretary*). By proxy: W. Coates, J. McClymont, J. B. Douglas, Horace Brett, Q. McClymont and H. Tunncliffe. Visitor, Mr. Chubb.

Experimental Gardens form a subject of discussion and the Planters' Committee formulated a scheme:

(a) That a Committee or Committees be formed composed of two Government nominees and two or more resident planters in the State or States where the gardens are situated;

(b) That the Government allow a block or blocks of land high and low to be selected by such Committee or Committees for the purpose of cultivating economical plants;

(c) That the Government provide a vote of \$15,000 for the first year, which will be disbursed as the Committee think most advantageous, in salary of manager, wages, of labourers, purchase of plants and other necessary items of expenditure;

(d) That the Committee furnish estimates for the first twelve months working;

(e) That applicants have the right to plants in such rotation as the Committee may appoint, always provided that one applicant shall not have a prior right to a second allotment of plants until all demands have been met in turn;

(f) That members of Committee shall, in rotation, undertake to inspect the books to be kept and to report on the works and areas for a fixed period of a year, and to see that the gardens are managed upon a commercial basis.

The Resident-General by his Secretary very wisely asked in reply:—

(a) Seeing that the States are about to be connected by railway, would it not be preferable to establish one central garden, and if so, which of the States would be most convenient for the purpose?

(b) Can those of the old Ceylon planters who are on the Committee explain the system on which the Ceylon garden is conducted.

To this no answer is recorded so far.

From Mr. Hill's address as Chairman we quote,—

COFFEE.—Now, gentlemen, the next matter that I will call your attention to is the position of the coffee enterprise at present. As far as can be judged an estate of 300 to 400 acres in full bearing and highly cultivated can be looked upon to produce a crop of 5½ to 6 piculs per acre at a cost from \$90 to \$95 per acre, with the coffee delivered in Singapore, and this represents roughly 3½d. to 3½d. per lb. in London. Now the question appears to me to be, is there any country where coffee can be produced at a lower rate of the

same quality? If not, our future, although dull looking enough at the present, must brighten considerably. It should be one of the first duties of the Association's new year to ascertain as far as possible the actual cost of production in other places. This much I can tell you, that in the prospectus of the Dunmott Coffee Company, which is the largest enterprise in the world of its kind, the cost of bringing an acre into bearing is given at £10 and the time that it takes before being reproductive is given at five years. You will at once see for yourselves that here we can compete with great advantage to ourselves as regards cost, and that being so our capital account will not be so heavy and we require to pay less interest to pay our way. It may interest you further to know that on an already opened labour established estate, in 37 months from the date of the plants being put out, 45 months from seed, piculs, 2 65 per acre have been gathered. These figures are given you as being of general interest and show that whilst the present depression should not be unduly magnified in its ultimate result, yet it may be the means of inducing an economical system of working, without which any enterprise is bound to suffer in the long run.

CURING.—My own opinion is that large estates will find it more economical to do their own curing, but should the tontino system be adopted with a division of profits after interest has been paid on capital invested, pro rata on the parchment supplied to the mill, the scheme might meet with general support. At the same time, it should not be overlooked how attractive store work is to the Tamil labourer as affording work to the wives of the labourers that may have families of children, for whom—I speak from experience—it is otherwise difficult to provide work.

The actual saving in cost of curing parchment on the estate and curing the coffee fit for the market as far as ascertained, is 30 cents, against which you lose the dust and increased cost of transport has to be added. We now, gentlemen, come to the all-important question of the means taken to raise the price of the coffee. I am not of opinion that, considering the state of the coffee markets, our coffee has been unduly depressed—it is a small article of trade and therefore there has hitherto been small competition for dealing in it. While Rio and Santos coffee was sold at 23s 6d our coffee was not lower than 32s to 33s at the same time. My personal opinion remains unchanged, that we should endeavour to get to the consumer and the grocer direct.

COCONUTS have occupied a good deal of attention during the year and large areas have been taken up for this cultivation. It can only be a matter of congratulation to those who have seen the devastation committed in the Klang district by the beetle that the Enactment which has been under consideration has been passed in Selangor, and with the aid of those interested in coconut planting there should be little difficulty in keeping this pest in check if not in exterminating it. This is plainly shown by a coconut estate (Siglap) in Singapore, which is practically free of beetle whilst its neighbours are in sorry plight.

PARA RUBBER.—After a few words on rubber cultivation, prominently brought to notice lately, I will not detain you longer. "On one estate 38 lb. of rubber collected from 7 trees has been the year's crop. The best tree gave 7½ lb. The trees were of various ages from 10 to 12 years. The largest yield was from a tree grown at least 16 feet above water level on an alluvial soil highly coloured with peroxide of iron. My impression is that if there is anything in favour of planting rubber on low-lying dump land it remains to be ascertained. The cost of collection may be taken not to exceed 10 cents per lb. Rubber actually free from dust and bark was sold for 3s. per lb. and the remainder fetched very neatly that price, as it contained a little dust and bark, which it is very difficult to keep it free from.

From all which we can see that Straits planters are having a turn of hard times like their neighbours.

ROYAL GARDENS, KEW, AND WEST INDIES.

WE are indebted to the Director for a special copy of a bulletin containing:—

Report on the Economic Resources of the West Indies, by D. Morris, C.M.G., M.A., D.Sc., F.L.S., Assistant Director, Royal Gardens, Kew.

It is introduced by a Preface from Mr. Thistleton Dyer, F.R.S., and there is a very good map of the West Indies. Each Colony is dealt with by Dr. Morris in a very interesting and practical way and we shall have occasion to refer to the Report very often and to make extracts in reviewing the state of each Colony

TEA TRADE IN RUSSIA.

The following correspondence has been forwarded to us from the Colonial Secretariat:—

Downing Street, January 21.

Sir,—I have the honour to transmit to you copy of a memorandum by Mr. T. N. Christie, formerly a member of the Legislative Council of Ceylon, with regard to the conditions of the Tea Trade in Russia. A copy of this memorandum has been referred to the Foreign Office with a request that full enquiries may be made into the matter to which Mr. Christie refers and which appears to be one of much importance.—I have, &c.,
(Signed) J. CHAMBERLAIN.

To Governor, The Right Hon. Sir J. West Ridgeway, K.C.B., K.C.S.I., &c., &c., &c.

St. George's Club, Hanover Square, Jan. 13.

Sir,—I have recently returned from Russia, having concluded certain enquiries on behalf of Ceylon in connection with the Tea Trade there.

It is probable that as one result of my mission you will be approached from Ceylon with the view of trying to obtain the Russian Government's consent to a reduction in the very excessive import duty, 1/10½ per lb., now levied on tea entering that country, and good reasons will, I have no doubt, be given in support of such a request.

During my enquiries I ascertained certain facts which are of much importance, not only to Ceylon's trade, but to that of the Empire generally, with Russia and it might, I suggest, be well to have my statements verified forthwith, so that in the event of the representations I anticipate being made from Ceylon, there will be less delay in dealing with them.

I was surprised to find that tea entering Russia by the European Frontiers was charged a different and much greater duty than that entering by the Chinese frontier, and thus in practice a differential duty has been established regardless of the most favoured nation clause of our treaty (see extract). It might be argued that if Ceylon or Indian teas were sent to Russia through the Irkutsk Custom house, they, too, would be entitled to the lower rate, but I submit that access through that door into Russia being exclusively in the possession of one country (and that unfortunately our great tea-growing rival) the differential duty is contrary to the treaty.

While pursuing my enquiries in Moscow, it came to my knowledge that differential rates of railway freight exist between that City and Odessa. Tea arriving at the latter town in Russian ships is charged 92 kopecks per pood, while that arriving in British ships is charged

one rouble twenty kopecks per pood. This I may mention is, by the accident that the steamers of the Volunteer fleet call at Colombo, not adverse to Ceylon (and indeed favours that Colony to the disadvantage of India) but it is none the less a clear breach of sections IV and V of the treaty (see extract). At one time a great proportion of the China tea consumed in Russia passed through London, and this differential transit rate has been a factor in killing that trade. I believe the differential rate effects other goods and probably other routes, but I could not obtain positive information on that point. I informed the Consul General at Odessa, that differential rates were in existence (of which he had not previously been aware) and he at once tried to get an official statement of the tariff, but up to my advices of a few days ago he had, on one pretext or another been put off. I believe efforts are being made at Saint Petersburg to obtain the information.

I was informed in Odessa, that the trade in rice between India and Russia had been killed when the latter country concluded a treaty with Persia, under which all the goods of that country are admitted at a 5 per cent *ad valorem* duty—much less than is charged to other countries.—It is difficult to understand how such a Treaty should have been passed apparently without any protest on our side.

I have little doubt that had my enquiries been in connection with our trade generally, I would have come across other instances of unfair treatment in breach of engagements supposed to be binding.

The importance of all this becomes manifest in connection with the completion of the Siberian Railway, and in my conversations with the Moscow tea merchants (who are very influential), it was evident that some of them have already considered that question and look for a change in trade conditions when the line is opened.

If the Russian Government maintains that differential import duty and introduces railway rates on the Odessa-Moscow principle, the trade in Ceylon and Indian teas, now about five million lb. per annum, will be killed, and there will, in various directions, be most serious further diversions of goods from British Channels if the existing treaty clauses are ignored.

I understand that Russian merchants are representing to their Government how British trade has benefited at the expense of Russian by the Kara sea free ports, and the question of discontinuance of such free ports and the policy to be pursued in connection with the Siberian railway must now or very shortly be under consideration, and it would seem to me opportune and of great importance that when such tariff arrangements are being discussed, Her Majesty's Representative in St. Petersburg should have his attention directed to the circumstances which have given rise to this letter.

A reduction of the European tea duty to the same level as the Siberian should be aimed at, but failing that the increase of the latter to the same rate as the former would greatly benefit British interests.

I annex extracts from the Treaty of 1859 and a translation of that portion of the Russian Customs tariff relating to tea.—I am, &c.,

(Signed) THOMAS NORTH CHRISTIE.

The Right Hon. the Secretary of State for the Colonies.

TREATY OF COMMERCE AND NAVIGATION

BETWEEN HER MAJESTY AND THE EMPEROR OF ALL THE RUSSIAS, OF 1859.

ARTICLE II.—No other or higher duties shall be imposed on the importation into the dominions and possessions of Her Britannic Majesty, of any articles, the growth, produce, or manufacture of the dominions and possessions of His Majesty the Emperor of all the Russias, from whatever place arriving, and no other or higher duties shall be imposed on the importation into the dominions and possessions of His Majesty the Emperor of all the Russias, of any article of the growth, produce, or manufacture of Her Britannic Majesty's dominions and possessions, from whatever place arriving, than are or shall be payable on the like article, the growth, produce, or manufacture of any other foreign country; nor shall any prohibition be imposed on the importation of any article the growth, produce, or manufacture of the dominions and possessions of either of the two contracting parties into the dominions and possessions of the other, which shall not equally extend to the importation of the like articles being the growth, produce, or manufacture of any other country.

ARTICLE IV.—The same reciprocal equality of treatment shall take effect in regard to warehousing, and to the transit trade, and also in regard to bounties, facilities and drawbacks, which are or may be hereafter granted by the legislation of either country.

ARTICLE V.—All merchandise and articles of commerce, the produce or manufacture either of the dominions and possessions of His Majesty the Emperor of all the Russias, or of any other country, which are or may be legally importable into the ports of the United Kingdom of Great Britain and Ireland, its dominions and possessions in British vessels, may likewise be imported into those ports in Russian vessels, without being liable to any other or higher duties, of whatever denomination, than if such merchandise and articles were imported in British vessels: and reciprocally, all merchandise and articles of commerce, the produce of manufacture either of the United Kingdom of Great Britain and Ireland, its dominions and possessions, or of any other country, which are or may be legally importable into the ports of the dominions and possessions of His Majesty the Emperor of all the Russias, in Russian vessels, may likewise be imported into those ports in British vessels, without being liable to any other or higher duties, of whatever denomination, than if such merchandise and articles were imported in Russian vessels. Such equality of treatment shall take effect without distinction, whether such merchandise and articles come directly from the place of origin, or from any other place. In the manner, there shall be perfect equality of treatment in regard to exportation, so that the same export duties shall be paid, and the same bounties and drawbacks allowed, in the dominions and possessions of either of the high contracting parties on the exportation of any article which is or may be legally exportable therefrom, without distinction, whether such exportation shall take place in Russian or in British vessels, and whatever may be the place of destination, whether a Port of the other Contracting Party, or of any third Power.

ANNEXURE.

Translation of section 20 of the Russian Customs Tariff official edition of the Department of Customs of the Imperial Ministry of Finances, printed in 1894. Tea of all kinds imported at the European Customs Houses pay duty Roubles 21-gold per Pood (of 36 lb. English).

OBSERVATION.—Tea of all kinds imported through the Irkutsk Custom House and at the South of it over the Siberian and Steppe Region frontiers pay a duty*:—(a) On Baikhoff Black, flower, green and

* L (era) translation from the Chinese—"little white hairs." It was the name originally given to flowery teas with perfectly white tips—later on all teas passing through Kiachta got the name of Baikhoff.

yellow tea. 13 Roubles gold per Pound: (b) On brick teas Roubles 2.50c gold per Pound: (c) On teas in Slabs accompanied by Consuls certificates as to their being prepared in Russia and with the names of Russian fabricants on each slab 10 Roubles, gold per Pound.

RATES OF DUTY ON TEAS.

European frontiers Roubles 21 gold, per Pound or £10 10s 8d per cwt.=1s 10½d per lb. English.
Siberian Roubles 13 gold, per Pound or 46 3s 4d per cwt.=1s 2d per lb. English.

KOLA IN THE FRENCH SOUDAN.

Great quantities of kola-nuts are imported into the French Soudan. In French territory it is only found at Kisi, and as it is the most common article of exchange in the country, it is brought thither from other parts. The value of this import in 1886 was 1,350,000f., or about 21,500,000 nuts, the price varying from 25f. to 15f. the hundred nuts, according to the origin, and also according to their size and colour, the pink nuts being more highly esteemed than the yellowish-white ones. The kola nut is much appreciated for its medicinal property as a tonic, but it is also in great request in certain native ceremonies, such as betrothals, marriages, &c.—*Chemist and Druggist*, Feb. 26.

VANILLA.

At the meeting of the New York College of Pharmacy held on January 18 five papers were read on vanilla. Professor Rusby treated of the cultivation, &c., of vanilla. He said that there are thirty-three species of vanilla now recognised. The process of curing vanill-pods and preparing them for packing was described as he had seen it done in South America. Vanilla-packers, he mentioned, are subjected to poisoning, resulting from handling the beans, the symptoms being much like those resulting from poisonivy, due, he thought, to penetration of the skin of the hand by oxalate-of-calcium crystals. Dr. S. E. Jelliffe treated of the microscopy of the subject, and said unscrupulous dealers often used benzoic acid to make a false appearance of vanillin on the beans. The microscope revealed the fraud readily, benzoic-acid crystals being flattened and rhomboidal, vanillin acicular and standing out at right angles from the surface of the fruit. Professor V. Coblenz treated of the chemistry of vanillin, and said it was frequently adulterated with acetanilid. Mr. A. Henning's paper was on the commercial varieties of vanilla. He said that that from the Seychelles Islands, an inferior kind, was the sort chiefly used in England. The Mexican vanilla grown at Papantla had the most exquisite odour, and was the kind used in the United States. The pharmacy of vanilla was considered by Mr. O. Kalish, who recommended an extract made from a formula containing 8 oz. of vanilla in a gallon of finished product. He said that vanillin could never displace vanilla as a flavouring-extract, as it lacks the delicate flavour of the natural bean.—*Chemist and Druggist*, Feb. 26.

TEA IN AMERICA.

New York, Feb. 16.

Quotations on invoices unchanged. The tone of the market continues firm on greens. Low-grade Japan and other sorts steady.

Recently a trip through New York State demonstrated that the conspicuous sign in the grocers' windows is of some sort of Ceylon or India tea. They are growing in favor, and it looks as if the prophecy of an old veteran in the trade would soon come true, viz.: "Ceylon and Indian tea are to be the tea of the future."

Below will be found additional and amendatory regulations in regard to the importation and inspec-

tion of tea under the act approved March 2, 1897. This circular has been sent out by Lyman J. Gage, Secretary of the Treasury, under date of February 7, to collectors and other officers of the customs. It is as follows:

"The following standards for imported teas are substituted for those prescribed by Circulars No 69, of April 21, 1897 (Synopsis 17,995), and No. 186, of November 6, 1897 (Synopsis 18,554):

"First.—No. 1, Formosa Oolong; No. 2, Foochow Oolong; No. 3, Amoy Oolong; No. 4, North China congou; No. 5, South China congou; No. 6, India tea; No. 7, Ceylon tea; No. 8, Pingsuey green tea; No. 9, (a), country green tea (Young Hyeon) No. 10 (b), country green tea, (Hyson); No. 11, Japan tea, pan-fired; No. 12, Japan tea, sun-dried; No. 13, Japan tea, basket-fired; No. 14, Japan tea, dust or fannings; No. 15, scented orange pekoc; No. 16, capers; No. 17, Canton Oolong; No. 18, scented Canton.

"Second.—In order to promote uniformity in the methods of examination of teas, they include the following rules, recommended by the Board of Tea Experts, are prescribed.

"Testing for dust.—The dust and fannings in all Formosa, Foochow, and Amoy Oologs, Canton teas, congons, Indias, and Ceylons must be restricted to 10 per cent when sifted through a sieve of No. 16 mesh made of brass wire. In order that the needle leaf and pekoc tips may not be confounded with dust, they must be returned with the dust to the sieve for a second and third sifting until separated.

"In the case of Ceylon and Indian teas, the needle leaf and pekoc tips shall be separated by passing them together with the dust through a No. 26 sieve of brass wire, after the tea has been first sifted through a No. 16 sieve.—*American Grocer*."

COFFEE AT LANDSBOROUGH, QUEENSLAND.

[It is interesting to Ceylon planters to see how "pioneering" with coffee is carried out in Queensland.—Ed. 7.1]

The success which has attended the cultivation of coffee the Budorim Mountain has at different times reduced selectors on the Blackall Range to start the industry in a small way, and these experiments have shown that the soil and climate in certain localities in the district are eminently suitable to the coffee plant. Two or three years ago a company was formed in Brisbane for the purpose of growing coffee on a large scale about twelve miles from Landsborough, on the North Coast line, and some 40,000 coffee plants were raised, and a few acres were planted out. The method adopted by the manager, Mr. Waldegrave Thompson, who had gained his experience in Ceylon, was to brush the scrub, burning off all undergrowth up to six inches in diameter, and leaving the large trees standing to serve as shade.

The experiment for various reasons proved a failure and when the plantation was purchased twelve months ago by W. Mr. Bartlett the whole of the plants had died off owing to the neglect.

Mr. Bartlett set to work energetically to reform the plantation and the nurseries. He found the nursery established on a flat beneath a ridge, subject to the washing-down of soil during heavy rains. He abandoned his spot, and located the seed beds and nurseries sixty feet higher up the bank, and close-paled it all round, surmounting the posts with a barbed-wire fence. He obtained some 500 plants of good varieties of coffee from the Department of Agriculture, and set them out in a nursery 80 feet long and 50 feet wide. He next planted out some 200 of the largest of these trees 9 feet apart, and they are now growing vigorously. Two thousand five hundred plants raised from seed have been planted in the nursery at a distance of 6 inches by 3 inches, and these will be ready to be transferred to the permanent plantation next season. In addition to these

there are 20,000 plants of Arabian and Liberan coffee, all looking healthy and vigorous. Some seeds of fine Mocha were obtained from the Agricultural Department about three months ago, and they have outstripped all the other seedlings so far. Mr. Bartlett finds that the local seed is so far before that received from Cairns. The latter seems to do better in the hotter Northern climate than in the comparatively cool climate of the South, whilst the former exhibits a far more vigorous growth. The best seed of all is that obtained through the Department from Mr. Grieve at Broadwater.

In clearing the land, all the timber except the native plum trees is burned off, the plum trees being left about 30 feet apart to afford the necessary shade. The standing scrub on the boundaries of the estate breaks the force of the winds. Belts of scrubs will be preserved at intervals of chains, and as a further protection rows of olive trees will be planted. Of these thirty are already planted out, and 100 truncheons are, with the exception of three or four, giving promise of healthy trees. Mr. Bartlett says the Blanchall Range is undoubtedly the home of the olive tree. Two rows of coffee plants will be planted between the olives this season. Coffee will also be planted between fruit trees on a 3-acre orchard which has been cleared some eight years ago. Frost is not to be feared here, the thermometer in winter ranging 15° F. higher than on the site of the original nursery. The land faces the south-east, with a gentle slope towards Ubi Ubi Creek, which is always running. In addition to the main crop of coffee and olives, there are plots of arrowroot, sugar, maize and lucerne, whilst in the orchard may be seen bananas, apples, oranges, loquats, pears and a large bed of splendid rhubarb. The Giant Tomato has also been planted. The cultivation is fenced in with 14-gauge 36 inch wire-netting with a barbed wire 9 inches above the netting to keep out the marsupials. The whole of this work has been accomplished in twelve months, and it is anticipated that three years will see the estate self-supporting.—*Queensland Agricultural Journal*.

A CIRCULAR FROM MEXICAN SHIPPERS OF VANILLA BEANS.

The principal Mexican shippers of vanilla beans have forwarded to their New York correspondents a circular letter contradicting certain published statements concerning the crop and the present position of stocks. Reports that the actual vanilla crop of Mexico will amount to about 75,000 pounds have been widely spread, while it can be safely stated that the output this year and for several years to come will not reach 35,000 pounds, including the vanilla cuts, due to the havoc wrought to the vanilla plants during the frost of 1895, which were not replanted owing to the long drought of the same year and of 1896 and part of 1897. It will take some time to replace them, and then three or four years must elapse before they begin to yield crop. It is well known that the Mexican vanilla has the most delicate flavour, and its worth in every market is double or three times greater than that of other vanillas. Manufacturers of extracts in the United States know well that the active principle of Mexican vanilla is not only the most delicate; but also that it yields a greater percentage of essential oil. These are the principal reasons for the difference in value. The rise in prices is due to the insignificance of the last crops and the coming ones, economical reasons that regulate the supply and demand. And to this we may attribute the fact that at present vanilla from the French colonies is also worth twice as much as it was before.—*Oil Paint and Drug Reporter*.

MINOR PRODUCTS.

London, Feb. 24.

COCA LEAVES.—There is still nothing doing in these leaves, and good *Travillo* kind remains nominally worth 8d.

OIL OF CITRONELLE.—This is again a little easier, business buying been done in 40 lb. tins this week at 1s. 2½. spot.

OIL OF LEMON GRASS.—A reaction appears to have taken place in this oil. The market will probably now become more settled, as it is understood that nothing for arrival is to be had before July-August shipment. The present price of spot stuff is 5d., and for July-August stuff 1d. c.i.f. is looked upon as a bid probably acceptable.

CINNAMON.—Damaged *Chips*, of which 22 bags were offered at auction this week, sold at 2½d. *Quills* are firmly held, and in anticipation of next Monday's auctions, holders are not anxious to do business; prices are nominally the same.—*British and Colonial Druggist*, Feb. 25.

COCONUTS IN THE N.-W. PROVINCE.

COCONUT CULTIVATION

and if nothing unforeseen occurs, coconut crops will be good. But prices are very disappointing and have been during the whole of last year as well, thereby seriously affecting the income of estates. A consolation is always found in having companions in distress and coconut estate proprietors have the grim satisfaction of knowing that the ramifications of exchange have smitten their tea-planting brethren as well. Dividends of prosperous Companies have been reduced by a half.

THE NEXT SANTOS COFFEE CROP.

There was a meeting at the Associação Commercial in Santos on the 1st inst. to receive the reports of the commissions appointed to estimate the next coffee crop marketed at Santos. These commissions were instructed to visit the districts assigned to them and obtain the best information possible. They reported as follows—the districts being the three main railway systems of the state of São Paulo.

Total estimate of Santos crop: 4,250,000 bags.—*Rio News*, Feb. 8.

THE LATEST IN BARK AND QUININE: MANUFACTURERS VS. PLANTERS.

Cinchona Bark dropped 20 per cent. in price at the last Amsterdam auctions, but over 60 per cent. of what was offered was either bought in or withdrawn. That much we told our readers last week. We have now to add that quinine has been reduced 3d per ounce in price by the leading English manufacturers, and 2½ per ounce by the large German makers in the combination. This seems a simple relation of cause and effect, but we are all accustomed by this time to look for something much more mysterious than such an easy explanation in the case of cinchona bark and quinine, and very few amongst the large buyers and sellers of quinine who have thought about the subject, have contented themselves with such a solution.

It is the same with us, as our readers must know from what we have said on previous occasions. There has not been a case of a natural drop in bark followed by a natural drop in the refined product made from it. We know that strenuous efforts have been made of late to keep up the price of cinchona bark to the satisfactory level it reached two auctions ago, and we conclude from fairly obvious signs that perhaps equally strenuous, but better managed, and certainly more successful efforts have been made to reduce the price. What was the reason for this latter form of energy? If we bear in mind one or two of the latest developments in the quinine and bark markets we shall find one of the most satisfactory explanations. Java bark growers and importers have at last shown a willingness to com-

bine for their own good. They have even seriously set on foot and brought to a head at one spot an attempt to handle their product all along until it is ready to go in the most easily used form to the consumer. Such an effort, if wholly successful, would be little short of disastrous to the already established makers of quinine, and these are using every means to break down such an organisation. They wish to show the bark sellers that it is no good their combining to keep up the price, for the latter is twice reduced, just after the combination is effected. And then when Java quinine, as we told our readers last week, has reached Amsterdam, and as we hear is now in London, in New York, and in Havre, they take the readiest means of reducing the value of the Java alkaloid by dropping the price of their own, at the same time leading the planters in Java to think that it would be better to come to terms with them, say by supplying bark to the proposed factory in Java, or in any other way which the manufacturers wish.

That is our deduction from information we have published and more which we have received and not published from various sources. The drop has no doubt come as a disappointment to many second-hand holders of quinine, but in spite of this dejection they show a noteworthy determination to hold on to their stock, and for this course they have good grounds to support them. There is much to indicate that this decline can be only of a temporary character, and that quinine must go forward again very shortly.—*British and Colonial Druggist*, March 4.

QUININE DOWN AGAIN.

"Never prophesy if you don't know" is an adage peculiarly applicable to quinine. The cheapening of cinchona-bark at the Amsterdam auctions last week suggested a fall in quinine, but manufacturers of the alkaloid have not been in the habit of fluctuating its price with the rise and fall of bark. That is a fact of which statistics are eloquent. Why, then, did they reduce the price of the alkaloid 2*d.* per oz. on Tuesday? Several reasons are given, the most likely being that, owing to the almost entire absence of purchasers during the past three months, the manufacturers are getting full up with the alkaloid, and, as second-hand holders have been quietly unloading at about 1*s.* per oz., the reduction is intended to meet them. It is also known that one or two small makers have benefited by the recent comparatively high price, but the threatened invasion of Batavian quinine is the most serious thing for the manufacturers' convention. Up to the present, little of this quinine has been seen; but it is on the spot, more is on the way, and its increase is only a matter of time. Therefore the present is the best time for the European manufacturers to squeeze it out. Our information from Java is to the effect that at least one quinine-factory is in full swing there, and another is in the course of fitting, so that the competition from that source is real, and has to be reckoned with. It would, however, be folly to calculate on a period of gradually-diminishing prices in the near future. Rises and falls in quinine are now chiefly of interest to speculators, who have been so often bitten that they are now exceedingly judicious in buying. The consumers' interests are not seriously threatened so long as the bark-producers and the quinine-manufacturers are contending parties. It happens that the end of the three months' trial of the bark-sellers' combination is synchronous with the fall in quinine, and it may be that bark will go cheaper; but, as we have already pointed out, there is little relation between the unit and the price of quinine. The unit now is 5*½c.*, quinine 11*d.*; at this time last year the unit was barely 3*c.* and quinine was 8*½d.*; and when the unit doubled (6*½c.*) quinine was 12*¾d.* But quinine has been sold at that when the unit was 3*c.* We must look to the men, not to the materials, for a solution of the riddle. We do not happen to be gifted with second-sight, but the falling clause, which one manufacturer announces that he will add to contracts, seems to be significant of much.

—*Chemist and Druggist*.

RECENT PATENTS.

The following are abstracts of recent specifications of inventions for which English patents are applied for. The complete specification of any patent can be obtained by purchase through any money-order office, where postcards price 8*d.* each, for ordering patents are obtainable. The number of the patent and year are specified at the end of each paragraph:—

Preparation of Tea for the purpose of rendering the infusion more digestible.—J. A. Martin, grocer, and F. Davis, analytical chemist, London. Moist tea with a solution of gum-arabic, or gelatine, or albumen, and, while it is still moist, sprinkle with a powder composed of:—Tartrate of soda, 2; neutral tartrate of potash, 1; sulphate or soda, 1 bicarbonate of soda, 2; and dried carbonate, 16; with the object of preventing the prejudicial effect of the tannin. (27,460, 1897).—*Chemist and Druggist*, March 5.

NEW METHOD WITH CHINA TEAS.

A Shanghai correspondent writes us by last mail: It may possibly interest you to learn that a company is being formed to make tea by machinery entirely under Chinese auspices, to be under the safe protection of H.E. the Viceroy Chang-chi-tung, and the finances to be controlled by the foreign Commissioner of the Imperial Customs at Hankow.

The scene of operations to be commenced is in the Oopack district of Yung-low-toong, some distance above Hankow, where godowns are already in existence, which were used by Russians some years ago. Capital R80,000, in 800 shares of R100 each, grantable to and holdable by respectable Chinese.

Experts are to be engaged from Ceylon, in the first instance, to instruct the natives in the method of working machinery. Some machinery has been ordered from home, and more, we understand, is to be ordered in Ceylon, where a gentleman has gone to have a look all round at the situation there.—*L. and C. Express*, March 4.

THE MADRAS PADDY CROP.

The Madras paddy crop is reported to be damaged by insects in parts of the Godavery and Malabar Districts, diseased in North Arcot, and withering in the Carnatic District. Elsewhere the condition of the crop is reported to be fair. The average outturn for the whole Presidency is estimated at 66—the normal being represented by 100. It is probable that the total area cultivated during the whole year may come up to 6,968,200 acres and the corresponding yield may amount to 57,944,700 cwt. of cleaned rice, or about 20 per cent more than in the previous year.—*M. Mail*, March 19.

PLANTING NOTES.

COCOA-BUTTER.—The result of the Amsterdam auctions is reported in a separate paragraph. At the London auctions, 50 tons of *Cadbury's* make were sold at fluctuating prices, the average working out at about 9*½d.* against 9*¼d.* in February and 9 9-16*d.* in January.—*British and Colonial Druggist*, March 4.

LEMON GRASS OIL.—The botanical origin of this oil is a matter of some doubt, and it is probable that various species of *Andropogon* are used in its preparation. Siedler states that various species of these grasses belonging to the *Andropogon* family flourish in German East and West Africa as well as in East India, which yield an essential oil. It is possible that these colonies may shortly export this oil.—*British and Colonial Druggist*, March 4.

PROSPECTING FOR PLUMBAGO.—We learn from Madawelatenne that Captain Tregay is still very busy prospecting for plumbago and seems as sanguine as ever.

EUCALYPTUS TREES have grown so well in the Nilgiris that they threaten to push houses, near which they grow, out of existence, and steps are to be taken to have them felled.—*Chemist and Druggist*.

A DRY REGION!—The rainfall of Santiago, Chili, last year measured 335.20 millimetres [nearly 13½ inches.] The mean average for the last 31 years was 328 millimetres [nearly 13 ins.] The rainy months are May, June and July, the rainfall in May last year measuring 296.48 millimetres [nearly 8 1/6 inches.]

RISE IN RUBBER.—In consequence of the advance in the price of crude rubbers, the principal firms (seventeen in number, and several of the first importance) notify—says the *British Trade Journal*, March 1st—the trade that their prices for mechanical rubbers are advanced 10 per cent. from the 10th ult.

JAVA QUININE.—We (*British and Colonial Druggist*) heard a few weeks ago that a quantity of quinine sulphate made by Bandoeng quinine factory in Java, to which we have referred several times of late, was on its way to Europe, and our Amsterdam representative now says that 21 cases of quinine, each containing 12 tins, holding one kilo, have arrived in Amsterdam per ss. "Talaman" from Java, and will probably come very shortly on the Amsterdam market.

KOLA NUTS.—According to Knebel, who discovered kolanine in kola nuts, this glucoside is broken up under the influence of a special ferment, into caffeine, glucose, and a red colouring matter. He considered that the action was not completed till the nuts were dry, and that, therefore, the dry nuts contained a relatively greater amount of caffeine than the fresh nuts. François has, however, examined the fresh and the dry nuts very carefully, and finds that desiccation does not at all alter the proportion of caffeine contained in the nuts (allowing for the moisture driven off, of course); nor are the nuts containing the greatest proportion of red colouring matter richest in alkaloid, which should be the case, according to Knebel.—*Repertoire de Pharmacie*.

AMSTERDAM BARK MARKET.—Our Amsterdam representative sends us further information concerning the Amsterdam bark auctions of last week. The bark offered was distributed among the following species and varieties: Succiubra, 36,626 kilos.; Ledgeriana, 508,162 kilos.; Calisaya, 368 kilos.; Officialis, 1,992 kilos.; Hybridis, &c., 36,424 kilos. Root Bark formed 43,942 kilos among this. Our readers would notice that in the haste of going late to press with last week's telegram, the separate purchases were added up incorrectly, the total sold amounting really to 12,223 kilos of quinine, which left 16,724 kilos unsold. A printer's error made the purchases of the Frankfort and Stuttgart factories appear as 70 kilos instead of 0 kilos.—*British and Colonial Druggist*, March 4.

WOOD OIL.—The Consular Department at Washington have been collecting information relative to the source of wood oil, so extensively used by the Chinese as a varnish. Woodwork in China is almost universally varnished with this oil, and on native crafts on the inland waters of China the oil takes the place of paint. Owing to its poisonous nature, it is suggested as a useful component of ships'-bottom compositions for preventing marine growths. The exploitation of the wood-oil tree promises to reveal the secret of Chinese india-ink, as it is stated that the sort produced by burning the wood oil is the basis of the most expensive kind.—*Chemist and Druggist*, Feb. 26.

MINERAL PRODUCTION IN INDIA.—The following table shows the products for 1896 as to which reliable statistics of output are available according to Dr. Geo. Watt, C.I.E.:—

Salt	1,026,744 tons.
Coal	3,818,013 "
Iron ores	13,776 "
Petroleum	15,057,094 gallons.

THE COPPERAH MARKET.—The market is in a very unsteady state. Top prices were given during the week for all kinds and grades. "Carts" are seldom bought and the arrivals of boats during the week were up to the average. As much as R42.25 per candy was paid, but the average for the week for well-dried Calpentyne was R41.50. Maravilla, Nengombo and Madampe fetched R38 to R40 per candy. It is believed that a large stock will be brought down to the market before long, as it is usual to receive a large quantity before Easter and the Sinhalese New Year. This time the stock will be greater than the corresponding season of last year, as the crops are expected to be heavy after the last small season. Owing to the prevailing prices in the market, the price of coconuts has in a measure gone up. They are also scarce, as dealers prefer to convert them into copperah and secure top prices, rather than sell them for desiccating and shipping purposes.—*Cor.* of the "Examiner."

WATEGAMA: TEA PRICES.—There seems great differences in prices of tea on estates close to each other in our district. Is it in the strength of the soil or in the manufacture?

G		H		W		M	
1,265 broken							
pekoe '49	2,665 at '41	500 at '39	1,623 at '34

WOOD ASHES FOR FLOWER GARDENS.—There is no particular difference between equal weights of ashes from hard or soft wood. The reason for the erroneous common opinion on this point is due to the lightness of soft wood ashes, which makes it necessary to use a very large bulk of them to get the equivalent of a small bulk of hard wood ashes. As to using ashes as a substitute for stable manure where the latter cannot be obtained it must be said that ashes are only a special fertiliser containing potash and a little phosphoric acid. Stable manure contains these and adds a considerable content of nitrogen, which is usually the greatest need in flower growing. For this reason ashes do not make a good substitute for a stable manure, but in ashes and nitrate of soda the various needs of the plants are ministered to. If leaf mould is to be had, its use in connection with ash should produce good results.—*American Agriculturist*.

USES OF COCONUT OIL.—An Indian journal says that in that country a large amount of native soap is made from coconut oil by merely boiling it with dhobies' earth (impure carbonate of soda), salt, quicklime, and water. The ley apparently is not prepared separately as a rule, nor with any attention to causticity. Coconut oil is still used to some extent in India as an illuminant by the wealthier classes, and almost universally for culinary purposes, also for anointing the body, and as a hair oil. European, American, and native doctors also apply it in many ways as a medicine. In candle making, coconut oil is not nearly so much employed as it was in former days, palm oil and other materials having to a great extent superseded it, as have palm kernel oil and earth-nut oil in the case of soap making.—*British and Colonial Druggist*, Feb. 25.

Correspondence.

To the Editor.

TEA PLANTING IN FIJI; THE "T.A."

Wainunu Tea Estate, Wainunu, Fiji,

22nd Jan., 1898.

SIR,—I note in the issue of November 1st, 1897, of your valuable paper, your comments on "Tea Planting in Fiji." There seems to me to exist a slight misconception with regard to the Labor question in this Colony. It is to a certain extent correct, that "scarcity and dearness" of labor are one of the drawbacks; although I presume you refer to the local supply only, viz., Fijians and Polynesians, and not to Indian coolies, who have never yet been obtained for this industry, and for its systematic working. A greater drawback is scarcity of capital, to enable the industry to be profitably carried on, by the introduction of the requisite labor supply, viz., the Indian cooly on similar terms, to the working of the Sugar Companies in this Colony—which were last year £13 7s 7d per caput for five years' term of indenture, and whose rate of wage is 1s (one shilling) per task per man and 9d (nine-pence) per task per woman. By arrangement on application a good percentage of women and children could be included in the number applied for, for tea garden purposes. It can hardly be said, that there is any scarcity in the supply of the cooly. As regards all other native laborers, except for certain works, they are out of the question, being unsuitable, unreliable, and too expensive in every way, and for the regular and systematic work of the tea garden, nowise adapted. But on the question of the Indian labor supply, there is much to be said in favour of this colony for tea growing, and even too favourably compare with other tea-producing countries; when it is taken into consideration the increasing cost and difficulties, of obtaining and keeping a trained body of labor in districts, where many hands are required at one and the same time. And for the production of good tea, at its lowest cost,—trained pruners and pickers, are indispensable, the 5 years' term of service to the plantation, and further five years residence in the Colony, give this requisite supply of skilled labor. It is true that the rate of wage is far too high, which is only too evident in many ways; but it is only reasonable to hope, that by a combined effort on the part of the Planters, and with the favourable consideration of the Government, that some reduction could be effected, and to meet the necessities of the various industries will be made, as in that direction appears to be the necessary alterations of labor conditions, to which you very rightly refer.

There is no doubt that when coolies were first introduced to induce them to come to a new and untried country, and the purchase of their food supplies being an unknown quantity, the higher rate of 1s and 9d per task respectively, was fixed upon; but when it is taken into consideration that this Colony has been found to be so well adapted to the Indian cooly, by reason of its extremely healthy and excellent climate, for working in, also the abundance of everything in shape of food and further the large sums of money and property these Indians are amassing, it is beyond all doubt, that 9d per task per man and 6d (sixpence) per woman would be an

ample wage, more especially for the light and agreeable nature of the work on tea gardens, and it is imperative that something must be done in this direction.

All the other essential conditions to the successful production of tea in this Colony, are most favourable. The tea itself is of a most useful character; in cup, it is clear and soft having sufficient body and strength without too much astringency or pungency, being in medical opinion an excellent tea to use.

There is abundance of good land—land exactly suitable for cultivation of tea.

Every facility exists for means of access and transport, as the tea can be loaded on board vessels at the factory door. There is an ample water supply for power purposes, in the numerous streams that abound. Good fuel is plentiful and ready to hand. The climate is all that can be desired for tea, and for health also, which cannot be said of most tea-producing countries; the tea flushes freely nine months out of the twelve.

On the question of cultivation, it is found here, on this estate, that the Planet "Junior" Horse Hoe, works very successfully, giving excellent results, both as regards cheapening cost of upkeep, and in improvement in the bushes, (all being 6 × 6 and 6 × 3 planting). They leave but little weeding to be done by hand in between the plants; by keeping them going round the blocks, no weeds can grow, while the soil is kept beautifully loose and friable. There is no wash, and no harm to bushes in any way. One Indian with a horse does from 3 to 4 acres every day. Of course for this style of cultivation, a suitable lay of land is necessary, but of such there is abundance, viz., very slightly undulating table-lands at suitable elevation. The system allows the tea to be worked with a smaller force than would otherwise be necessary; the tea also flushing steadily for 9 months, permits of the flushes being taken off, with a smaller force of labor than is possible, where they come on with a rush and shut up in the cold weather.

There is much more that could be said, but I will not trespass on your valuable space anymore.—I would here like to mention, how much your *Tropical Agriculturist* is appreciated and what a useful work it is, more especially to those who are engaged in new and distant countries. I trust the foregoing, will give you and your readers, a more correct and hopeful opinion of tea-growing here, and of the value of tea-property in this Colony; also that it may serve to show that we have good reasons for hoping to obtain something like a decent return, for all the years of hard work and anxiety we have put in, in bringing this tea to its present position.—I am, yours faithfully,

G. LE BARRATT.

"ARTOCARPUS NOBILIS"—A QUERY?

Bentota.

DEAR SIR,—Can any of your readers kindly let me know whether there are two varieties of the "Gan Del" (*Artocarpus nobilis*). If so, what difference is there between the trees. I have seen a tree with leaves somewhat like those of the bread-fruit, which the natives say is a young plant of the "Gan Del;" but when asked why the leaves are divided they say they change when grown up. Is it possible that such a transformation could take place during the growth of the tree?

I may also mention, that I have seen a "Gan Del" tree possessing a single branch with leaves like those of the bread-fruit; also a young "jak" tree possessing a few divided leaves and young "Gan Del" plants with the ordinary leaves.—Yours faithfully,
"INQUIRER."

[In Ferguson's "Timber Trees of Ceylon" there are four varieties given of *Artocarpus*:—"Nobilis" or "Delgaha" of the Sinhalese; "Integrifolia" or "Kosgaha," Jak; "Incisa" or "Ratadel," Breadfruit and "Lakoocha" or "Kanna-gona-gaha" of the Sinhalese. Can there be confusion between the first and last in the Bentota district? —ED. T.A.]

DEAR SIR,—In reference to "Inquirer's" letter it is not by any means a rare occurrence for the leaves of young plants to be totally different in outline from those of older plants of exactly the same kind or even of older branches of the same tree. A good example of this transition of form is seen in *Aleurites triloba*, the Telkekuna of the Sinhalese, or "Candle-nut" of Europeans. This in the young state has the leaves distinctly three-lobed, hence the specific name; but as the plant attains to some feet in height, the leaves gradually lose their lobed character and become perfectly egg-shaped, thus puzzling persons who look only to grown-up trees for the origin of the specific name.

Regarding the query put by "Inquirer" however, *Artocarpus nobilis*, the Gan-del, Wal-del, or wild Breadfruit, is a distinct species, not a variety, and, as far as I have observed, does not have the leaves lobed or divided in the young state. In this respect probably *Artocarpus incisa*, the Rata-del or real Breadfruit, has been mistaken for the former, the specific name denoting the particular described by "Inquirer." This has large and deeply "cut" leaves, the segments being again "cut" in the edges, and is altogether, in most opinions, a more noble tree than *A. nobilis*, despite the name. The fruit of *A. incisa* (Breadfruit) is usually quite round, contains no seed and is, perhaps on this account, much more in favour with curry eaters than the long oval-shaped wild Breadfruit.

Artocarpus Lakoocha, or Kanna-gonna, is also equally distinct both in general appearance and in the fruit, which is much smaller than that of the other two above mentioned, and can scarcely be considered edible in comparison with them. There are of course several recognized varieties of *Artocarpus integrifolia* (jak), some being much better appreciated than others by the natives.—Yours faithfully,
DEL JATHI.

Bentota, March 5.

DEAR SIR,—There is no confusion between "*Artocarpus Nobilis*" and "*Artocarpus Lakoocha*" in the Bentota district. "Inquirer" has not often seen "Gan-Del" trees when young. In fertile places the young tree has leaves similar to those of the bread-fruit or "*Artocarpus Incisa*." The leaves change when the tree grows old. But, according to the quality of the timber, there are four distinct species of "Gan-Del." They are "Haburu-Del," Patta-Del, Alu-Del, and Meean-Del." The first word in each case will explain the quality of the timber. Of these, the last two are valuable and the first two very inferior timber. The timber of "Haburu-Del" easily breaks in pieces, and that of "Patta-Del" is somewhat tough. "Alu-Del" has an ash colour and "Meean-Del" timber is like the horns of a buffalo, hard and strong. But in all cases the tree looks alike.
"C."

MANGIFERA INDICA--THE MANGO TREE.

SIR,—Dr. Dey's notes* give valuable and reliable information and I make the following quotations

* Indigenous Drugs of India.

from it:—"Esteemed by both Europeans and natives as the most delicious of Indian fruits. The ripe fruit is very wholesome, nourishing, and highly antiscorbutic; the unripe fruit is made into refreshing *sherbets* and custards, into pickles and preserves, as a sour ingredient in certain curries, and as the principal ingredient of the chutnies so popular in Indian cookery and exported to Europe. The kernel inside the large flattened 'stone' or seed contains about 10 per cent of tannic acid, of which an enormous quantity must be wasted each mango season, the seeds not being utilized.

"The pulp of the ripe fruit contains a trace of gallic acid, with citric acid and gum; the unripe fruit contains about 20 per cent of free acids, tartaric, citric and malic. The bark of the tree contains tannic acid and from it exudes a pink-coloured gum partly soluble in water. The fruit exudes just before ripening a resinous substance with an odour of turpentine. The blossom is regarded as astringent.

"*Medicinal uses*.—The powdered kernel of the seed, called *amar kusi*, is used as an astringent in diarrhoea, and as a remedy, also as an anthelmintic. A fluid extract of the bark has been recommended in hemorrhages. The popular idea among Europeans in India that the mango fruit is productive of boils and skin eruptions is a fallacy, and has probably arisen through the coincidence of the occurrence of those symptoms with the mango season, the end of the hot season and the beginning of the rains. On the contrary as has been indicated, it is a valuable antiscorbutic, unless when used immoderately."

I have italicised the words *ripe*, and *immoderately* so as to lead to the accepted view that only ripe fruit should be indulged in and that the delicious flavour should not be allowed to cause excess of indulgence. The unripe fruit should be always cooked in some manner of preparation before it is used as a food or a condiment. The acids in the unripe fruit make it an extremely valuable addition to saltish curry, and a thin sauce containing mango is pleasant enough with salt-beef, timed salmon, kippered herrings, bloters etc.

After all, moderation in the use of a good thing is the golden rule. The fate of the cows fed to excess on mango fruit with the express intention of producing pathological results, and the experience of many that a few mangoes has a marked diuretic effect teaches the value of moderation. The best mangoes do not cloy, but whet the appetite, hence heavy meals of the ripe fruit until satiety is attained with some difficulty. The most simple rules are as follows:—Eat only ripe mangoes, and those only after a meal, and do not eat any after evening; it is a positive disadvantage to have a juicy bulk of fermentable stuff in a stomach when one goes to bed.

It is worth noting that in certain varieties (and the cheaper kinds especially) a cluster of glands round the insertion of the fruit-stalk secrete a terebinthine resin which can permeate the pulp and ruin much of the flavour of the fruit if the stalk end be the uppermost when the mango is lying in store or cupboard for a few days; hence, another rule, always lay by mango fruits with the stalk end undermost.—Yours truly,
MEDICO.

EFFECTS OF FEEDING CATTLE ON MANGO LEAVES.

SIR,—You mentioned, in your reference to Sir Grand Duff's lecture before the Society of Arts, the deleterious effects of mango leaves on cattle; but what perhaps is stranger is that animals are fed on this peculiar diet with a specific object, being made use of as so many machines. The following facts gathered from the Kew Bulletin No. 39 should prove of interest to some of your readers. Indian felloe or purree is described in ordinary books of reference as a colouring matter highly esteemed by artists, but its origin was little known till comparatively lately.

In 1883 the Kew authorities made enquires as to its preparation at the request of Sir Joseph Hooker, with the result that a report on the subject was forwarded by the Indian Government. Piuri (as it is also spelled) is sometimes got from mineral sources, but it is inferior stuff. The real article is prepared chiefly in Monghyr from the urine of cows kept on a diet of mango leaves and water, which increases the bile pigments and imparts to the urine a brilliant yellow colour. Cows thus fed are believed to die within two years, though the cattle-keepers will not admit this is so, and will show cows from which they say that the dye has been got for four years.

The cows, it is admitted, have a very unhealthy appearance, and to prevent the animals breaking down altogether an allowance of ordinary fodder has at times to be resorted to, though it reduces the amount of piuri obtainable. Owing to the injurious effects on the cows, the manufacture is confined to a small number of people who are looked down on by their fellows. The cows are made to pass urine three or four times a day by a process of massage of the urinary organs, and indeed the animals after a time cannot urinate unless this is done. The urine is collected in earthen pots which in the evening are placed over the fire. The heat causes the yellow dye to precipitate. It is then strained, the sediment made into a ball and dried. The merchants who export the stuff give the manufacturer on the spot R1 per lb. (mineral piuri only fetches 4d per lb.). The cost of mango leaves also no doubt restricts the manufacture, the produce of a moderate-sized tree, say 30 feet high, fetching R2. An average cow produces about 3 qts. of urine per diem which yields about 2 oz. of piuri. D.

MR. HARCOURT SKRINE ON "EXCHANGE."

Osborne, Hatton, 5th March 1898.

SIR,—I send you copy of a letter I addressed by last mail to a London Newspaper on the subject of Exchange.

It represents the views of an individual Ceylon Proprietor, who, having been through the Coffee ruin, prefers to anticipate the sowing of a like calamity for Tea.

I have purposely omitted any reference to a gold coinage because, if this is to be accorded India, it can only be by an act of grace on the part of the Home Government and we should not ask ourselves for what we may not be prepared to pay.

What we have a right to insist on as capitalists working in this country is an honest and sufficient currency whether in gold or silver. Those who sympathise with these views should remember that the situation is only intensified by delay and that the Spring in London is the time for action.—Yours truly, HARCOURT SKRINE.

(To the Editor of the *Economist*.)

SIR,—In December, 1893, I with several others pointed out to the Press in Ceylon and to my then agents in London the Premium that was being put on China Tea by the closing of the Indian mints.

The reply, in Ceylon, was that our influence as Producers would not be weighted in the balance with the necessities of the Indian Government,

and in London—I was told that "China was a dead dog, that he were doing very well as it was and that it would be time enough to make a fuss when the shoe really began to pinch." For four years the experiment of drying up the currency has been going on and we have been content to abide our souls in patience, waiting the proofs of our convictions—convictions which have been ever disputed as the Exchange ebbed and flowed. The experiment is now complete and the one and four-penny rupee is left high and dry for all to inspect. Let us take stock of it as "selfish" producers first of all, and then as capitalists to whom the adjective selfish is inapplicable.

We will begin by admitting that the theory of China Tea being a dead dog as so far held good. No medicine can cure a man afflicted with a mortal disease. But does this affect the power of the Bounty in raising other and new competition? The Chinese on the strength of it are starting a new machine-manufactured Tea Industry; the Japanese are pressing on with their cultivation; and there lies in the Far East, only just developing, Ceylon's future great rival "Formosa." We have seen how the West Indies have been ruined by the Sugar bounties.

This was the doing of foreign Governments and perhaps could not be met by free-trade England, but here we have our own Government putting a premium of 40 per cent. on the opening up of Japan and Formosa. Is Ceylon to go the way of Barbadoes? is a question that may well be asked long before the next general election.

Now as regards the capitalist, who not being a producer, seeks to invest in India or Ceylon. How does the currency appear to him? He sees the Indian Government so hard up for its own rupees that it has passed a bill authorising the issue of notes by the currency department against deposits of gold in London. He sees the banks in the East charging from 12 to 15 per cent on overdrafts; the Rupee Tea Company shares fallen 40 per cent in a few months, though the price of Tea has only fallen 5 per cent; all pecuniary enterprise paralysed; and the lately prosperous Ceylon reduced to the condition of a fraudulent South American Republic.

The capitalist classes are thus thrown back, out of civilisation, into the middle ages to compete—without a Currency machine their own—with the modern barbarian provided with a Currency and a Bounty put upon his products by an English Government. The experiment has proved that the first duty of a Government is to provide an honest Currency, and to supply its revenue in ways apart from this. The Government of India could always have done this; for the fall in silver was no injury to the country and what the Government lost in Revenue the Tax-payer gained. It should therefore have re-adjusted its taxation and not tempered with its Currency. The only course to avert the financial ruin of India and Ceylon is for the Government to re-trace its steps, appoint statisticians to ascertain the supplies of silver needed to re-habilitate the Currency and purchase these by advertised instalments. Who would this injure? The Manchester shipper has had his unfair innings already and can well afford to discount the prospective falls in Exchange or send his goods to African markets.—Yours,

HARCOURT SKRINE,

THE CURRENCY PROBLEM FOR "LITTLE CEYLON."

Colombo, 5th March, 1898.

DEAR SIR,—I have read with interest the articles and correspondence in your columns dealing with the Currency Problem. But it seems to me that we are all at present groping in the dark, owing to the want of a sufficiently wide and complete basis to argue upon. So far we have had expressions of opinion based upon the real or fancied interests of the particular writer. What we want is a well-reasoned argument, dealing with the varied interests of Ceylon, shewing how far they are antagonistic to or coincident with each other, and explaining what is our true policy in currency matters when these different interests have been adequately ascertained and balanced against each other.

I suggest that such an argument must take into consideration *six* different classes:—

1. Those who produce goods in Ceylon, the cost of production of which is mainly a silver cost, with the intention of selling them for gold.

2. Those who purchase or manufacture goods on a gold cost of production, with the intention of selling them for silver.

3. The Government considered as a corporation (in other words *the nation in its capacity as Taxpayer*, for it is of course the Taxpayers who have to pay for the Government.)

4. Those whose wages or salaries are a fixed number of rupees.

5. Those who produce or trade in goods locally produced and also locally sold, so that silver is their cost of production and also the price for which they are sold.

6. The whole body of *consumers*.

Everybody in Ceylon is comprised in one or other of these classes.

The argument would consider the effect on each of these classes. (a) separately (b) as they act, and react on each other, of the courses logically open to us, which are

1.—To have rupee standard based on the bullion value of silver. This would imply, of course the reopening of the Indian Mints or else a separate Ceylon coinage

2.—To keep the present artificial rupee

3.—To establish a gold standard either (a) with or (b) without an actual gold currency.

4.—By agreement with other nations to try to maintain a double standard of gold and silver. This is of course Bimetallism.

The argument would conclude by explaining a practical scheme for carrying into effect which ever of these four courses appeared to be most desirable. It is obvious that such an argument must be based on facts and statistics, extremely complicated and, as far as I know, very imperfectly ascertained at present. But to adopt any policy or currency scheme, without such exhaustive investigation, is simply to take a leap in the dark. My practical conclusion is that the press should combine to urge most strongly that a Commission of Inquiry should be appointed to ascertain the data, on which alone a sound policy can be adopted. Unfortunately it is doubtful whether there are trained inquirers in Ceylon competent to conduct such an investigation. For it is necessary to *analyse* the facts as well as merely record them. For instance it is not sufficient to state that the profits of a particular tea estate have fallen recently. It is necessary to go further and ascertain to what cause or causes this fall in profits is due—there are several possible causes,

such as deterioration of quality of the tea etc.—and disentangle the effects due to currency from the effects due to all other causes. I am afraid no one in Ceylon has either the leisure or the necessary qualifications for such a task. But England has many such men, and it is certainly worth while Ceylon's while to procure one of them for this necessary investigation.—Yours faithfully,

CURRENCY REFORM.

COST OF PURE GOOD MILK.

DEAR SIR,—In his report on Colombo dairies, the Mayor says that "pure and good milk cannot be supplied at a profit for a less sum than 25 cents per bottle." This is just about correct, for though it may be said that the Government Dairy makes a profit over milk sold at 18 or 20 cents, it must be remembered that no rent is reckoned and no salary of Superintendent or Veterinary Surgeon taken into account. With small "Coast," cattle giving on an average 4 or 5 bottles of milk, or Sinhalese cows with a milk yield seldom exceeding two bottles, 25 cents will not leave a very large margin of profit if only pure milk is to be supplied. The Lunatic Asylum is now paying 22 cents per bottle for milk from cows kept on the premises,—so as to ensure the purity of the milk,—but here again the milkman gets the premises free.

ONE WHO KNOWS.

TEA CULTIVATION AND ECONOMY.

Ambegamuwa, March 11.

DEAR SIR,—Any planter in Ceylon will tell you that no new conditions and not all the pressure of Companies which may be brought to bear can ever effect any saving on the working of tea estates. Expenditure has been worked out for years back to its lowest possible limits and in some instances so fine that the Superintendent had to carry forward a debit to the following year and try to keep to the allowed expenditure in that way. No sir! that is not the way to get out of our difficulty. It is simply a monstrous impossibility. All that can be done is to sack Superintendents wholesale and let your estates up in weeds, sort of semi-cultivation; these are the only two items on which they may try any improved method of curtailing expenditure and stop all extensions; but otherwise there is nothing that can be done which has not already been done. Our only salvation lies in our having a rupee of our own and allowing India to wallow in her own mire. Why should we sink when there is no necessity for it. If only our legislators and financial men put their heads together they can soon work out a currency for ourselves and fix it in such a way relative to our trade with India, as will not harass it and thus save the colony from this impending ruin. C. T.

MR. MASEFIELD'S FINE CATCH AT NUWARA ELIYA.

Nuwara Eliya, Mar. 13.

SIR,—It will doubtless interest many of your readers to hear that I caught with a fly on the 10th two trout—one weighing 3 lb. 3 ozs. and the other 9 lb. 10 ozs. They both were taken in the stream flowing into the Nuwara Eliya lake. The largest trout hitherto taken in Ceylon, I believe

was one caught by Mr. J. M. Purdon in 1896 weighing 8 lb. 4 ozs. The length of my trout was 2 ft. 1½ in. and girth 1 ft. 5½ in., the length being short for its weight. It was a female fish and unfortunately full of ova, and had I known this in time I would have tried to preserve the fish for breeding purposes. As it is I had it photographed and sent it to Mr. Jacob, of Kandy, to be set up. I hope he will make a good job of it.

An extraordinary occurrence was, that whilst playing the fish, a fine otter appeared on the scene and behaved in the most excited manner jumping in and out of the stream and swimming round and round with its head out of the water within a few feet of me and making a peculiar hissing snorting noise which otters do when excited. Whether the otter wished to help an old friend in difficulties, or to seize the opportunity of helping itself, or thought that I had hold of another otter (and I was not quite sure myself, for sometime that I had not) it is difficult to say. It will be interesting to note to what size trout will grow to in Ceylon.—I am, &c., H. V. MASEFIELD.

[This letter will be of peculiar interest to *The Field, Land and Water and Fishing Gazette* to whose editors, copies of this *Observer* will be sent.—ED. T.A.]

SCIENTIFIC MANURING ON CEYLON PLANTATIONS.

Colombo, 16th March, 1898.

DEAR SIR,—I have pleasure in handing you my circular and would direct your special attention to the testimonial of Mr. A. C. Bonner, of Kirkoswald estate as to the value of these fertilizers.

The old custom of simply applying castor-cake and raw bones may have answered very well in the past, when the margins of profit were large; but with many adverse circumstances besetting the tea industry in the present day, it becomes a necessity for producers to avail themselves of the advantages, which the progress of Agricultural Chemistry has placed within their reach, in order to bring about cheaper production and quicker returns for the money expended on manure. This end I submit, can only be accomplished by the application of a properly constituted fertilizer, based upon the average composition of the soil, the special conditions of climate and the requirements of the crop. The special fertilizers may safely be said to comply with all these conditions, and as Mr. Bonner's testimonial shews, they may be relied upon to give satisfactory results. Another point in their favour is that they are of a very concentrated nature, which means a great saving in the cost of transport and application, and adds to the profits of the crop.—Yours faithfully,

A. BAUR,
Ceylon Manure Works.

"THE CRISIS IN THE TEA INDUSTRY:" TEN MILLIONS OF RUPEES LOSS FROM EXCHANGE AND LOWER PRICES IN 1897.

SIR,—Figures published by your evening contemporary shew depreciation in the value of local Tea Share Scrip of close upon six million rupees in 14 months, and of this sum I may notice in passing that nearly one-third is depreciation on shares in Companies managed (and ably managed too) by the firm of which the Chairman of the Chamber of Commerce is a partner. He it was who, a week or two ago, thought it the duty of the Chamber to approve "in no undecided way"

the broad-gauge railway to Jaffna and to recommend the appropriation of Rs.1,500,000 from the general revenue during the next three years. The proposal was unanimously adopted! In the earlier part of his speech the Chairman commented on the bad effect exchange and low prices had had upon Ceylon trade for 1897; but his reference to this was most offhand and casual, and it is perfectly certain that he and the other members of the Chamber were unaware of the actual loss inflicted on hapless tea shareholders and proprietors, as a body, during the previous twelve months. As is shown by the prices referred to, the actual depreciation on shares was nearly six million rupees. It is rightly said that the fall is partially attributable to the undue inflation of 1895-6; but there is no gainsaying the fact that the primary cause was the fall in the average price of tea, and the higher exchange ruling for the greater part of the year. The average price of Tea for 1897 was 5-8ths of a penny less than in 1896, and as our shipments aggregated 116,054,567 lb., the loss to the tea industry through the fall in price was £301,183 or upwards of 4½ million rupees, independent of exchange! If we go a step further and work out this, what do we find? A loss of somewhat over 5½ million rupees! Total on Tea and Exchange say Ten Million Rupees.

It is no use trying to blink the fact that with Exchange as it now is, coupled with a low average for tea, there are less prosperous times ahead of us, and it therefore behoves the Government not to fritter away any surplus revenue—that may be required to afford relief, by lower railway rates for produce,—on a fancy scheme that cannot possibly give any return, or benefit many people for years and years to come; but to at once push on the Kelani Valley Railway, the success of which is assured from the day of opening, and which will bring untold relief to a district that suffers much for want of proper means of transport, while also benefitting many thousands of natives.

Reports of meetings of Tea Companies held since the Chamber of Commerce discussed the Railway question, show that the days for economy and caution have arrived. Firms are called upon to reduce their Agency charges; directors their fees; superintendents their salaries; and it is not at all unlikely that London and Colombo Brokers will be asked to consider the advisability of reducing their commission sales from 1 per cent to half per cent, which would mean a saving to the planter in one year of about Rs250,000.

Things are bad enough as they are; but if the island is to be saddled with the expense of Railways that won't pay for generations to come and the general revenue surplus be taken away for that purpose—the time is sure to arrive (and possibly in Governor Ridgeway's day) when we shall have to follow the example of the West Indian Colonists by appealing to the Imperial Parliament for relief.—I am sir, yours truly,
A MAN OF BUSINESS.

THE SILVER CURRENCY QUESTION.

Kandy, March 11th, 1898.

Sir,—The Secretary, Planters' Association of Ceylon enclose copies of correspondence with the United Planters' Association of Southern India, on the Silver Currency Question.

A. PHILIP,

To A. Ronaldson, Esq., Secretary, United Planters' Association of Southern India, Madras.

Kandy, Feb. 23rd, 1898.

DEAR SIR,—Your letter of the 11th instant, with enclosure on the subject of the recent financial policy of the Indian Government in endeavouring to create an artificial rate of exchange, and inviting co-operation and support in representing the Producer's interests to the authorities, I now write to say that your communications were considered at the Annual General Meeting of the Planters' Association held on the 17th instant, and I confirm my telegraphic advice to you thereafter as follows:—"Letter regarding Currency Question duly received, resolution passed at Annual General Meeting resolving to co-operate in representing Producer's interests to authorities." For your further guidance, I now annex copy of the resolution above referred to, and would add that a further communication will be addressed to you later.—Yours faithfully,

(Signed), A. PHILIP, Secretary to the Planters' Association of Ceylon.

RESOLUTION REFERRED TO.

"That the Association recognising the extreme gravity of the existing conditions of exchange resolves:—1. To join the United Planters' Association of Southern India in representing to the authorities how disastrous to the interests of the Producer, European and Native, the artificial high rate of exchange has been. 2. To impress upon the Ceylon Association in London how essential it is that they should at once take steps to see that the Producer's interests are not thoughtlessly sacrificed in such a vital matter."

(Copy.)

United Planters' Association of Southern India.

Madras, 25th February, 1898.

The Secretary, Ceylon Planters' Association, Ceylon.

Dear Sir,—I duly received your telegram of 22nd instant reading "Letter regarding currency question duly received resolution passed a annual general meeting resolving to co-operate in representing producer's interests to authorities," for which I am much obliged.—I am, dear sir, yours faithfully,

(Signed) A. RONALDSON, Acting Secretary.

The Secretary, Planters' Association of Ceylon, Kandy.

Dear Sir,—I thank you for your letter of the 23rd instant, and I am pleased to learn the terms of the resolution passed by your Association at its annual general meeting, in support of the action which we propose should be taken to bring about a change in the Indian Government's present currency policy.

I enclose copy of a letter addressed by my chairman to the Government of India, giving expression to our views, and probably the views of all producers and exporters on the subject of the present artificial value of the rupee. This letter was necessitated by a communication addressed to that Government by the Madras Chamber of Commerce in favour of the Lindsay Scheme and it was felt that if we did not now raise a protest we might not have an opportunity to do so later.—I am, dear sir, yours faithfully,

(Signed) A. RONALDSON, Acting Secretary.

(Copy of Enclosure.)

From George Romily, Chairman, U. P. A. S. I.,

To the Secretary to Government of India.

Financial Department, Calcutta.

Sir,—As we observe that the Madras Chamber of commerce has recently laid its views on the currency problem before the Government of India, and as we note with alarm that it advocates the adoption of what is known as the Lindsay Scheme for establishing a gold standard and thereby fixing the rupee at about 1s 4d, I now have the honor to submit for the consideration of Government the views of this Association

on the subject, representing, as I believe they do, not only the interests of the educated European and native planters whom I have the honor to represent, but also the interests of the voiceless millions of native cultivators who are as yet unawaro of the heavy burden under which they are laid.

2. We agree with the Chamber of Commerce "that if India is to be saved from ruin, if she is to prosper, cheap capital is absolutely necessary to develop her great resources"; but we go further than this, and maintain that not only cheap capital is necessary, but also a rupee at its natural value in order that the export trade, which is the backbone of the prosperity of India, may not be handicapped.

3. Our two chief industries are the growing of tea and coffee. Our teas have to compete with Japan and China. Japan has recently adopted a gold currency, but has fixed her exchange (doubtless having that and other competition in view), at the present low rate ruling in silver standard countries, and is for all practical purposes one of them. China has a silver standard, and a practical illustration of her favoured competition with India was recently afforded by the starting of the Foochow Tea Improvement Company, which in its prospectus lays stress on "the advantage China now has over India and Ceylon in cheap silver, the exchange value of the rupee exceeding that of silver fully 25 per cent." But taking the present intrinsic value of the rupee at between 9d and 10d and the exchange value at 1s 4d the actual advantage in favor of China amounts to 60 per cent.

In like manner our coffees have to compete with those of Brazil and Central American States. Brazil has nominally a gold standard, but owing to bad financing the Milreis, its standard coin, has fallen in value during the past ten years from 27d to between 8d and 9d so that for all practical purposes Brazil is a country with a currency on a level with that of all silver standard countries. Costa Rica and the other coffee exporting countries of Central America have a silver standard, and consequently with Brazil, enjoy the same advantages in their competition with Indian coffee, as China and Japan have in the tea trade.

4. The Madras Chamber of Commerce admits "that Indian Producers will be heavily handicapped in competing with silver-using countries by a fixed 1s 4d rupee; but to attempt to fix a lower standard does not seem to be within the limits of practical politics." It is this prejudice which we would oppose. In our opinion, the true solution of the present difficulty lies in the reopening of the mints. We believe that if this were done a great stimulus would be given to the export trade of the country and capital would be again attracted. The only obstacle, which unfortunately has been allowed to overshadow the whole question, is the loss that would be entailed on the Government of India by its home charges. This, we believe, would be largely compensated by the increased trade and prosperity of the country, but if fresh taxation became necessary to meet the requirements of Government, we, as producers, would prefer to submit to a small direct export tax on our produce than to have to struggle against the recent crushing handicap in favor of produce from silver using countries.—I have the honor to be, sir, your obedient servant,

(Signed) GEORGE ROMILY, chairman, U.P.A.S.I.
Kandy, 14th March, 1898.

A. Ronaldson, Esq., Secretary, United Planters' Association of Southern India, Madras.

DEAR SIR,—In acknowledging receipt of your letters of the 25th and 28th February, and in continuing the correspondence on behalf of the Planters' Association of Ceylon, I have, as regards the first paragraph of your letter of the 31st January 1898, only to confirm my previous communications and to assure the United Planters' Association of Southern India that it can rely on hearty co-operation in whatever combination may be deemed advisable for the purpose of representing to the Imperial Govern-

ernment, the critical condition of the producer's interests in Ceylon and in India, as well as the urgent necessity for action without delay. As Mr. T. N. Christie well remarked in 1893:—"The interests of every class in the colony are wrapped up in its producing interests."

Before dealing with the second paragraph of your letter of the 31st January 1898, it may be convenient and useful if I briefly state what has been done by the Planters' Association of Ceylon, on the subject hitherto. In August 1893, the following resolution passed at a general meeting of the Planters' Association was forwarded to Government:—

Resolution referred to.—"That the Government be urgently requested to take immediate steps to appoint a Commission to consider and report upon (1) the probable effect in Ceylon of the recent action of the Indian Government in putting an artificial value on the rupee; (2) the measures which it may be expedient to take to protect the interests of the colony under the altered nature of the currency, as, in the opinion of the Association, the prosperity of the colony has been seriously endangered."

In reply Government stated that a Commission would be appointed to enquire and report as to the probable effect in Ceylon of the recent action of the Indian Government in restricting the coinage of rupees and the measures which it may be expedient to take to protect the interests of the Colony, in consequence of the altered nature of the currency while Government guarded itself from being understood to express any assent to the opinions expressed in the last paragraph of the resolution quoted above. In this connection attention is also invited to the Marquess of Ripon's despatch, on the subject dated, Downing Street, July 7th 1893, and to the action of the Ceylon Association in London—Sir Arthur Gordon (now Lord Stanmore) addressing a general meeting of the Association said, "The most important subject that has engaged our attention, as it must have engaged the attention of all engaged in Eastern affairs is the great silver question. We now know that Lord Herschell's Committee has made its report, and that the report has been sent out to India for consideration of the authorities of that Country." It is satisfactory to record that several gentlemen representative of Ceylon's producing interests, gave evidence before Lord Herschell's Committee.

The Ceylon Silver currency Commission reported to Government in February 1894, and since then many of the conclusions arrived at by the Commission have been verified and few, if any have been disproved. The Association therefore considers that the Silver Currency Commission's Report 1891 should form an important document on which a case can be prepared to prove the detriment to the producing interests of Ceylon and India caused by the action of the Indian Government in putting an artificial value on the rupee. The Planters' Association proposes to approach the Secretary of State for the Colonies by Memorial, also to secure that a deputation from the Ceylon Association in London shall wait upon him thereon, and will further urge the Governor of Ceylon to write a despatch to the Secretary of State on the subject. As Ceylon has, of course, no *locus standi* with the Secretary of State for India except through the Colonial Office, the Planters' Association may not accordingly be able actually to combine with you, nor perhaps to advocate the precise measures which you suggest, but its action will be contemporaneous, and will have practically the same object in view.

Adverting to the second paragraph of your letter under reply the Planters' Association is in full agreement with the conclusions expressed in paragraphs 14-20 and 24-28 of the Ceylon Silver Currency Commission Report hereto appended for reference, and need only point to the diminished dividends declared by local Tea Companies in 1897-1898 notwithstanding increased crops. That this diminished profit in the tea industry caused, in a large degree, by high exchange has very seriously checked further extensions of tea cultivation admits of no doubt.

It is surely almost unnecessary at this date even to indicate that competition with silver-using countries where the currency is a bullion value, currency will soon be impossible by virtue of the enormous difference between the bullion value and the artificial value of the rupee amounting at the moment to about 60 per cent, and it is incredible that the Indian Government is not well aware of that. It is an unfortunate fact in the case, that the millions of India, who are the chief sufferers, are quite incapable of understanding the cause of their reduced profits and trade, and even if they did have no means of immediately making their voices heard; while the few who are gainers by the high rate of exchange are not only intelligent and educated but are intimately connected with the Government itself, or are sufficiently strong to influence the Government. It is a significant fact that those who without question gain most by a high exchange are European Government Officers, and that those are the strongest advocates of the present policy of the Indian Government in the face of such representations as the producing interests can bring and have brought forward.

It is probably an erroneous assumption that the rupee would ever have fallen to its present bullion value (say 10d), and that if it had, the Indian Government would have been unable to meet its liabilities and it is probably correct that if the mints were reopened there would be an immediate rise in the price of silver, and therefore of the bullion value of the rupee. Again had the Indian Government by its action not so severely crippled all the producing industries of its country, the population would have been in a condition to bear some additional taxation, indirectly, perhaps by means of an export tax.

All are agreed that cheap capital is absolutely necessary to develop the resources of Ceylon as of India and that staple exchange will tend to attract capital. Capital however seeks profits not stability of exchange alone and where here are no profits capital will not flow. Moreover the high rate of exchange induces the withdrawal of capital to London and hinders its return to India for the simple reasons that *with diminished or no profits there may also be loss of capital* in getting it back again. Capital will inevitably flow where there is most profit and prosperity, but apart from this, stability of exchange is just one of those objects of the policy of the Indian Government which it has certain not attained.

One of the worst features of the case is that the Indian Government by its action has rendered remedial steps exceedingly difficult. Having paralysed the producing industries, an export tax must temporarily be severely felt. Having closed the mints and raised the price of the rupee as well as depressed the value of silver, it is difficult, if not impossible, to reopen the mints without inflicting enormous loss on holders of merchandise for the time being.

In conclusion the Association would draw your attention to the report of Mr. David Yule's speech at the meeting of the Calcutta Bank, January 26th, which commends itself as an able exposition of the case from the producer's point of view.

Mr. Yule among other matters, emphasis the want of confidence that prevails, and how essential it is to establish confidence. When confidence is established the Planters' Association agrees in believing that capital would again flow freely to Ceylon and India, that probably the only sensible remedy to the present unfortunate position of India and Ceylon is to gradually to re-open the mints to the coinage of silver under certain conditions. In view of the different conditions prevailing in Ceylon, and that this Colony should not be involved in the same financial disaster as the Indian Government were the rupee to fall to its intrinsic value the Association would not be prepared to join in a request for the imposition of an export duty on produce.—I am, dear sir, yours faithfully,

A. PHILIP,

Secretary to the Planters' Association of Ceylon.

TEA FACTORIES AND SITES.

SIR,—Will any of your experienced correspondents favour me with replies to the following questions :—

1. What amounts have been spent on excavating sites for tea factories ?
 2. Would the bottom of a valley prove an unfavourable site for a tea factory as respects the withering of the leaf ?
 3. Would it be wiser to incur extra expenditure on securing a site upon an open hill side rather than choose a site down in a valley ?
- Yours faithfully,

AN INDIAN PLANTER.

[The first consideration, in regard to a factory site, is what power can be utilized—if “water-power” from a river and this can best be done by occupying a position near its banks, everything else gives way to this all-important consideration. We know of a first-class factory, turning out good teas, which has its factory at the bottom of a valley for the sake of the turbine driven from the river and which gets good ‘withers’ and makes good tea. But then the circumstances of Indian tea districts, in respect of climate and sunshine, [may differ much from Ceylon.—ED. T.A.]

CEYLON TEA INDUSTRY.

(By an ex-Ceylon Colonist.)

LONDON, March 4.

What is coming over our

TEA INDUSTRY ?

Only 18 months ago tea was being boomed in the city ; and today men are shaking their heads, prophesying all manner of evil things and “refusing to be comforted.” Shares are practically unsaleable and the average price of tea goes steadily down. The reports of our different Companies are not pleasant reading. They all account for reduced profits by referring to the rice famine and the high exchange. No doubt, these are important factors ; but I think they only partially explain the unfortunate position. The average price of tea is going down and those who are in the trade complain bitterly of the poor stuff that is now being shipped to Mincing Lane. The fact is that Ceylon is losing its good name and I think there can be no question that quality has been sacrificed for quantity. The temptation to show big yields and so assist the flotation of Companies at fancy prices has been too great, and now that these Companies are floated they must keep up the big yield to support the prospectus. What chance has quality in the competition ? But to my mind the most serious factor in the whole situation is the statement now being made very freely in the city that tea has been “cornered,” and that the produce is now in the hands of a few men who can practically control in the market. I believe I am right in saying that Lipton, Mazzawate Co., Brooke, Bond & Co., and the Wholesale Co-operative Co. are practically today able to regulate the price of tea. The unfortunate thing about this combination, from Ceylon’s point of view, is that it exists not to *keep up* but to *depress* the price of the article dealt in. When these Companies are buyers something like fair price may be realised, but if they agree at any sale to withdraw, the market collapses. The tea sale

this week is the worst on record and men, usually sanguine, confess that the outlook is depressing. I do not wish to exaggerate the importance of Lipton, but my opinion is that he is primarily the cause of the present disturbed state of the tea market. The “largest dealer in the Kingdom” had to break all known prices ; others in the trade entered into competition to save themselves and the demand was for cheap tea. One of the Companies mentioned above is now selling packet tea at 10d per lb. to compete with Lipton’s at 1s per lb. Sorry I cannot write more but the mail is just closing.

[The above may explain the Calcutta telegram contradicting any “corner.” Should such arise, planters will have to form Syndicates to get directly at consumers.—ED. T.A.]

PLANTING NOTES.

TEA PLANTING IN BOGAWANTALAWA-BALANGODA DIVISION.—A recent visitor passing from Dikoya to Balangoda remarks on the evidence of progress at the junction of the two districts :—“I have found a great change in this part of the country since last here. Before, Detenagalla was the first tea you saw after the gap ; now the whole head of the valley, which used to be ‘chena,’ is planted up, and as the soil and the ‘jhat’ are both good, it seems likely to be a good investment.”

INDIAN TEA.—The total shipments to all places, from 1st April 1897 to 31st January 1898, amounted to 141,678,418 lb., of which Great Britain alone took 130,419,051 lb., leaving less than 8 million pounds for consumption in India, which is a curious commentary on the exigencies of trade. The country producing the tea, with a population of 300 million souls, is unable to consume more than 8 million pounds of its own product. Not that the Aryan does not appreciate the value of tea, indeed he is fully alive to its merits, but it will require great efforts to penetrate his conservatism. The question of price is an important factor with him, and until he can get his *chah* by the price, it is doubtful whether he will become an extensive consumer.—*I.P. Gazette.*

IN CENTRAL AFRICA.—A former coffee planter in Mysore writes to a friend in Ceylon describing his experience. A contemporary gives the letter, and from it we take the following extract :—“Since leaving six months ago I have not met half dozen Europeans and the Government Collectors. I have been in places and whole districts where no white man has ever been, and only on one or two occasions I have been badly received. Generally the Chief has turned out and given me his house. Where I have been badly received I have left an everlasting impression on the villagers. I have been buying ivory in exchange for calico, but have not made much out of that, but now I have taken up 2,500 acres of some of the best land in the world for coffee planting and have staked work in earnest. As a byplay I have over 700 men gathering Indianrubber, who bring me in over half a ton a week, and I hope to double that amount of men in a couple of months. I started with the idea of settling at least not within 100 miles of another planter and so I have, for my nearest neighbours are 600 miles away and yet my transport is just as easy as theirs. I am about ten miles from the lake shore and can send down goods by the lake into the Shire river and thence down the Zambezi to the sea. English coinage is of no value here.”

AGRICULTURAL SHOWS IN CEYLON.

The following leaf from the past will be read with interest just at this juncture when Agricultural Shows are in the air :—

List of Prizes awarded by the Agricultural Society (of Ceylon) on March 31st, 1845 :—

No.	Description of Articles.	Amount.	Names.
1	Best 4 year old coast bull..	10	Mr. Tytler
2	2nd best do ..	4	do
3	Best cow ..	5	Mr. J. W. Little
4	Best yearling bull ..	2	Jayavilleks Mud.
5	Best 3 year old bull (mixed breed) ..	10	Mr. Tytler
6	2nd do 3½ year old ..	4	Mr. W. Austin
7	Best heifer (mixed breed)..	3	Mr. Gerard
8	Best native breed cow ..	2	do
9	Best fattened bullock (any kind) ..	3	Mr. Tytler
10	2nd best do ..	2	do
11	A coast bull ..	2	Capt. Jolly
12	Best imported English cow ..	5	Mr. Lindsay
13	Best mule ..	5	Mr. Young
14	Best 3 year old jungle pony ..	3	Tikiri Banda
15	Best sow ..	1	Mr. Hamilton
16	Best bouquet of flowers ..	1	Mrs. Delegal
17	Fine sample of Pervian cotton ..	5	Mr. Robbe
18	do. silk from Dumbara..	10	Dr. Hewlett
19	Sample of 500 bush Indian corn ..	2	Mr. D. A. Watt
20	Two pumpkins ..	1*	Tikiri Banda
21	A very large bunch of plantains ..	¼	Mr. H. Steuart
22	Best cabbage and pease ..	¼	Mr. C. Buller
23	A pair of fine rabbits ..	¼	Mr. E. R. Power
24	A pair of black fowls ..	¼	Mr. Tytler
25	For Mr. Guthrie's improvement on the pulper ..	20	—
26	Specimens of tiles and bricks ..	1	—

* 5s. Total £101¼

A NEW WAY WITH DIRECTORS.

In these days we are told that it is rather difficult to catch hold of a Director of a local Tea Company. So many of the Companies have done badly, that, perhaps, it is not to be wondered at, that, rather than face the heated inquiries of disappointed shareholders, Directors should be content to "hide their diminished heads" and be as difficult to find as a profit to divide, or a prophet who can foresee, to any real purpose! Still it is in these times that really good men are expected to hold on to the helm, and the good man has always his worth. Directors' fees which, in prosperous days, float in so agreeably and at so slight a cost, are now approximating to Dead Sea apples; and the more sensitive a man is, the less does he like taking fees from a hungry and starved body of shareholders, who can "bill and coo" in the golden harvest days, but get nasty in "the winter of their discontent."

The London *Spectator* commenting on the "Grosvenor Hotel Case" suggests that "the Directors' reward can be made to depend upon what they are able to earn for the shareholders. The fee should be abolished, and a commission dependent on and proportionate to profits actually earned be substituted in its place." A capital idea if it could be carried out; but we fear that if today a Director of a local Tea Company is difficult to catch, he could not be found at all if the terms suggested by the *Spectator* were to obtain amongst us! Yet a fee proportionate to profits would give less offence than a fixed sum for all time, and, besides it should stimulate to good directorial work; and moreover would it not lead to a greatly diminished risk of unprofitable, non-paying Companies being started if the Directors—namely the promoters—had no prospects save through a commis-

sion on profits? Here are the *Spectator's* remarks at fuller length.—

We all know how under existing conditions the work of a Director, which is really of the most onerous and responsible kind, has come to be regarded as a kind of honorary or titular distinction whereby a man, often through doubtful intrigues, makes an income without doing any work. At the meetings of the Directors he signs the book and takes his fee, and that is about all he does. To "direct"—i.e., to act for the Company as the individual business man of an earlier stage acted for himself—to check accounts, to examine prices, to determine on orders and sales, to prevent leakage, all this is beyond his intention, perhaps beyond his capacity. We fully admit that no legislation, however stringent, can ultimately protect shareholders from dishonesty or incapacity on the part of Directors. But at least this can be done,—Directors' reward can be made to depend upon what he is about to earn for the shareholders. The fee should be abolished, and a commission dependent on and proportionate to profits actually earned, be substituted in its place. The great object, it cannot be too often repeated, is to compel the Director to direct, to make of him a real business-agent instead of a mere figure-head, an ornament, or, as in the case of the Grosvenor Hotel Company, a mere tool of a profit-seeking man. The Grosvenor Directors knew that their attendance fees were secure, and they cared for nothing else; the interests of the big hotel and of those who owned it were indifferent matters to these men of straw. The Directors must be interested in the enterprise, and their reward must be dependent on their exertions in behalf of their clients, the shareholders: that at least is certain if we are to relieve the Company system from the odium and the suspicion which, after this extraordinary case, must be held to attach to it. For the responsible managers of a commercial undertaking to pocket their rewards and shut their eyes to overcharges is intolerable. It is the idle and irresponsible Director who is at present the weakest spot in the modern business system.

THE GOVERNOR'S TRIP IN THE EASTERN PROVINCE:

PROGRESS OF AGRICULTURE: FRESH COCONUT LAND.

(Communicated.)

THE Governor's visit to the Eastern Province passed off very satisfactorily, and he took great pains to make himself thoroughly acquainted with its capabilities and wants. He was much impressed with the magnitude that the paddy and coconut cultivation had attained and the industrial character of the agricultural classes. Three or four important measures that were laid before His Excellency for the further development of the Province will receive his immediate attention.

As regards Coconut cultivation there will soon be advertised for sale some excellent land near the sea-coast towards the south. Capitalists will do well to invest as they will have the opportunity of buying large blocks all together if they wish it. Coconut cultivation is the thing of the future.

"RAMIE: ITS CULTIVATION, DECORATION, TREATMENT AND USES,"

Is the title of a pamphlet just issued by Messrs. MacDonald Boyle & Co., of which a copy has been sent to us from home, and from which we quote some practical paragraphs as follows:—

In an Estate of, say 1,200 acres, we advocate the laying out of 8-acre blocks—two acres of which under cultivation, and the remaining acre, is devoted to paths

—one coolie can attend to each block, as when once started he has only to cut a daily supply of stems; no cultivation being necessary, beyond returning to the land, the refuse consisting of the leaves (which are stripped off on the spot as each stem is cut) and the ashes from the burnt refuse from the Decorticators; the daily cuttings, assuming a crop of 70 tons of stems, per annum, per acre, would be about nine hundred-weights for each two acres. Assuming the stems to mature in three months the block would be planted in twelve sections occupying twelve weeks, and by the time the last section is planted, the first should be ready for cutting. Each section, will require weeding, until the stems have arrived at about 2 feet high, after that, no weeding will be necessary, as no weeds can grow in the neighbourhood of Ramie, after the plant has arrived at that height.

If regularly cut, the plants will continue to grow for an indefinite period, but in consequence of the spread of the roots they will require periodical thinning out—removing every other one for instance—care being taken to have other land ready to transplant the roots so as to prevent waste. Irrespective of other considerations, the system of daily cuttings is important, inasmuch as only ripe stems are cut, and a uniform quality of fibre assured, whereas by the crop system, ripe, over-ripe, and immature stalks are cut indiscriminately, thus preventing any possibility of uniformity in the fibre.

In order to select suitable land for the cultivation of Ramie it is necessary to understand the chemical constituents of the plant, these having been found by careful analysis of the incinerated green plants to be as follows:—

Potash	11.8
Soda	2.35
Lime	30.87
Magnesia	7.89
Ferric Oxide and Alumina	2.41
Oxide of Magnesia	0.17
Phosphoric Acid	7.29
Silica	33.01
Chlorine	2.43
			100.5
Less excess of Oxygen due to Chlorine			0.5
			100.0

From the above analysis it would appear that the Ramie plant exhausts the soil, but inasmuch as the whole of the refuse from the decorticators (consisting of bark and wood, and the whole of the leaves) is returned to the soil, there remains simply the fibre which is only 2½ per cent. of the weight of the stems without leaves—under these conditions the exhaustion is more apparent than real.

From experiments undertaken by the United States Agricultural Bureau, the Mineral ingredients extracted from the soil were found to be distributed over the whole plant as follows:—Of Potash about three-fifths in the stalk, more than one-fourth in the leaves, while the bark and fibre contain a little above one-tenth. Of the Lime 87 per cent. was in the leaves, 10 per cent. in the stalk, and 3 per cent. in the bark. 55 per cent. of the Nitrogen was found in the leaves, 29 per cent. in the stalks, and 15 per cent. only in the bark. So that all that is actually taken from the soil is an infinitesimal amount of the Potash which is contained in the fibre.

In the choice of the land therefore it is necessary to ascertain the quantity of the above ingredients it contains. A soil not too heavy should be selected, and be well but not too deeply drained, as the plant is a surface feeder; it grows better in the shade; in clearing jungle, therefore, many of the large trees may be left standing.

METHOD OF CULTIVATION—When sufficiently cleared the land should be laid out in blocks of three acres, to which one coolie can attend, as all he has to do after the plants are two feet high is to cut the stems as they ripen and deliver them to the tram line. For the convenience of transport the tram should run through the centre of each block, so that the farthest

point to which he will have to carry the stems should not be more than 250 yards, that is, he will have one and a-half acres on each side of the line, the length of each block being roughly 250 yards; the three acres should be laid out in beds, 6 feet wide, with a pathway between of 3 feet. This will give two acres actually under cultivation. The beds should be turned over about 9 inches deep, and the earth from the paths (which should be about 18 inches below the level of the beds, to carry off the heavy rains into the drains), thrown on to them, and smoothed over. They are then ready for planting.

PLANTING.—If sufficient plants already exist in the neighbourhood, an estate may be started with cuttings, rooted layerings, or by means of the divided roots. If no plants exist recourse will have to be had to seed.

CULTIVATION FROM SEED: Sowing.—A piece of any light soil, is well dug once or twice, then divided into small beds, say six feet by four feet, the surface is pressed down with the back of a spade and made moderately firm, and then raked smooth. The evening before the seed is to be sown the beds are watered, the following morning they are likely raked and levelled. The seed, which is very small, is mixed intimately with dry earth, say one pint of seed with twelve pints of earth, which is sufficient for six beds of the size named. This mixture is sown evenly over the beds (not covered with earth) and then lightly pressed down with the back of a spade. Light thin mats are stretched on sticks about two feet above each bed, to keep them sufficiently moist, and to protect the germinating seeds from the sun. No water is given till the young plants are up, but if necessary, the shading mats are sprinkled by means of a broom dipped in water. The mats are removed at night, so that the young plants may catch the dew, and they are laid aside altogether when the plants are two inches high. If the beds are dry they are now watered, and this is repeated whenever necessary. The beds should be kept clear of weeds. As soon as the plants are big enough to handle, and before they become crowded, they are transplanted to the field—a wet day being chosen for the purpose; they are taken up with a spade, keeping a small ball of earth round the roots of each, and planted about nine inches apart. The beds should be kept weeded, until the plants are 2 feet high, when no further attention is necessary.

PLANTING ROOTS.—When the plantation is started by roots, they should be planted 18 inches apart.

LAYERINGS.—The plants can be propagated by means of layering either from the seedling or the root; when the plants are grown for the special purpose of propagation, they should be arranged three or four feet apart, set slantingly, two or three inches of earth covering the tops. The ground must be kept clean and loose. When the first stalks have attained the height of about three feet, they are ready for layering. The ground then should be thoroughly moistened, and the stalks bent gently down, fastened with small crotchets, and covered with three or four inches of earth, leaving the top of the layered stalk uncovered. Care should be taken to avoid detaching the stalks from the parent root. In the course of three or four weeks the layers will have made stalks, which can again be layered for the same purpose, and quite a number of the stalks can be dug out for transplanting in order to increase the plantation.

CUTTINGS.—These are prepared by dividing the stalks into lengths of five or six inches. They are set out obliquely, about twelve inches apart, and nearly covered with earth, and if the work is done before the hot weather begins, they will require neither watering nor shading, but must be kept clean of weeds. In two weeks they will have rooted.

TRANSPLANTING.—In time the entire space between the rows will have become filled with roots unless precaution is taken to remove every alternate plant as soon as the rows become overcrowded, but care should be taken to have other land ready for receiving the transplanted roots.

EVEN GROWTH.—The matter of securing an even growth of stalk is a very important consideration; by even growth is meant not only even length and size of stalk, but uniformity of growth. A stem of

Ramie grows rapidly when there is sufficient moisture, but is stunted and slow growth when opposite conditions prevail. When one of these conditions follows the other in the same growing crop the fibre is adversely affected, for in the after-process, to fit it for spinning, the chemical treatment, necessary to reduce the hard and stunted growth, to the condition of spinable fibre, may wholly disintegrate the structure of the fibre, in the softer or free grown portion of the stalk, and great waste and loss ensue. Therefore, where lengthened droughts are likely to occur, means of irrigation must be provided.

Crop.—One acre of land should produce at least 70 tons of stems (stripped from leaves) per acre. This means that each coolie will have to cut and bundle, on his two acres under cultivation, about 9 cwt. of stems (weighing say 6 ounces each) per day, and reckoning 313 working days to the year.

DECORTICATION.—After cutting, the next operation is to decorticate the stems and separate the fibre. One battery of decorticators will treat the produce of 200 acres. This battery is placed in the centre of each 200 acre block, so as to minimise the transport of the stems.

DEGUMMING.—The fibre produced by the decorticators, is embedded in a mass of gum, and resinous matter, insoluble in water, which must be removed before the white filasse suitable for textile purposes, can be obtained. It has therefore to be sent to the degumming shed, where by means of a chemical process, the cleaning is effected, and a beautiful white fibre obtained; it is then dried and packed for export.

An estimate of Plant and Machinery to treat the produce of 400 acres under cultivation, amounts to £3,050.

This plant will produce about two tons of Filasse per day. The estimate does not include the cost of erection, which will naturally vary, according to the situation of the estate, and the labour available.

Estimate of Cost of necessary Machinery for treating the product of 1,000 acres—is

PLANT AND MACHINERY.		£.	s.	d.
Decorticators, 5 Installations of	40 Drums, with 5 12-h.p. Engines	3,000	0	0
One Degumming Plant	..	1,000	0	0
Steam Boilers and Engine	..	1,000	0	0
Soaking Tanks	..	250	0	0
Chemical Tanks	..	250	0	0
Water Tanks	..	100	0	0
Steam Pump and Appliances	..	100	0	0
Loading Crane, Weighing Machinery, &c.	..	500	0	0
Fittings for Treating Sheds	..	250	0	0
Steam Barrel, Steam Valves and Fittings	..	150	0	0
Belting	.. say	100	0	0
Baling Machinery	..	500	0	0
Freight and Squadies	.. say	350	0	0
		7,550	0	0

The above machinery will produce 7½ tons per day of cleaned filasse. This estimate does not include fitting and fixing, for the reasons stated above.

TABLE OF COST, INCLUDING FREIGHT, &c.

Assuming the product to be one-and-a-half tons per acre per annum on 1,000 acres, the following table will show at a glance, approximately, the price of each ton Filasse according to the cost of labour, the other figures remaining constant.

No.	Wages per day.			Cutting.			Decortication.			Degumming, including Chemicals.			Freight, including Wrapping for Bales.			Brokerage and Landing Charges.			Total Cost per Ton.		
	£.	s.	d.	£.	s.	d.	£.	s.	d.	£.	s.	d.	£.	s.	d.	£.	s.	d.	£.	s.	d.
0	0	3	0	0	0	0	0	0	0	0	0	0	0	0	0	0	16	10	8	14	3
0	6	0	0	1	13	0	1	1	0	0	0	0	0	0	0	0	16	10	11	1	4
1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	13	10	15	15	6
1	6	0	0	17	1	4	17	5	4	0	7	0	0	0	0	0	16	10	20	9	10

The Brokerage and Landing Charges have been taken at the sale price of £42 per ton, which sum the Filasse will readily obtain in the English Market. If a higher price is secured, of course this item will be increased.

TERMS.—The above Machinery is supplied on condition that 25 per cent of the net profits is paid to Messrs. Macdonald, Boyle & Co. by way of royalty, and in all cases, before the machinery is supplied, the purchasers will have to enter into a contract to that effect. One third cash is payable with the order, and the balance when the machinery is packed ready for export.

The local Agents Messrs. Lee Hedges & Co., advertise that they are ready to supply copies of the pamphlet.

INDIAN PATENTS.

APPLICATIONS FOR THE UNDER SPECIFIED INVENTIONS HAVE BEEN MADE.

12th February, 1898.

No. 45.—G. F. M. Horbury, M. Inst. C.E., Bombay, for an improved latrine for natives.

No. 47.—J. S. E. Lumsden, office of Accountant General, Military Department, for an automatic machine for pulling punkhas.

No. 48.—Khetter Mohun Kurmoker, of Alipore, and Annada Prasad Mukerji, of Kidderpore, for an improved motor for actuating punkhas and other similar purposes, to be called a "powerball."

No. 49.—J. L. Spoor, Madras, for the manufacture of cement.

No. 50.—Charles James Dear, of London, for an improved machine for the breaking, scutching, decorticating and like treatment of ramie and other fibrous plants.

No. 55.—Dosabhai Khurshedji Eadan, Bombay, for an improved machine for extracting fibres.

No. 56.—John James Mursland, Bombay, for an improved latrine seat for the use of natives of India, to be called "the Aryan latrine seat."

19th February, 1898.

No. 64.—John Kiel Tulis, of Glasgow, for improvements in treating hides and skins.

No. 66.—John McDonnell, Ceylon, for improvements in apparatus for keeping tea-leaf cool during the process of rolling by machinery.

26th February, 1898.

No. 71.—William Martin, Agra, N.-W. P., for a combined plough suitable for ryots in India.

4th March, 1898.

No. 79.—Heinrich Ludwig Verwohlt, of Java, for improvements in and relating to machines for the treatment of Liberia coffee beans.—*Indian and Eastern Engineer.*

"THE AGRICULTURAL GAZETTE" of New South Wales. Volume IX. Part 2. For February, 1898, has the following contents:—The Making and Improvement of Wheats for Australian Conditions; The Economic Feeding of Working Horses; Bacteriology in Relation to Dairying, (with a contrast between European and Australian methods); Notes on Pests and Crops; Some Tools useful in Experiment Work; Fruits at Wollongbar Experiment Farm; The Australasian Fruit Case; Breeding and Rearing Ducks; The Causes of Bloating and Frogging in Trees; Plans and Specifications of a small Circular Saw; Bees, and How to Manage them—II; Bee Calendar for March; Orchard Notes for March; Practical Vegetable and Flowers Notes for March; General Notes; Replies to Correspondents; List of Shows for 1898; Label for Specimens.

MACHINE-MADE TEA IN CHINA

A TRADE REVOLUTION.

SHANGHAI, March 3rd.—It is certain that very great interest will be taken in the modest prospectus of the Liang Hu Tea Improvement Company, which appears in our front page this morning. The Russians only remain faithful to China Congou, and the British public, the greatest tea-drinkers in the world, will not have China Congou any more, preferring the machine-made tea of India and Ceylon; and thus what was a magnificent trade has dwindled away to a shadow. But the leaf grown in China is still the best in the world, all the plants that produce decent tea in India and Ceylon having been introduced there from China; the trouble is in the mode of preparation. Three or four men have been working for some years to get the Chinese to adopt the modern system of manufacturing tea. The manufacture has been adopted successfully on a small scale at Foochow, and experiments made at Wenchow last year with very inferior leaf opened the eyes of the Chinese as to how by the use of machinery they may regain the market they have lost. Now the tea-men of Hankow and the high officials of the great black tea producing provinces, Hupeh and Hunan, have been interested in the matter, seeing that a recovery of the English market means wealth to themselves, as well as to the growers and the foreign merchants who handle the packed product. A Company, modest enough in its inception, has been formed at Hankow with a capital of Tls. 60,000 and Shanghai is also appealed to for its co-operation. The Chief Director is Mr. R. B. Moorhead, Commissioner of Customs at Hankow, and we understand that this appointment is particularly favoured by the Viceroy at Wuchang, under whose protection we may say the company is formed. The provisional directorate is a very strong one. Mr. Chi Ching-foo is the compradore of the Hongkong and Shanghai Bank here. Mr. Tang Kew-ching is familiar to all who have anything to do with tea as *Awal*, and his name is a synonym for enterprise, intelligence, and uprightness. Mr. Tang Soey-chie is the head of the leading tea hong at Hankow and compradore to Messrs. Molchanoff, Pechatnoff, & Co; while Mr. Chun Fai-ting, the able and courteous Manager of the China Merchants' Steam Navigation Company in Shanghai, needs no introduction or commendation. A significant paragraph in the prospectus is that which says that "although this is a purely mercantile company, Mr. Moorhead has received the guarantee of the Viceroy of the Liang Hu provinces that the machinery and employes shall be fully protected", and still more significant is the statement that "no officials will be directors or in the employ of the company." The confidence that is justly reposed in the Hankow Commissioner, Mr. Moorhead, by Chinese and foreigners alike, is shown in the provision in the prospectus that the "Chief Director is to have full power in the direction of the company and in the engagement of all employes of the company; he is also to have power to delegate his authority temporarily to any respectable and trustworthy foreigner, whom he believes capable of performing his duties during his temporary absence, but he is to be accountable for the acts of his delegate."

It cannot be doubted that in this small beginning we have the germ of a revolution in the preparation of tea in China, and a resurrection of the trade between Hankow and London, which is dead if not actually buried. The first tea-leaf rolling machine for the company is on board the "Oaufa" and will be landed in a few days. A commencement of operations will be made this year in Yanglaotung district. It is not our province to recommend public companies to our readers; but the establishment of the Liang Hu Tea Improvement Company means a great deal more than the provision of a remunerative investment; it means the recovery of a great trade that has been lost, and, it was thought irretrievably lost. There is no question that China, by adopting Indian methods of preparation, can compete,

with India, and on still better terms if India adopts, as it is said she is going to do, the gold standard.—*N. C. Herald.*

CARE OF HORSES.

It is speed that kills, overloading that breaks down and ruins.

A rough, soft or sandy road, nearly or quite doubles the labour of a horse, and a head-wind adds greatly to it. A rise in the grade of one foot in ten doubles the draft. Dry axles double the labour and weariness of the team.

Overloading is costly and cruel, and has ruined thousands of horses. No load should be too heavy to haul easily over the hardest place on the strip. Steady hard pulling causes great pain, so a team should have frequent rests, especially during the early part of a trip.

Much horse power and distress is saved by starting slowly and driving moderately the first hour. Never start fast.

Balking is caused by overloading whipping, cold or ill-fitting collars or harness, and ugly drivers. It is cruel and useless to whip a balky horse. Turn his attention; tie a string rather tightly around his leg or his ear, lift his foot and pound on the shoe, give him sugar or an apple, but do not hurt him. Rarey says, "horses never balk until forced into it by bad management."

Hard worked horses should have hay on the floor at night so that they may eat while lying down.

Plaster scattered on the stable floor keeps down bad odour and purifies the air.

To protect horses and cows from flies rub them with a cloth dam, *not wet*, with kerosene. It helps greatly. A decoction of walnut leaves is said to be very effective.

The feet should be examined every night and stones removed, as standing on them causes suffering and lameness.

It is cruel and impolitic to tie a horse so that he cannot lie down. Horses should have deep, soft bedding, night and day, especially hard worked ones.

Horses need water as often as men—or oftener. It is better to give them water five or six times daily than let them drink rarely and heavily.

Regularity of meals and variety of food are as important to horses as to men. Water horses before feeding them, or keep water within their reach.

The horse having a very small stomach does better on three meals a day than on two, and should not have an unlimited supply of hay. He is much like a man and needs very similar treatment.

Horses over twelve years old often suffer from tooth-ache, which prevents mastication and causes poor condition. Every horse should be examined annually by a veterinary dentist. It *pays*.

Horses need a variety of food. It pays to give them vegetables, a few apples, &c., also fresh grass, all moderately. Every horse should have a box of salt within his reach, also a pail of water, especially at night.—*Home paper.*

MINOR PRODUCTS.

London, March 5.

COCA-LEAVES.—At the drug-auctions today fair green Truxillo leaves were limited at 6d per lb., and broken at 5d. A parcel of 11 bales fair Ceylon was brought in at 4l. The export from Java for the six months ending—

Year	.. 1894	1895	1896	1897
Bales	.. 369	619	560	598

CROTON SEED.—Two parcels consisting of 29 bags has come to hand from Colombo, but were not in time to be offered at today's auctions.

OIL CHALMUGRA.—Good pale sold at 1s 5d per lb.

OIL, CINNAMON.—Two parcels of "cinnamon-leaf" oil were bought in at 41 per oz. The exports from Ceylon from January 1 to February 8 were 17,375 oz.

OIL, CITRONELLA, sold, with good competition, at 1s 0³/₄ to 1s 0¹/₂ per lb. It was bright yellow to green oil, put up without reserve, 159,291 lb. were shipped from Ceylon from January 1 to February 8, of which 76,949 lb. went direct to America and 77,331 lb. to the United Kingdom.

VANILLA.—In small supply. A few lots sold, fair chocolate 5 to 6¹/₂ inches, 17s to 18s medium brownish at 15s. A few lots split Mauritius 6 to 6¹/₂ inches sold at 15s mouldy Tahiti brought 3s 5d per lb.

CINCHONA.—At the sales in Amsterdam last week less than half of the bark offered was disposed of. The sales made at the respective units were as follows (in quinine-sulphate equivalents):—

5c	5 ¹ / ₂ c	5 ¹ / ₄ c	5 ¹ / ₂ c	6c
522	1,426	2,354	2,445	1,094 kilos.

The following is a statement of the quantities and descriptions of bark offered:—

—Chemist and Druggist, March 5.

A COCONUT PALM CATERPILLAR.

[The following paper by Mr. E. Ernest Green, Honorary Government Entomologist, on the disease of Coconut Palms, is published by Government for general information.—E.D. T.A.]

"THE BLACK-HEADED COCONUT CATERPILLAR."

DESCRIPTION OF INJURY.—The first indication of the pest is the withering of the palm leaves, only the very young leaves at the top of the tree remaining green. The disease rapidly spreads over a large area. The withered leaves droop and eventually fall off. Old trees and young plants suffer equally. Nuts and young plants in nurseries do not escape. Upon the under-surface of the injured leaves will be found an accumulation of what looks like saw-dust mingled with web. This has been formed by the caterpillars for the purpose of concealment, and they live and feed beneath this covering. All the green parts of the leaf are eaten away from below, leaving only the hard skin of the upper surface and the tough fibres. The husks of the young nuts are also sometimes attacked and the outer green skin eaten off. Gummy matter oozes out from the wounded parts of the nut and dries into hard reddish lumps. Such extensive injury to the leaves weakens the trees, resulting sometimes in a loss of more than 50 per cent. of the crop, and reducing the bearing capacity of the trees for two or three years.

HISTORY OF THE PEST.—It appears, from reference to old estate diaries, that the pest has been known in parts of the Batticaloa District for the last thirty years, sometimes breaking out with great virulence, and at other times disappearing altogether. The late Mr. H. Nevill, C.S.S., reported that the caterpillars were destroying the leaves and seriously injuring the trees over acres of coconut estates at Batticaloa in September, 1896. Mr. Nevill remarked, at the same time, that the pest was not known on the Jaffna estates. The pest appears to be at its height in the months of September and October, and to disappear with the advent of the heavy rains of the north east monsoon.

DESCRIPTION OF THE INSECT.—The caterpillar is small, scarcely more than half an inch long when fullgrown. The skin is smooth, with only a few very fine inconspicuous hairs. The head and next two divisions of the body are black and shining, the rest of the body is cream-coloured with minute brownish specks and lines. The parts immediately behind the head are considerably broader than the rest of the body.

The chrysalis (pupa) is shining reddish brown, and enclosed in an irregular cocoon amongst the old webs formed by the caterpillars.

The moth (which probably emerges in about fifteen days' time) is of a pale slaty-gray or yellowish gray colour, the front wings speckled with black. The expanded wings measure ¹/₂ inch from tip to tip. The eggs have not at present been observed. They are probably deposited in clusters upon the young leaves of the palm.

REMEDIAL MEASURES.—It is reported that the usual remedy now employed is to burn the fallen leaves and other rubbish with a sprinkling of sulphur over all. The smoke is supposed to kill the insects. Mr. Munro, one of the pioneers of coconut planting in the district, informs the Government Agent, Batticaloa, that his estate suffered severely at one time, but by dint of constant fumigating the pest has disappeared altogether, and has shown no symptoms of returning. His mode of procedure was to collect large heaps of rubbish and burn them in dry weather during the prevalence of high wind, which drove the smoke through the whole estate. The middle of the day was also selected as the best time, when the moths and caterpillars were not protected by a covering of dew or moisture of any kind. This was kept up for some days till the pest disappeared.

It is improbable that the smoke—or even the fumes of sulphur burned in the open air—would actually kill the insects. But the constant smoke may very possibly make the neighbourhood so unpleasant that the moths are driven away to other parts before laying their eggs. And consequently no fresh broods would appear on the protected estates.

The burning of the fallen leaves is to be recommended also for the reason that many of the pupæ of the insects may be destroyed by this means. Before the fall of the old leaves, however, the active caterpillars will have crawled on to fresh leaves. It would therefore be strongly advisable to cut off the injured leaves while the insects are still feeding upon them and to burn these with the rubbish. If carefully carried out at the commencement of an attack, this treatment would probably of itself be sufficient to keep the pest in check and to prevent it from spreading further.

Any attempt to kill the insects upon the growing leaves by means of insecticides is quite impracticable, except upon very young trees and upon plants in nurseries. Even in such cases, when the pest is once established, it would be difficult to reach the caterpillars by spraying, owing to their habit of secreting themselves and feeding beneath a dense web. But young trees and nursery plants at present unaffected by the pest, and even the nuts upon the older trees, might be protected by the use of a wash containing arsenic mixed with some soapy medium. This would make the leaves distasteful and poisonous to the caterpillars.

The burning of rubbish and weeds, with or without the addition of sulphur, in unaffected plantations might also prove of protective value. The smoke, if dense, would tend to keep away the moths that are migrating from neighbouring affected fields.

A careful watch should be kept for the first appearance of the pest, and every effort should be made to check it before it has become widespread.

E. ERNEST GREEN,
Honorary Government Entomologist
February 24th, 1898.

DEAFNESS. An essay describing a really genuine Cure for Deafness. Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON.

PLANTING NOTES.

PLANTING IN THE NILGIRIS.—A recent visitor reports:—"The *Coffee* in the Nilgiris looked grand and a fine blossom was just coming out, but the *Tea* is mostly China. The shops were advertising Darjiling Teas at R2 per lb."

AMMONIA SULPHATE.—The report of the Deutsche Ammonia Verkaufs Vereinigung for 1897 shows that during that year they sold in England 2150,000 tons of ammonia sulphate, in Germany 100,000 tons, in France 30,000 tons, in Belgium and the Netherlands 30,000 tons—altogether 375,000 tons, or 40,000 more than in 1896.—*Chemist and Druggist*.

A COCONUT PALM CATERPILLAR.—The Government has just sent to the press a very useful memorandum on a coconut pest from the Honorary Entomologist, Mr. Green, which we reproduce on page 721 with the intention of at once including it in our current manual "All About the Coconut Palm." We have not heard much of the caterpillar on the Western side of the island; but to be forewarned is to be forearmed; and Mr. Green states very clearly what ought to be done where its presence is detected.

CEYLON GEMS.—At a recent meeting of the Royal Society of New South Wales, Prof. Liversidge exhibited some mineral specimens. Amongst them was, says a home paper, a sapphire from Ceylon, which is of a fairly deep red or amethyst tint by candle or gas light, but of a blue colour by day-light, by the electric light and by magnesium light. The change in colour was exhibited to the members. These gems are being sold at Colombo as blue alexandrites (chrysoberyl). Many sapphires show this dichroism; but good specimens are not common.

RAMIE—says an expert—grows luxuriously, and with very little cultivation in both temperate and tropical climates providing that the atmosphere is fairly moist and the ground not swampy. Given a fairly warm and damp air, the rods grow quickly to a height of ten to twelve feet and are of a uniform character and easy to decorticate. But if the climate is irregular, and dry periods occur, then the vigorous growth of the stem is checked, and the bark is hardened and ripened to such an extent as makes separation of its fibres difficult. The main difficulty, however, has up to the present been experienced in the absence of a suitable machine to properly separate the fibre from the other constituent of the stem.

OSTRICH FARM IN SAN ANTONIO.—Before April opens an extensive and completely equipped ostrich farm will be well established within San Antonio city limits. Mr. Thomas A. Cockburn of California, formerly of Ceylon, the promoter of the enterprise, arrived in San Antonio about a week ago, (says a *San Antonio* paper of Feb. 17) and lost no time in making the preliminary arrangements for establishing the farm. He is one of the most experienced and best known ostrich raisers in the country. In partnership with Edwin Cawston he owns two of the greatest ostrich farms in California—one at Los Angeles and one at Pasadena—which contain some 300 birds. For this season the San Antonio farm will be stocked with between thirty and forty birds. Mr. Cockburn's partner, Mr. Cawston, writes that he has picked out some of the finest birds on the Los Angeles farm to send to San Antonio, and that he has already fitted up a car for their transportation.

EUCALYPTUS IN EAST AFRICA.—The German Colonial Office reports that following upon the successful plantation of *Eucalyptus globulus* in German East Africa a small plantation of *Eucalyptus rostrata* (the red-gum tree) has been laid down at the Kovali Station, and it is doing well.—*Chemist and Druggist*, March 12.

AMSTERDAM COCOA BUTTER MARKET.—Our Amsterdam representative sends us the following information concerning the results of the cocoa butter auctions held in Amsterdam on the 1st inst. Of the 70 tons of *Van Houten's* make offered, all was sold at 47 to 48½. Dutch cents per half kilo, or an average price of 47.35 cents (about 8.35thd per lb.); of 20 tons of the "Hamer" brand 13½ tons were sold at 46½ to 46¾ cents (about 8.3-7thd to 8½d per lb.); of 5 tons from *Hollandische Cacaofabriek*, all was bought in; of 10 tons of *Foreign* make about 3 tons (Mackay & Co.) were sold at 45 cents (about 8½d per lb.)—*British and Colonial Druggist*, March 4.

ADULTERATION OF FOOD—says the *Daily Chronicle* of March 4:—

What is chocolate? What is Demerara sugar? What is butter? What is whisky? What is bees-wax? Judging by the information which appears in our news columns today, the authorities are disagreed, and the grocers, not being troubled by philosophic doubts serve out pretty much what they please when a customer mentions any of these familiar articles. According to an adulteration case that was tried yesterday, chocolate may legitimately contain a very large percentage of coco-nut oil and still be chocolate, whilst we have it on the authority of the public analyst for Islington that unless customers ask for pure sugar, pure butter, pure whisky, pure bees-wax, pure coffee, pure anything, they may legally be served with any mixture the tradesman offers, provided it is not poisonous. Which all goes to prove that our adulteration laws are an amiable imposture.

THE SAN JOSE SCALE—We are unwilling to create needless alarm, at the same time it is our duty to warn our fruit-growers of a possible danger, against which the Canadians and some of the States, of the Union have already taken action. Considering the enormous quantities of fruit imported from Canada, some of the Eastern United States, and even California, it is but too probable that the scale will make its way to this country. In California damage to the extent of millions of dollars has been effected. Within twelve years it has infested every fruit section of San José, and reached the orchards of Oregon and Washington. Evidently, says the *Canadian Horticulturist*, this pest will infest every orchard in Canada within the next ten years unless the greatest promptitude is taken to destroy it." We have already given illustrations of the insect.—*Gardeners' Chronicle*, March 12.

THE WOMEN'S BRANCH OF THE SWANLEY HORTICULTURAL COLLEGE has an enviable position at present. During 1897 it had the largest number of students it has ever had; at one time there were thirty-five students in residence. Moreover, the authorities are able to obtain remunerative employment for all their duly qualified students; the demand for lady gardeners is greater than the supply. It is pleasant to note that the Director of Kew Gardens now employs three of the Swanley Ladies; two have posts at the Edinburgh Botanic gardens; other as are as a convalescent home, an industrial farm colony, at ladies' schools and colleges; one finds employment in laying out gardens in London, under the Metropolitan Public Gardens Association. It is not generally known that four county councils—i.e., London, Berkshire, Essex and Kent—grant scholarships both to men and women to be held at the Swanley Horticultural College.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for April:—

Vol. IX.]

APRIL, 1898.

[No. 10.]

SEASON REPORTS FOR FEBRUARY.

ESTERN Province.—Paddy. Maha crop reaped, and being threshed in some places, preparations for Yala going on. Rainfall light. Crop prospects good and exceptionally fine in Rayigam Korale.

Central Province.—Paddy. Maha cultivation in various stages, prospects good. No cattle disease reported. Rainfall registered in Matale '41 in.

Northern Province.—Paddy. Reaping and threshing going on. Yield moderate in Mannar district, disappointing in Jaffna district. Rainfall registered in Jaffna 1'12 in. Health of cattle good a disease called munanginoi prevails among the goats in Mannar district.

Southern Province.—Paddy. Maha harvest on, preparations for Yala in progress. No. cattle disease reported.

Eastern Province.—Paddy. Munmari crops reaped in Trincomalee district. Health of cattle good. Rainfall in Batticaloa '04 in.

North-Western Province.—Paddy. The harvest is on, prospects generally good. Murrain still prevails, but is decreasing in many places. No rain in most parts, and where it occurred the fall was very scanty.

North-Central Province.—Paddy in various stages. Rainfall at Amuradhapura, 1'33 in. Health of cattle satisfactory, though murrain was reported from Eppawala Korale.

Sabaragamuwa Province.—Paddy. Maha harvest in progress in most places and outturn satisfactory. No cattle disease. Rainfall at Ruanwella, 5'14 in.

Uva Province.—Paddy. Maha fields, some being shown and some ploughed. Chena crops good on the whole. Fruits and vegetables plentiful and cheap. Weather dry. A few cases of murrain were reported from Wellassa, otherwise health of cattle good.

RAINFALL TAKEN AT THE SCHOOL OF AGRICULTURE DURING THE MONTH OF FEBRUARY, 1898.

Greatest amount of rainfall in any 24 hours on the 22nd, '19 inches.

Mean rainfall for the month '02 in.

Recorded by A. H. AHMAT.

THE VALUE OF BONE-DUST AS A FERTILIZER.

(Communicated.)

We have only just seen an article in the *New South Wales Agricultural Gazette* on the above subject, referring to certain experiments, the results of which should prove of interest to planters in this Colony who largely use bone-dust as a fertilizer.

In 1889 Professor Wagner of Darmstadt carried out a series of experiments which led to the surprising conclusion that the phosphoric acid in the ordinary raw bone-meal was so low in fertilizing value when compared with the phosphoric acid in superphosphate or Thomas slag as to be almost worthless. The estimated low value of bone-meal was based, it is said, not only upon its immediate effects but also on its after-effects. We need not refer at length to the details of Wagner's experiments, suffice it to say that equal quantities of bone-meal superphosphate and basic slag were used, and all other conditions were the same, but the results as regards both the immediate and after-effects of the bone-meal were so inadequate as to lead Wagner to put it down as practically worthless for its phosphoric acid. As a result of these experiments the Association of Bone-meal Manufacturers of Saxony appealed to Professor Märcker, of Halle, to investigate the question thoroughly. Märcker's experiments extended over 4 years (as against 3 of Wagner's) and embraced different kinds of crops and soils, and different brands of bone-dust, (raw, steamed and degelatinized,) representing the best qualities of bone-meal on the market. Prof. Wagner would appear to consider that the phosphoric in raw bone-meal, in steamed and glue-free bone-meal is about equal in value.

Where equal quantities of bone-meal and superphosphate were used, the results of the trial for early effect were as was to be expected, very unfavourable to bone-meal. As a result of a variation of the same experiment it was found that there is no advantage in mixing bone-dust with superphosphate, as the increase of yield is practically due only to the superphosphate. The soils in these experiments were sandy ones which are regarded as being particularly benefited by the application of bone-dust. The next series of experiments were conducted to test the fact whether bone-meal is really valuable for its after-effects, and, if, as it is reported to do, it permanently enriches the land.

With small quantities of superphosphate there were no striking results in the second year, as the greater part of the available phosphoric acid had already been used up in the first year. Where a larger quantity of superphosphate (but equal to the amount of bone-meal) was used, the after-effects were considerable, and though not as good as in the first year, were, nevertheless, very much better than the after-effects of bone-meal. During the third year, the after-effects of bone-meal as compared with superphosphate, were found to be still less favourable.

Another series of experiments went to show that the after-effects of bone-meal are not increased when used in conjunction with superphosphate. The results of the experiments above quoted would

appear to warrant one conclusion, viz., that, at all events, for sandy soils, which are exactly the soil supposed to be benefited by bone-dust, the action of the phosphoric acid in bone-dust does not approach the action of the soluble phosphoric acid in superphosphate, whether the bone-dust is used alone or with superphosphate, whether in respect to the immediate results or after-effects.

The next series of experiments were undertaken on different classes of soils, relatively rich in phosphoric acid, having been used in previous years for bone-meal experiments. The soils included sandy soils, loam, humous loam, clay loam, sandy loam, humous sand, &c. The results were again unfavourable to bone-meal manure. These experiments, as Prof. Märcker observes, would have an unwelcome result if it were not possible to treat bone-meal in a cheap way so as to make it more effective, and this can be done by means of a small quantity of sulphuric acid not enough to produce superphosphate but bicalcium phosphate, a form which, though insoluble in water, is ready available to the plant and little inferior in fertilizing value to superphosphate. This can be done by adding to every 100 lbs. of raw bone-meal, 20 lbs. of acid of 60° strength (Baume) or 40 lbs. to every 100 of glue-free bone-dust. It is advisable that the bones should not be in too fine a powder, but in a coarse state about the size of peas. The proportions given are said to be the most effective.

To quote Prof. Märcker's own words: "One may twist and turn the matter as one will, whether used with cereals or crucifers, in sand, clay, or loams, rich or poor in phosphoric acid, in cold or hot years, whether in respect to its effects upon the first or upon succeeding crops, the result is always the same, namely, the action of the phosphoric acid in bone-meal, whether raw or steamed, or glue-free, is invariably unsatisfactory, and the author comes to the conclusion that it is high time that raw, steamed and glue-free bone-dusts ceased to be regarded as phosphoric fertilizers; they require previous treatment just as the mineral phosphates do, in order to make effective fertilizers of them, and the author believes that the future of the bone-meal industry lies in the preparation of these products which the experiments here recorded have shown to be effective."

The inference to be drawn from these experiments is that the beneficial action of bone-meal—for that it is beneficial cannot be gainsaid—is due not to the phosphoric acid but to the nitrogen it contains. Prof. Märcker is reported to be—at the date of the article here summarized—engaged in a series of experiments, with the object of ascertaining more exactly the nature of this action. As far as he has gone trials have shown that the effect of the nitrogen in bone-meal is 70 to 80 per cent of that produced by nitrate of soda in sandy soil, and from 55 to 70 per cent in humus loam. It is said that an independent series of experiments carried out by Dr. Liechti and Dr. Voght of the University of Bern in 1896, goes to substantiate the results of Wagner and Märcker. In these trials it came out that the effects of Thomas phosphate were far superior to those of raw as well as degelatinized bone-meal.

A question that suggests itself to our mind is, to what extent is bone-dust affected, i.e., rendered

available to plants by the different climatic conditions (temperature, rainfall, humidity of the air &c.) in the tropics? Again, is the gradual conversion of insoluble into soluble phosphate sufficient for the needs of perennial vegetation such as tea and coconuts? These and many more questions occur to us as they will to our readers. We should like to know whether any one of our coconut planters have pitted bone-dust against super-phosphate and noted results? The views of Mr. Cochran and Mr. Hughes on the subject would be interesting.

OCCASIONAL NOTES.

The students of the School of Agriculture were taken over Messrs. de Soysa's coconut mills on Friday the 11th March, and witnessed the various processes in the manufacture of desiccated coconuts, while the preparation of copperah, coconut oil and coir was also explained to them. Our thanks are due to the proprietors of permitting the agricultural students to visit their works, and to the manager of the mills for kindly showing them over the premises and carrying out special operations for the benefit of the visitors.

A sale of stock drafted for the Government Dairy herd was held at the School of Agriculture on the 4th March, Mr. A. Y. Daniel acting as auctioneer. In spite of the wet weather the attendance was fair, and among those present were a few well-known Estate proprietors, such as Mr. F. Beven, Dr. Rockwood and Mr. W. Jardine. The following statement gives particulars of the sale:—

Cows.—Nancy, R33, Mr. Abdul Raiman; Maggie, R26, Mr. F. Beven; Tulip, R41, Mr. W. Jardine; Sunny, R55, Mr. W. P. D. Vanderstraaten; Bee, R31, Mr. Beven; Molly, R60, Mr. A. Raiman; Ellen, R44, Dr. Rockwood; Jessie, R25, Mr. Vanderstraaten; Pearl, R52, Dr. Rockwood; Polly, R91, Mr. A. Raiman; Ila, R30, Mr. Raiman; Phyllis, R72, Mr. Jardine; Cowslip, R55, Mr. Chas. Pieris; Hilda, R35, Mr. Vanderstraaten; Mary, R42, Mr. J. de Vos; Edith and calf, R62, Mr. Kretser; Effie and calf, R65, Mr. de Vos; Mirnie and calf, R36, Mr. Vanderstraaten; Frixty and calf, Rs 31, Mr. Beven; and Rane and calf, R38, Dr. Rockwood.

Calves.—1. Dr. Rockwood, R47; 2. Mr. R. Pereria, R41; 3. Mr. Dias Bandarnayake, R45; 4. Mr. Chas. Pieris, R20; 5. Mr. Pieris, R19; 6. Mr. F. Beven, R17; 7. Dr. Rockwood, R20; 8. Mr. Pieris, R28; 9. Mr. Vanderstraaten, R31; 10. Mr. Jardine, R70; 11. Dr. Rockwood, R45; and 12. Mr. Jardine, R100.

Mr. G. W. Sturgess, Colonial Veterinary Surgeon, who left Colombo for Karachi by the S.S. "Laos" about the middle of February, returned to Colombo on Saturday the 12th March by the S.S. "Independent" with some fresh stock for the Government dairy. The herd consisted of 32 cows (14 with calves) and a bull. The animals arrived in good condition and were safely landed the same evening—under the supervision of the Superintendent and Manager of the Dairy—and after being

driven to the School of Agriculture, were placed in quarantine in the Government Dairy quarantine shed. The cattle are a nice lot, and are all of the Sind breed.

In an article on the Coconut, contributed to the January number of the *Queensland Agricultural Journal*, by Mr. E. Cowley, the writer says: "The one great factor that must be considered in this, as in other tropical pursuits, is that of labour. Machinery of modern type has, of course, been introduced to deal with the coconut, and it is highly probable that as yet the fibrous covering has not been dealt with, so that the most economical results have been obtained. The extraction of the kernel known in commerce as copra, has also to receive attention from the mechanical inventor. The difficulty here is the hard shell and the extraction of the kernel. The old-fashioned method of breaking the shell and scraping out the contents with the curved sharp knife will have to be improved. Once the kernel is removed, the after-manipulation is simplicity itself." We would only add that the old and slow process of breaking the nut and liberating the kernel has now been entirely superseded by the use of the circular saw worked by steam power, with the result that the work is done with wonderful rapidity, the kernels being got out entire, while it is doubtful whether the excellent mechanical devices for treating the fibre could be much improved upon to give more economical results. To those who have been used only to the slow, tedious methods of dealing with the coconut once in vogue, the work of our modern coconut mills will come as a revelation.

Ngai or Ai Camphor is the subject of an instructive contribution to the January number of the *Queensland Agricultural Journal* for January last. As far back as November, 1895, an account of this substance was given in the Kew Bulletin where the plant yielding Ai Camphor was identified as *Blumea balsamifera*. In the *Agricultural Ledger* No. 5 of 1896, "Camphor," reference is again made to it under the head of Ngai Camphor of Burma and China. We there read that the Camphor is manufactured very largely at Canton, and that it is probably got from several species, that most frequently employed being *B. balsamifera*. Ngai Camphor is said to be chemically more allied to Barus Camphor (*Dryobalanops camphora*) than to China Camphor (*Cinnamomum camphora*), and is in point of price intermediate between the two latter forms. Good Barus is said to fetch as much as R80 per lb., whereas common Camphor is little more than half that sum per cwt. Trimen in his *Flora* has the following note referring to the plant under notice:—*Balsamifera* D. C. (*Conyza balsamifera* L.) is recorded for Ceylon by Moon whose locality is Kandy, and by Thwaites whose so named specimens collected in Trincomalee by Glenie in 1862, which are C. P. 3665. (See *Laggera aurita*). The true *B. balsamifera* is native to Assam, Burma, and Malaya; it was, however, called *Conyza abor Zeylonensis*, &c. by Plukenet, and on that account got included in Burm. Thes. 74.

"Ramie, its Cultivation, Decortication, Treatment, and Uses," is the title of a pamphlet issued by Messrs. Macdonald, Boyle & Co., the patentees of the decortivating and degumming process known as the Boyle process. The Ceylon agents for the firm are Messrs. Lee, Hedges & Co. of Colombo, the head office being at No. 39, Victoria Street, Westminster, London, S.W. The pamphlet contains an analysis of the plant, directions for planting and harvesting, estimates of crop, plant and machinery and other information that will be useful to intending growers. The most suitable areas for planting are within the tropics, and especially within 10 degrees North or South of the Equator, where there is a moist climate, and very little variation in the temperature, or in the rainfall throughout the year. For other facts and figures we must refer our readers to the pamphlet itself, for a copy of which we are indebted to Messrs. Lee, Hedges & Co.

We have received the third Circular issued by Mr. A. Baur, proprietor of the Ceylon Manure Works, referring to fertilizers for tea, coffee, cacao, coconuts, paddy, &c. The price per ton for the fertilizers varies from R125 to R135, the terms being net cash delivered at the Colombo Railway Station. According to the Circular the materials employed are of the best only, blood, fish, raw-bones and refuse, saltpetre being excluded. $\frac{3}{4}$ to $\frac{1}{4}$ of the phosphoric acid are said to be in a readily available form, the balance being more readily decomposable than steamed bones. The percentages (except in the case of tea for which the percentages have been fixed by Mr. John Hughes) have been revised by an Agricultural Chemist with considerable experience and personal knowledge of Ceylon. Mr. Baur also advertises almost every description of manure, in addition to his mixed fertilizers.

CEYLON V. COCHIN COCONUT OIL.

The following information derived from Cochin and Calicut gives further interesting information with reference to the manufacture of Cochin oil. "The superiority of 'Cochin' over 'Ceylon' oil lies in the finer quality of the former, occasioned by only *white sun-dried* Copperah being used in its manufacture. The European merchants who get their supply of oil from the native dealers, I understand, strain it properly before exporting it. It appears that there is also an inferior class of oil made here (Calicut) out of inferior Copperah. The inferior Copperah consists of unseasoned coconuts. This is not exported to European or American markets, but only to Asiatic ports. The term 'Cochin oil' is not a trade name but means the produce of Cochin. Some of the European merchants who were consulted are unable to give any further particulars in the absence of information as to the methods adopted in Ceylon for the manufacture of Coconut oil."

A communication from Cochin says, that if the coconuts are gathered every second month, *i.e.*, six gatherings a year, when they should be well seasoned and dried in bright sunshine for full seven days, the Copperah will make very

good white oil, fit to be shipped to any European port. If any of the nuts are gathered earlier these unseasoned nuts will, when converted into Copperah and mixed with the rest, go to spoil the colour and purity of the oil; the Copperah from unseasoned nuts also yield less oil than that from well-seasoned ones. That Colombo oil is not so much appreciated as Cochin oil is said to be attributable to the fruits there being dried by smoke. Indeed, no pure oil can be expected from nuts dried in smoke. Where it is good it is due to the vigilant care of the supervisors.

The above information coming, as it does, from the centre of the 'Cochin oil' industry is particularly valuable, and from it, we may infer, that it is the careful method of preparation that makes the Cochin oil superior to Colombo oil. A dry sunny climate what seems to be essential for good Copperah, and we have been told by more than one contributor to the *Observer* that oil equal to that of Cochin is produced in the dry parts of the Island. There is no doubt something in the after-treatment of the oil, such as the "careful straining" (why not also bleaching?) referred to in the first communication. Our best thanks are due to the Indian official for procuring the opinions which we have given above.

SOME IMPORTANT AGRICULTURAL-CHEMICAL FACTS.

Prof. Maercker, of Halle, in an address delivered before the German Chemical Society, spoke of the advances of Agricultural Chemistry during the last quarter of a century, and referred to many important facts that have been established mainly as the result of German research.

The chief sources of our knowledge of plant-food has been the method of water culture introduced by Sachs, Knoop and Nobbe, and the method of Sand Culture of Hellriegel, by which experiments were carried on in pure media, which not only make it possible to find out what substances are essential to plant life, but also the part played by each. By this means it has been ascertained that phosphoric acid is essential for the formation of nitrogenous substances, since the albumens which are of fundamental importance in the transformation of substances in the plant, result from an intermediate phosphoric acid compound as is indicated by the occurrence of leclithin in protoplasm. Again, iron is an essential constituent of chlorophyll and sulphur of albumen. The true function of calcium was for long doubtful; its action is now known to be of a "medicinal character," since it serves to neutralize the poisonous oxalic acid which is always an intermediate product of the oxidation of the carbohydrates. It was formerly thought that calcium fulfilled some important function in the leaves, as it was chiefly found in the foliage of plants. Since, however, the leaves are also the chief seat of the oxalic acid, this distribution of calcium is easily explained. The part played by potassium has only within the last three years been explained by Hellriegel, who by exact experiments with beetroot showed that the amount of sugar in the beet stands in close

relation to the amount of potassium provided. P. Wagner has made the interesting observation that the potassium may be *partly* replaced by sodium.

The exact value of magnesium is not yet well understood, but it appears to be of importance in the formation of the nitrogenous substances of seeds, as in these considerable quantities of magnesium phosphate occur.

Nitrogen is, of course, an indispensable plant-food, for it is an essential constituent of albumen.

In addition to the quantities of mineral substances required by plants to enable them to grow healthily, further quantities are found to be essential to satisfy what has been termed (though not very aptly) the mineral hunger of the plant. This is explained by an example. E. Wolff found that for the production of parts of the oat plant (dried), 5 parts of phosphoric acid were necessary when the remaining mineral substances were supplied in excess. The following quantities of mineral matter were found to be essential for 100 parts of oats: Phosphoric acid, 5; Potash, 8; lime 25; magnesia, 2; and sulphuric acid, 2; making a total of 1.95. There is, however, no oat plant which contains so little as 1.95 per cent of mineral substances, the minimum being 3 per cent. The difference (1.05) is the measure of what has been called the "mineral hunger," and represents the mineral matter which does not perform any special function. The excess may be supplied in the form of some indifferent substance, as silica. This observation is said to be of considerable interest to the farmer, for it shows that it is not economical to manure crops with pure substances.

It has been found, unfortunately, that the chemical analysis of a soil is of little use as a guide unless accompanied by a "mechanical analysis," or a determination of finely-divided constituents present in the soil, which form the only part that presents a sufficiently large surface for the exercise of the solvent action of water and its dissolved carbonic acid. There is one case in which chemical analysis is said to be of the greatest importance, viz., when there are traces only of some necessary elements in the soil. Here there is a question of a need for a manure containing this substance. If on the other hand large quantities are present, it does not follow that there is a sufficiency in the soil even when the latter is in a satisfactory state of division, for the substance may be present in an insoluble refractory form. This is commonly the case with nitrogen, which exists in the soil chiefly in the form of a mixture of indefinite nitrogenous substances known as *humus*, or mould. These substances sometimes easily give up their nitrogen to plants, but in other cases are very refractory. The uncertainty as to their action is indeed so great that certain peaty soils are known which consist almost entirely of humus, but contain nevertheless an insufficiency of available nitrogen.

Phosphoric acid affords another illustration. The soluble phosphoric acid of the manure is absorbed by the soil as dicalcic phosphate, which is comparatively easily soluble in the soil water. With time, however, it may change in the soil to the insoluble tricalcium phosphate or even to iron or aluminium phosphates, which are still less soluble.

In the case of calcium, chemical analysis has been found to be of considerable service in determining what manuring is required, since calcium is chiefly valuable in the form of carbonate or humate, and these are easily estimated in the soil.

Since then the direct method of soil-analysis is an insufficient guide to manuring, it is fortunate that chemists have been able to develop a successfully an indirect method. This is the *cultivation method*, by which plants are allowed to grow in the soil under examination, after taking care to provide a sufficiency of all plant-food stuffs except the one, e.g., phosphoric acid, whose presence in available form is being tested. The plants are then analysed, and the results compared with the analyses of the same plants grown on soils provided with all the necessary plant-food stuffs. As an important result of the method it has been found that different plants take up very different quantities of the same mineral substances. On this is largely based the system of rotation of crops, where the second crop is so chosen that it chiefly removes the ingredients of the soil which have been left by the preceding crop.

With the aid of the cultivation method it has also been possible to draw up the following table, which represents the relative values of the different nitrogen compounds for plant-food:—

Nitrogen of Saltpetre	...	100
" " Ammonia	...	85-90
" " Albumen	...	60

This table may be made use of in determining the nitrogen value of a manure.

The cultivation method may be used for testing the value of manures of all kinds. Thus it was by a few cultivation experiments that Wagner in Darmstadt first showed the very great value for agricultural purposes of the "Thomas" Slag, produced as a by-product in the manufacture of iron by the basic process of Thomas-Gilchrist. The million tons of phosphate meal annually produced in Germany is now wholly utilised by the agriculturist, and its preparation for the farmer has become an important off-shoot of the iron industry.

Prof. Maercker's address then goes on to deal with other points which we may refer to in a future issue. Those we have noticed are undoubtedly of interest and value, and deserve to be carefully noted by our readers.

NOTES FOR CATTLE OWNERS IN CEYLON.*

This is the title of a little pamphlet of 16 pages by Mr. C. W. Sturgess, Colonial Veterinary Surgeon. The headings of the different chapters as given in the Table of Contents are: Food, Water, Shelter, Signs of Health and Disease, Breeding and Rearing, Prevention of Disease, Contagious Diseases, Nursing, and a List of simple Veterinary Medicines. What will be most interesting to cattle owners is, of course, the treatment recommended for the various forms of cattle disease that occur in the Island. The author, however, refers only to the two common forms of

contagious disease, viz., Cattle Plague (Rinderpest) or Murrain, and Foot-and-Mouth disease or Hoof-and-Mouth disease, and we quote the passages under the head of "treatment" for the benefit of our readers.

Treatment for Cattle Plague.—The diseased or suspected animals must at once be isolated, and all communication between healthy and diseased animals absolutely cut off. A supply of good water may be placed with the animals, in which is dissolved $\frac{1}{2}$ or 1 oz. of saltpetre. At the first, when there is constipation, $\frac{3}{4}$ lb. of Epsom salts or one pint of linseed or castor oil may be given as a laxative. Either of the following prescriptions may be given as medicine:—

Prescription I.

Hyposulphite of Soda	... 2 oz.
Quiniae (or Quinoidin)	... 2 drs.

To be given every day in one quart of congee to full-grown cattle. If diarrhoea sets in with blood in the fœces, powdered opium 1 to 2 drs., or bhlang $\frac{1}{2}$ to 1 oz., should be combined with the above.

Prescription II.

Hyposulphite of Soda	... 2 oz.
Powdered Cinchona bark	... 1½ oz.

To be given daily in a quart of congee.

Prescription III.

Quinine (or Quinoidin much cheaper)	2 drs.
-------------------------------------	--------

To be given daily in a quart of congee.

Prescription IV.

The following is said to have been used with good effect in India:—

Camphor	... 2 drs.
Datura	... 2 drs.
Chiretta	... 1 oz.
Arrack	... 4 oz.

To be given in two quarts of gruel morning, and evening. The animals must be well-nursed and given congee and decoction of bael fruit, and good water and any soft food. No solid hard food must be given for some time. Milk and sloppy bran mash may be given, and a small allowance of tender young grass; during recovery such medicines as chiretta, arrack, Cinchona bark.

Treatment for Foot and Mouth Disease.—All the affected animals must be segregated, and the rules mentioned under "Prevention of Disease" put into force as far as possible.

For mouth and feet dressings the following are ample, good and cheap:—

Mouth Dressing.

Powdered alum	... 1½ oz.
Water	... 1 pt.

A little to be poured into the mouth night and morning.

Feet Dressing.

Powdered sulphate of copper	... 1 oz.
Alum	... 1 oz.
Water	... 1 pt.

Apply to the sores on the feet twice a day. The feet must be kept quite clean by washing with water containing a little Jeye's fluid daily.

When the sores on the feet do not heal properly the following dressing should be applied in addition to the above twice a day:—

Margosa oil or Coconut oil	... 8 parts,
Turpentine	... 2 "

Internally give $\frac{1}{2}$ or $\frac{3}{4}$ lb. Epsom salt daily for three or four days in a quart of congee, which will relieve the constipation and fever.

We hope the author will also treat of ordinary cattle ailments, including those incidental to milking stock and calves in another pamphlet, as the want of a knowledge of the treatment of many of these (such for instance as Hoven) often results in the loss of valuable animals.

FRUIT CULTURE.

(Continued.)

One way of preventing the dissipation of moisture consists in covering the soil round the tree or plant with a layer of short broken straw or waste stable fodder. Gardeners knew this plan of old and call it "mulching." Under it, however dry the air, this soil is always more or less moist, never cakes into a crust and never robs the moisture in the region of the roots. In fact, loss of moisture through capillarity is stopped by the capillary tubes being blocked up and prevented from communicating with the atmosphere. About a fourth only of the total effect in preventing loss of moisture is due to the mulch insulation or shading the soil from the rays of the sun, the rest is due to its stopping the capillary withdrawal of the soil moisture at a point short of the evaporating surface. If it were possible to completely mulch the soil of an orchard in this manner, there would rarely if ever be sufficient dry of the ground to cause wilting or dropping of the foliage due to want of moisture. But the method is generally possible only on a small scale. One objection, even if it were generally possible, is the danger from possible fire in dry weather. Mulching has also been used with success on hill slopes in preventing washing-away of the soil.

Another way of preventing loss of soil moisture is by means of a soil mulch. If the top tilth were constantly kept broken up and never allowed to settle down into a close crust, it will almost as effectually check loss of deep-seated moisture by capillarity as would a mulch of straw. For this reason the soil between the rows of trees in an orchard must be kept constantly stirred to the depth of 3 or 4 inches. This is now commonly done on large areas by means of the implement known as the cultivator. One result of this constant stirring is that the land is kept perfectly clean. Nothing is more strenuously insisted on in fruit-culture by the best authorities—men who are speaking of their own practice upon farms of immense area—than this practice of keeping the surface soil in a loose powdery tilth.

BUFFALOES AS DAIRY STOCK.

We are indebted to Capt. Channer for a cutting from the *Pioneer* of Feb. 18th which he sends us from Agra, with the remark that milch buffaloes if kept on the soiling system are more remunerative than cows, that they should find the climate of Ceylon suitable, and that they should

give more milk than an ordinary Australian cow. But how are we to get over the prejudice in Ceylon against the use of the buffalo milk? We remember Mr. Mollison, the Supdt, of Farms, Bombay Presidency, being both astonished and amused to hear of it? People here no doubt base their objections to buffalo milk on the habits of the amphibious Ceylon buffalo fed on coarse and unwholesome food. Our first experience of the Indian milch buffalo was at Poona where we were much struck by the magnificent specimens of the Surat and Jaffer-badi breeds kept in the dairy. Here is what we wrote at the time of our visit, early in 1893:—

"Buffaloes are in great favour on the Bombay side as milk and especially butter producers, and much surprise was expressed by those engaged in dairying at my statement that there is an insurmountable prejudice in Ceylon against buffalo butter. In the Bombay Presidency nearly all the butter is made from buffalo milk, the produce being slightly dyed with anatto... Colouring with a standard solution of anatto is of course quite common in English dairies. The Surat buffalo is, according to Mr. Mollison, unsurpassed as a butter producer, and even in the hot weather, while I was there, 1 lb. of butter was being got from 10 lbs. of milk, and the best milker was producing 36 lbs. of milk. With the price of butter at 12 annas (or 75 cts.) per lb., a good Surat buffalo thus gave by sale of its produce nearly R3 per day. In Poona, buffalo milk was selling at a higher price than cow milk."

We have more than once recommended that the miserable breed of Ceylon buffaloes should be improved by the introduction of some good blood from India, and we hope that this will be remembered in connection with the breeding establishment at Walapana which is spoken of. Here is a reference to the Allahabad Dairy from the cutting sent us by Capt. Channer:—

One of the most successful departments of the Allahabad farm is the dairy, from which the troops draw their supply of rich wholesome milk and butter made according to British methods by the aid of British dairy machinery of the most approved pattern. Three hundred female buffaloes and two hundred milch-cows are housed and kept on the "soiling system," being let out merely for exercise for four or five hours in the forenoon before the greatest heat of the day occurs. The buffalo is the great milch-cow of India, yielding double the amount given by an ordinary Indian cow, and, *when well fed and cared for* producing milk of extraordinary richness in butter-fat and milk solids generally. One pound of butter can be produced from one gallon of such milk—an amount more than two and-a-half times that yielded by average cows' milk in Great Britain. It is generally believed that buffalo milk is rank in flavour and inferior in quality, but that is true only of animals which feed on village garbage. Although it possesses, partly owing to the large amount of solids present, characteristic features which enable the palate to distinguish it from cows' milk, consumers who have had experience of it immediately complain if cows' milk is substituted for it.

The best female buffaloes come from the districts of Hissar and Rohtak, and cost from R100 to R300. Their daily average yield while in

milk is four and-a-half gallons, while some have been known to give eight gallons a day. This is an indication that the practice adopted at Allahabad of keeping bulls specially selected from heavy-milking families will ere long greatly raise the yield of the herd.

In addition to grass, silage, or hay, according to the season, an allowance of 7 lbs. of concentrated food, consisting of linseed, cottonseed, and pulse-husks, is given in three feeds daily to animals, in full milk, the amount being lowered as the yield decreases towards the end of the season. The total annual cost per head, including a due proportion of the remuneration of an attendant, who receives eight rupees a month or £6 a year, is about £11.

Good butter sells freely in India at 11d. per lb.; but the white lard-like appearance of buffalo butter necessitates the colouring of the cream before churning, to please the eye of the consumer, though the quality is not thereby improved. The margin of profit at the above cost of production is quite large enough to make it possible to develop a remunerative trade in the export of butter to Europe.

The milkers employed are Punjabi men with very powerful wrists, as may be gathered from the fact that each milks ten cows and ten buffaloes morning and evening. Village cattle are prevented from passing the farm boundaries, with the object of warding off the various forms of contagious disease which are so common among Indian cattle and of averting the evil consequences which would result if the inferior bulls, herded with them, were to approach the selected females of which the dairy is made up.

Young buffaloes begin to be milk-producing at about three and-a-half years of age, and young cows at three years. It is much to be deplored that in the surrounding district good cows are decreasing in numbers, and consequently rising in price. Prices have gone up within recent years from R50 each to R100 and R120 (£3 2s. 4d. to £6 6s. and £7 12s.), chiefly owing to large numbers of the best milkers being taken to Calcutta and Bombay and slaughtered, after milking for but one season. This custom is mainly due to the present impossibility of getting food to tide them over the few months when they are not in milk and, in some measure, to the change of surroundings and probably to food-producing temporary barrenness. It behoves Government to attempt some means to stop or minimise this disastrous drain upon the best milking stock of the country. And surely something could be devised to bring about the desired result without interfering with the freedom of action of those engaged in the business. Another almost equally important result to be achieved, so far as these great centres of population are concerned, is the development of a cheap and abundant milk supply, which would not be subjected to the dangers of adulteration now prevailing.

In consideration of the value of the produce of milch-cattle, it was found that to keep all progeny of the cows at Allahabad was too expensive. An annual fair has been established, at which most of the superior young bulls bred on the Government farm are disposed of to the natives at twelve to fourteen months old, when

the most dangerous period for stunting their growth by an insufficient supply of food is past. The natives can complete the rearing of them at little cost by using up spare or unmarketable fodder, the attendance being supplied without outlay by the members of the family. The price the native pays is from £1 10s. to £2 10s., and when the animals and their male progeny are three and-a-half to four years old, and fit for work and transport purposes, the Commissariat Department buys them in at from £4 10s. to £5, only exceptionally good specimens bringing higher prices.

RINDERPEST EXPERIMENTS IN SOUTH AFRICA.

In the December number of the Magazine an account was given of the serum inoculation for Rinderpest. Experiments in this method were started by Veterinary Surgeons Pitchford and Theiler in the Transvaal, and were developed and brought to a successful issue by the French experts Drs. Danysz and Bordet, assisted by Mr. Theiler. The *Cape Agricultural Journal* of the 6th January contains a fuller report of the work of these French scientists, who claim not only a preventive but a curative virtue for their system of inoculation with the serum, or rather the defibrinated blood of "salted" animals. A further advantage claimed for this method is that its protective effect is speedily produced.

The most suitable period for drawing blood used for inoculation is from 1½ to six months after the animal is salted for rinderpest, cattle that have suffered most from the disease being selected for the purpose. The maximum strength of the blood is reached about two months after the cure; but instead of making use of the blood of animals simply salted, it is recommended to increase its immunising property still further by subjecting them to two or more injections of virulent blood before bleeding them.

Where a great number of animals are to be inoculated, defibrinated blood is preferred to serum, as the former is more economical and can be more quickly and cleanly prepared. The injection is to be made as soon as possible after the blood is prepared, and unless strict precautions are taken it cannot be kept longer than one day. This defibrinated blood can be used either for (1) animals in whom the disease has already developed, (2) those that already possess its germs and in whom the disease is in its incubative stage, or (3) animals that have not yet been affected by the contagion but are in danger of catching it. When those of the last-mentioned description are injected, that is when the inoculation is intended as a preventive, the animals are brought into close contact with the sick ones on the same day or the next, so that they may contract a mild form of the disease and recover, and thus get permanently salted. When animals already sick are to be treated larger doses of the blood should be injected so as to mitigate the effects of the virus in their system and cure

them. Out of 336 head of cattle which were inoculated by the French experts, no less than 309 were successfully salted; the death-rate thus being only about 8 per cent.

The instruments and appliances necessary for this method of inoculation are an enamelled pan that will hold about ten bottles, a trocar, a scalpel, a brush made of iron wire, and hypodermic syringes. Strict cleanliness must be observed in the process of drawing blood from the salted animal, as well as during defibrination and inoculation; and none of these operations must take place in the sun. The particulars as to inoculation and subsequent treatment are as follows:—

The healthy animals each receive a first injection of 100 c. c. of blood. They are then brought in contact with the sick, or, if possible, infected by spreading on the nose the contents of the bowels of an animal that has just died of rinderpest. The contact must be kept up for several days so as to ensure speedy infection. They receive a second injection (of 100 c. c.) five or six days after they are infected.

"To be thoroughly salted the animals must become sick and recover. But it may happen that out of a herd brought under protective treatment, a certain number of animals become sick only from twenty to thirty days after the injection, that is to say, at the moment that the animal loses from its body the blood which should protect it from the deadly disease. In such cases a fresh quantity of 100 to 200 c. c. of blood must be injected in order to cure them and thoroughly salt them"

The infected cattle must be carefully fed and nursed as in ordinary rinderpest cases.

Animals already sick must be injected for the first time with 200 to 300 cubic centimeters of blood from salted animals, and two or three days later there must be a second injection of from 100 to 200 c. c. of blood if the cases do not get better.

In conclusion, it is necessary for us to know the relative merits of the above method as compared with Dr. Koch's. Each of these has its proper place and application, and in this connection the Report of Veterinary Captain Haslam is very important as summing up the opinion of a recent Congress of Veterinary Surgeons and Bacteriologists assembled at Johannesburg. The bile inoculation invented by Dr. Koch is considered the best for uninfected herds while rinderpest prevails in the neighbourhood; and the immunity produced by bile is said to be increased to an unknown extent by injecting, 12 days afterwards, the blood of an animal suffering from rinderpest. The serum or blood system of inoculation is considered the only suitable remedy for infected herds.

Mr. Haslam, however, says: "There can be no doubt that all modes as yet known of dealing with rinderpest in South Africa are imperfect and much work still requires to be done." It will thus be found that while seeking to profit by the labours and researches of eminent bacteriologists, we cannot at least for the present afford to despise such simple and homely methods of prevention and suppression as quarantine, isolation, segregation, disinfection, &c.

GENERAL ITEMS.

Prof. Wallace, of the Edinburgh University, has contributed an interesting paper on the Dairy question in India and the growing of fodder for cattle. He favours the system of co-operative dairying for which he believes there is a great future in India. The case of the Allahabad Dairy Farm, to which we made reference in our article on Buffaloes as Milking Stock, is quoted as an instance of remunerative dairying which might be emulated.

The following, says the *Queensland Agricultural Journal*, may prove of use to those who would be glad to know the area of oddly-shaped field without recourse to a Surveyor: 5 × 988 yds., 10 × 484 yds., 40 × 121 yds., 70 × 69½ yds., 80 × 60½ yds., 60 × 726 ft., 110 × 397 ft., 130 × 363 ft., 220 × 181½ ft., or 440 × 99 ft., contain *one acre*.

Mr. H. C. Russel, Government Astronomer of New South Wales, mentions the following fact in disproof of a generally accepted belief:—The destruction of forests in New South Wales from the time that ringbarking was introduced, and for some 15 or 20 years after, would seem to have been more rapid than the destruction of any other forest in the world, and during that period the rainfall gradually increased. There is a clear proof that the rainfall in this part of the world did not get less as the trees disappeared; and in other countries where the question has been fully investigated, it has been found that the rain comes whether there are trees or not.

Albert Gale, an authority on Bee-culture, writing on the influence of bees on crops, makes some interesting observations regarding pollen. He refers to the variegated laurel (*Aucuba Japonica*) a dioecious tree which was introduced into England by the Dutch from Japan. For a long time no seeds of this tree could have been got owing to the fact that the plants first introduced were "female" ones, till a Mr. Fortune brought over some "male" plants, when the original trees produced an abundance of fertile seed. Now, he adds, the pollen of the variegated laurel is an article of commerce in the London Covent Garden market! Referring to the enormous number of pollen grains discharged from flowers, he mentions the fact that the flowers on a Chinese laburnum (*Wisteria Sinensis*) were calculated to contain no less than seventy-seven billions of pollen grains.

The Holstein or Frisian breed of cattle is well-known for the milking qualities of the cows. In an account of the breed by the Principal of Hawkesbury Agricultural College, reference is made to a imported cow by this breed named "Dairymaid," whose milk records in Victoria are said to have been never surpassed. In 1887 she yielded, at a trial, 128 lbs of milk in two days, this quantity producing 4 lbs. 11½ oz. of butter. The yield of milk given above is equivalent to 78 "bottles" (26 oz.) or an average of 39 bottles a day.

Telogy is a strange word to many and therefore needs some explanation. It is derived

from two Greek words meaning "at a distance" and "off-spring," and may be freely translated as the science of remote influence in the production of species. Briefly, the question which this science sets out to answer is, Does the first impregnation of the ovaries influence several or all the subsequent progeny of the female? In the experience of many breeders the facts appear to favour an affirmative answer, but the absence of a carefully organised series of experiments has hitherto made it impossible for anyone to take up a positive attitude. Prof. Cossar Ewart, so well-known from his connection with the Edinburgh University, is carrying on such a series of experiments, using Zebra stallions for first impregnating the ovaries of males, owing to the characteristic markings of this class of animal. An account of the Professor's work, as far as it has gone, is given in *The Scottish Farmer* of February 19th, and so far there appears to be grounds for believing in telogy or permanent infection of the germ, but it is impossible to dogmatise yet till the experiments have advanced a further stage.

One of the dangers of unboiled milk is poisoning by tyrotoxin, a characteristic milk product, described as an unstable poison, which is destroyed at a temperature 18 degrees below boiling point (194° F). The symptoms of this form of poisoning are nausea, violent headache, convulsions, and, in the case of death, a blanching of the alimentary canal. The poison particularly affects young children: In a case which occurred at Halifax, the jury emphasized the recommendation that milk should always be boiled before being given to young children.

The addition of salt to the food of animals does not increase the digestibility of the food consumed, but increases their appetite, and tends to promote repair of tissue by its searching diffusion through the body. Experiments by Bousingault showed that salt increases muscular vigour and activity among cattle, and improves their general appearance and condition. Where muscular strength is the object of feeding, a regular supply of salt improves health and vigour; thus it is that horses derive such benefit from partaking of it. The allowance of salt should not of course be overdone, as it will then throw too much work on the kidneys and even induce disease.

The difficulty in calf-rearing should be greatly minimised by the adoption of an arrangement such as is described below. A teat, about 4 in long, is fixed to one end of a bent tinned iron tube. The bucket containing the food is hung on a rail on the outside of the pen. A convenient hole is made through one of the boards of the rail into which the teat is fixed, the point projecting out on the inner side while the iron tube dips into the bucket. When the milk or other thinly-prepared food is put into the bucket the calf can only drink at a slow rate, giving time for the saliva to mix with and prepare the milk for digestion. In this way scouring and pot-bellies will be avoided. Teats, as described above, are supplied by Messrs. Clark & Co., Clarence St., Melbourne, at 1s. 8d. each.

[No. 11.

THE HOME OF "CARYOTA URENS."

THE CEYLON JAGGERY PALM.

HERE is generally speaking, to the youthful mind a certain glamour surrounding the term Palm, primarily produced perhaps by the frequent mention of the name in holy writ, and the representations of the tree in books and pamphlets written for the young. As a child, the first book I had the patience to read from cover to cover was *Paul and Virginia*, and it was only very recently that I stumbled across a copy of the same book, and read it again with interest. The first reading gave birth to the longing to visit the tropics. This desire grew till I reached the state of manhood, when it was somewhat suddenly gratified, and I set sail in the year 1862 for India.

In those days Palms were not to be seen on "coaster's" barrows, otherwise the desire to visit foreign climes for the sake of seeing their Palm-groves might have been somewhat damped. I had visited the Palm-house in the Edinburgh Botanical Gardens, and before embarking at Southampton I paid a hurried visit to Kew. What I saw at these two places only whetted my desire to pursue my journey to the East.

Arrived at Malta, I had the satisfaction of seeing Palms growing, not under glass, but under the sunny sky. Alexandria came next with its cloud of windmills and clusters of Date palms. Then the journey from thence to Cairo revealed a country mostly under water, with the stems of the Date-palms in the numerous groves standing in the flood, and gratefully taking up the revi-

vifying waters of the Nile, their plumes tossing and waving as if in delight. Bombay, with its limited number of cultivated Coconut Palms brought renewed pleasurable feelings; but Calicut being my destination. I was totally unprepared for the glorious sight of cultivated Coco and other Palms which met my view as I coasted along the Malabar coast for several hundred miles in a native craft.

At first I was puzzled to know what the green belt reaching to the very sea consisted of. Our craft keeping well off shore, it was not till approaching the port of Calicut that I came to know that this broad evergreen band, reaching for so many hundred miles, was made up solely of Palms, the Coconut predominating, of course, with an occasional patch of Areca and other species.

On landing late in the evening I was conducted to the house of a friend situated on rising ground, and commanding a full view of this wonderful Palm zone. I slept that night in an upstairs-room with a spacious balcony, used in these hot climes as a promenade in the mornings and evenings. At daybreak I was aroused from a refreshing sleep by a native servant, who brought me a welcome cup of tea and slice of toast. Light was streaming in by the balcony windows. The sea-breeze had just begun to blow, and I could hear the distant murmur of the waves on the sea-shore, the plaintive screams from the flocks of kites as they flitted past, with heads bent downwards in search of their morning meal. These sounds were all that disturbed the silence of the morning air. As I stepped on to the balcony I shall never forget the sight that presented itself to my gaze. I looked down upon a veritable sea of Palms, gently weaving their

magnificent fronds in the light morning air. The house was surrounded by them, up to the very walls, and as far as the eye could reach nothing but Palms. Monotonous, you may say; yes, but very grand in its monotony! At that moment I thought of Edinburgh and Kew, and smiled. Mine host joined me on the balcony. I did not wish him good morning, but instead exclaimed, "That sight is worth a hundred voyages from Southampton to Malabar!"

It was difficult to imagine oneself in the midst of a thickly native-populated district, the scene having a certain wild appearance about its giving rise to the thought of the calm solitude of the jungle, and the absence of man. This illusion was quickly destroyed by a subsequent walk through the Palm-grove. Then were seen the innumerable native huts, with walls and roofs composed of the trunks and fronds of their loved Coconut Palm, nestling amongst the contorted stems of the growing Palms, and effectually protected from the burning heat of noonday by their glorious crowns of spreading fronds. This Palm, as it is cultivated in these elimes, has no pretensions to the straight-stemmed dignity of the Areca, that "arrow-shot from heaven," the Palmyra Date, or Caryota; but the groves of stems appear in wanton entanglement, leaning in all directions, but always with the crowns turned heavenwards.

Occasionally, but not often, does the stem divide eight or ten feet from the ground, and produce two crowns of leaves. I do not think that this Palm is included in the list of sacred trees of the Hindus, but they seem to treat it with the same care and affection as if it were. Sometimes they will build their huts around the stem of a Coco-palm, thus giving the tree the appearance of having grown through the roof. So far as I can remember, it used to be calculated that each Palm-tree yielded, on an average, from nuts and "toddy" about two rupees (four shillings) per annum; so that an acre of Palms calculating 400 trees to the acre, would yield an annual income of £80, no small sum to a native proprietor.

After a week's stay at Calicut, amongst its Palm-groves, Mango, and Breadfruit-trees, I started for my final destination, viz., the Coffee-producing district of Wynaad in Malabar. To reach this I had to cross the Western-Ghaut chain by a pass in the mountains, and it was thus I first came in contact with tropical vegetation in one of its grandest phases.

Quitting the Bamboo forest at the foot of the mountains, and before reaching the mighty evergreen forest, a belt of sub-arborescent vegetation is encountered. In riding slowly through this I can well remember being struck with the extreme beauty of two plants, viz., *Lagerstromia Flos-reginae*, and *Cycas circinalis*. These were growing in abundance, the first-named being prodigal in display of its superb rose-coloured racemes, and the latter growing in large groups among granite boulders, which it draped with its beautiful fronds. Higher up the western Ghaut, forest proper commences, and continues till the crest of the ridge is reached, some 3,000 feet above sealevel.

The zig-zag road for a considerable way follows the track of a deep ravine, at the bottom of which one could hear the rushing of a mountain stream, but owing to the dense tropical foliage no water was visible. Before reaching the first thousand feet of elevation, an occasional group of tree-ferns was seen on the sides of the ravine, and thorny *Calamus* climbing its way to the

branches of lofty trees, as if to free itself from the dense foliage beneath, and show to the world its crowns of graceful fronds. As a matter of fact, this was the first wild Palm I had ever seen, but it was—though passingly beautiful—opposed in appearance to the ideas in one's mind of the dignified and independent grace of a Palm-tree proper. Reaching the summit of the Ghaut it was but a short ride to the first Coffee plantation, where I rested for a day or two, and where I had my first experience of that warm hospitality so well known amongst Europeans in India. Strange that the manager of this plantation should prove to have been an English gardener, the late Mr. James Boosey, an excellent and successful planter, as well as estimable man.

In going the round of the plantation in the cool of the evening with mine host, I had my first sight of the *Caryota* Palm in a wild state, which had even a greater interest for me at the time than the surrounding fields of Coffee shrubs, the cultivation of which I had come all the way from England to learn. I saw the noble Palm at its best, a little colony of trees of various heights the tallest bearing heavy masses of fruit, forming a strikingly beautiful appearance. The bipinnate leaves, with their ultimate divisions shaped like the fins and tail of a fish—together with the huge spadices of golden berries hanging from the brown trunks of the highest trees, give them a unique and elegant appearance. Nature, in one of her mysterious moods, has ordained that these wonderful drooping bundles of golden seeds shall be produced on the adult tree first at the top, and eventually at the very foot of the trunk, when the plant dies. She has, however, made ample provision for the reproduction of this beautiful tree by the enormous quantity of seeds produced by each spadix, and the suckers which the tree throws up. This Palm would seem to shun the interior of the dark mountain forests of the western Ghauts, and it chiefly grows on their outer skirts where, so to speak, it obtains the better opportunity for the display of its graceful fronds, and enjoys that necessary light and air which are wanting amidst the gigantic forest vegetation. It is also curious and interesting to find that wherever a homestead is seen on the edges of these forest, and overlooking the rice-fields, the ryot, in addition to such beautiful evergreen trees as the Mango, Orange, Jack, Roseapple, and others, is sure to have his garden furnished with a small colony of the *Caryota* Palm consisting of from six to eight trees from 70 to eighty feet, down to seedlings of some 2 to 4 feet in height. It is not quite clear whether the ryots have expected these sites for their habitations owing to existing groups of Palms, or have reared the trees from seeds or suckers, but the well-known love of the Hindoo for picturesque spots in or near which to locate his homestead, would justify the opinion that previously existing groups of the *Caryota* Palm has influenced his choice of a site for his homestead.

On the Nilgherry Mountains there exist a singular race of pastoral folk named Todas, few in number, illiterate, lazy, dirty, immoral, and degraded, and yet these people have admittedly selected the very loveliest and most picturesque spots on all these beautiful mountains for the building of their huts and villages.

That this Palm is known to require plenty of light and air for its development is shown by the fact that when small clearings are made in the forest of Malabar by the jungle tribes for

the purpose of cultivating Cardamoms, *Caryota urens* is sure to make its appearance, together with the young seedling Cardamom plants, doubtless coming into existence from seeds which have lain under the thick coating of vegetable matter together with those of Cardamom, it may be for centuries, awaiting the advent of light and air to effect germination. It is perhaps worthy of mention that Cardamom cultivation in Southern India consists solely in first felling small patches in the great forests, and afterwards simply keeping the brushwood low by one or two yearly cuttings with the billhook, the Cardamom plants appearing in abundance and producing fruit in the course of three years without any other cultivation whatever, or artificial sowing of seed. Yet another proof, I think, may be found that the *Caryota* will not succeed in the too close proximity of other trees, in the fact that in the Bamboo or deciduous forests which stretch from the foot of the Western Ghats to the confines of Mysore, occasional patches of evergreen forest occur containing trees exactly similar to those found in the parent forest but completely isolated, and frequently separated by many miles of Bamboo Jungle. The soil, too, of these patches in every way resembles that of the western slopes, and is inlaid, as it were, into the black mould of the Bamboo belt. These isolated clusters of evergreen trees are inexpressibly cool and refreshing to the eye during the hot and dry months of the year, and when the surrounding Bamboo clumps and hardwood-trees are destitute of foliage.

The natives have instinctively fixed upon these beautiful spots for the location of an idol, partly surrounded and protected by a wall of rough stones, so that they are all tinged with the glamour of sanctity; and woebetide the person who dares, in any way, to profane these spots.

I can well remember during my novitiate in the Coffee districts, having, from sheer ignorance of how seriously I was offending, felled a tree on one of these sacred places for the sake of its timber, and being pounced upon by the custodian of the temple in the form of an elaborately dressed Hindoo lady, who first of all abashed and confounded me with a torrent of choice abuse in the Malayalam language, and then demanded the handing over to her, under threat of legal proceedings, of a certain number of rupees, which I was only too fain to do, and thus prevent further trouble. Needless to say, this was my first and last incoelastoc offence.

In each of these romantic spots, and in close proximity to the stone idol, is sure to be found a group or the lovely *Caryota urens* waving their graceful fronds and, as it were, watching and guarding the natives as they come to worship. Amongst the stones, Ferns of various species have taken hold naturally, but giving the impression that they have been placed there by the hand of man.

This Palm, together with its congener, *Caryota sebolifera*, is used in England in subtropical gardening, but not to the extent that its graceful beauty would justify. I would dearly like to see a group of this Palm arranged on an English lawn similar to those I have so often stood and admired in the wilds of Malabar.—J. LAWRIE.—*Gardeners' Chronicle*, April 2.

JAMAICA GINGER.

One of the most readable papers which we have seen for a long time is printed in the current issue of the *American Journal of Pharmacy*. It is entitled "In the Land of Ginger," and is written by Mr.

F. B. Kilmer, who has resided in Jamaica for several years. It contains the most graphic account of ginger planting and harvesting which has been printed for many years, and from it we draw the following particulars. Between 25,000 and 50,000 of the Jamaica population depend for their living upon the ginger-crop. The ginger is of two kinds—"blue" and "yellow"—but the plants are botanically indistinguishable; the "yellow" is the better root, being brittle, and more pungent than the "blue," which is tough and fibrous. These, again, are subdivided into "plant" and "ratoon" ginger—the former is ginger planted each season, and the latter is a return crop, secured by leaving a part of the rhizome in the ground at the harvest-time. Ginger is planted in March and April. Pieces of the rhizome, each with an "eye," are planted. Few planters have settled farms; they clear a piece of the forest, burn the weeds, and plough the soil a little, then do the planting. When once in the ground the plant appears to require little attention, except that it must be well watered, and as there is an abundant rainfall in Jamaica no labour in this direction is required. Attempts are rarely made to fertilise the plant, manure being scarce in Jamaica, as there are no stables. The most that is done is to plough in the weeds and cover the ground with banana waste. As an experiment, watering the beds with sea-water and sea-weeds has yielded good results; but the average planter is quite indifferent to scientific cultivation, and this is bad for him, because the soil is impoverished by a few ginger-crops and "dried-up streams, general barrenness—in fact, a wilderness—marks the progress of ginger-culture." The deep-black soil of the virgin forest is where the best quality is produced, and to grow ginger under this condition involves the destruction of large areas of woodlands by fire. This burning is considered of great importance, as potash and other mineral matters contained in the ashes are deposited to sweeten the ground, while the fire also destroys insect pests. In consequence of the many thousands of acres of land destroyed and abandoned in this manner in Jamaica, the local Agricultural Society has been at work since 1895 on worn-out land, and with the aid of suitable artificial manures have had very encouraging results in reclaiming the land. The Society is extending their operations by securing larger plots and giving aid to planters by furnishing manures, &c. The "ginger season," or harvest, is from March to January. When the stalk withers and the bloom has departed, the rhizomes are twisted out of the ground with a fork, and operation which takes long practice to become expert in. After the soil and fibrous roots have been removed, the root-stalk is thrown into water, when it is ready for the peeling-operation. "Peeling-matches," in which the planter gets all his friends to join, are a time of much merry-making in the sable community. The peeling is mostly done by experts with the aid of a simple knife. So far peeling-machinery has been a complete failure. The operation is an all-important one, as may be seen from examination of a transverse section of ginger. First there is an outer striated skin, under which are numerous layers of thin-walled cork cells. The oil contained in these cells in fresh specimens is very pungent, exceedingly aromatic, and almost colourless. As this corky layer contains the greatest amount of oil and resin cells, the deeper the peeling is made so much more of these substances are carried away with the

epidermis. When peeled, the roots are thrown into water and washed; the purer the water the whiter is the product. Sometimes limejuice is used in the wash-water, which gives a whiter root, but as the lime-juice contains saccharine matter and pectose, it prevents drying, and mildew follows. After washing, the rhizomes are dried in the sun, and in from six to eight days they become thoroughly dry. At sunrise the ginger is put out upon a barbeque (platform of stone or concrete), turned over at mid-day, and taken in at sunset. The average loss of weight by drying is nearly 70 per cent. Experiments have been made with calcium chloride as a drying-agent, but the result was not equal to the native method, and the same may also be said of American fruit-evaporators, in which wood is used as the source of heat. It has been asserted that it is a common practice to bleach ginger with the fumes of chlorine or sulphurous acid, but Mr. Kilmer states that no instance of it is known in Jamaica, as the planters are unintelligent, and are opposed through prejudice to innovations. Mr. Kilmer tried chlorine gas as a bleaching-agent, but the product was of a dirty yellow colour. When the crop is fully dried it is carried, mostly by women, to the place of sale, which may be from five to forty miles distant. Here it is sold by the "heap," not by measure or weight. A "heap" of ginger varies considerably, according to the law of supply and demand. If the "hands" are finely shaped and large, there are fewer in the heap; if small, dark, and snarly, the pile is made larger. Should the price of ginger in London or New York advance it is because the heaps in Jamaica have been diminished, and should the price go down the heaps have become larger. The exporters of ginger assort the produce into four or five grades, the highest being the large-sized hands of light and uniform colour, the lowest being the ratoon finger sorts, which are small, soft, and lacking flavour. Some of the hands weigh as much as 8 oz. The amount of ginger exported from the island during the last ten years was as follows:—

lbs.		lbs.	
1887	1,121,827	1892	1,822,531
1888	1,141,877	1893	1,526,884
1889	1,002,633	1894	1,672,384
1890 ½ year	554,193	1895	1,736,460
1891	1,219,197	1896	1,960,609

Half of this goes to the United States. An average crop may be estimated at from 1,000 to 1,500 lbs. dried ginger per acre, and in some cases 2,000 lbs. As already mentioned, the Jamaica Agricultural Society is improving the methods of cultivation by fertilisation, and from information recently to hand it is predicted that the crop now about to be gathered will probably be a record one, partly due to an abundant rainfall. This will mean lower prices for the ginger-planter.—*The Chemist and Druggist.*

BEANS: A FEW PRACTICAL SUGGESTIONS FOR THEIR CULTIVATION AND UTILISATION.

The very mention of the word "Beans" makes the mouths of sea-faring men (yankees in partioular) water as they think of the delicious pork nestling in its steaming bed of 'baked beans,' a delicacy seldom dreamed of by shore-folk on the east of the huge Atlantic.

To the medical mind the word is associated with the recollection of several drugs, such as Calabar bean, St Ignatius bean, Malacca and Carthagena beans, and a number of other vegetables whose only resemblance to the true bean or *faba* was either the shape of the seed or the fact of the seed having been enclosed in a seed-pod and to which the affix *faba* (meaning to feed) had been erroneously fitted.

An attempt has also been made by some authorities to include Soja Hispida, Cajanus, Dholls, the flat varieties of peas and many of the lentil family under the generic name of beans; simply because they, like beans, have been called and dietetically spoken of as 'pulses' and pulses embrace an enormous group of farinaceous seeds such as peas, lentils, maize, dholls, beans etc., all of which contain a large proportion of nitrogenous matter for avail by the animal creation.

But such a classification is erroneous in the extreme; as these several plants *materially* differ not only in their constitution, life-history, and botanical standing, but also in the chemical composition of their seeds, as may be seen by the subjoined table which shows the percentage of the various constituents of the flour obtained by pulverising the mature dry seeds.

Kind of Pulse.	Nitrogenous matters.	Starchy matters.	Fat.	Mineral matters.	Water.
Kidney bean	26.9	49.9	2.0	4.946	16.0
French bean	27.3	48.84	2.0	5.212	13.5
Broad bean	27.00	52.6	1.6	5.08	12.8
Soja Hispida	38.83	26.65	1.51	4.14	10.25
Dolichos	23.27	59.38	2.20	3.19	12.03
Musoor Dholl	25.15	59.85	1.26	1.92	11.84
Lentils	25.2	58.4	2.6	2.3	11.5
Pisum Satiumum	27.96	56.36	1.47	2.48	11.79
Cajanus Indica	22.18	62.13	1.95	3.11	10.63

One of the most prolific of the vegetable world and almost the most useful as a food stuff, but yet the most neglected in India, is the Bean of which there are more than four hundred varieties, all of which however belong to the natural order *Leguminosæ* of the class *Diadelphica* and the order *Decandria*.

USES

The leaves, legumes and seeds are freely used as delicacies in company with meat or rice, in the shape of boiled vegetables, greens and curries; but the dried seeds are not largely indulged in as human food nor do the Indians live on them exclusively for the simple reason that the crops sown are not very extensive and the supply of the nearly matured or young beans is in no way equal to the market demand for them.

As a cattle food, the *Dolichos Ghotwal* is the only one of the bean tribes that is popular; but even then this popularity does not extend beyond the Madras Presidency and the Mysore, Coorg and Carnatic Districts; because of the caste prejudices of the people who adhere to whatever their forefathers did in the way of stock-raising and foddering cattle.

The flowers contain considerable amounts of saccharine and starchy matter which might be turned to advantage for the production of alcohol or ensilage; but they are allowed to go waste in most places. The *Todas*, however, a semi wild tribe occupying some of the forest-lands in the Nilgherries collect the flowers of the wild varieties, mix them with various herbs and berries, add sugar and water, and from this mixture, prepare a kind of mild *arrack* by fermentation.

The leaves and stems which are rich in soluble salts make excellent fodder for cattle and might be stored up as such; but with the usual wastefulness

of the ryot they are thrown away or perchance left to rot on the fields for manuring purposes; a bad proceeding as the manure value they return to the soil could easily be added at very little expense—certainly not a fiftieth of the commercial loss sustained by the non-utilisation of these stems and leaves.

The *chlorophyll* from the green leaves and unripe legumes is pretty largely used to impart a fine green colour to sweetmeats and other toothsome delicacies, but it is not extracted to any commercial extent; and during this extraction of the coloring matter by the sweetmeat manufactures, a great deal of valuable matter in the shape of starch and sugar is lost.

Bean flour has frequently been used for the adulteration of wheaten flour, but the cheat can readily be detected by throwing a little of the suspected meal into boiling water when the peculiar smell of the bean flour is almost instantly apparent, if it has been used.

Any doubt, however, can be easily removed by the aid of the microscope; for while the meshes of bean cellulose are very much larger than those of the fourth coat of wheat, the starch, which belongs to (class II. to which also belong the pea, dari and maize) is quite distinct and is composed of oblong oval (rarely reniform) granules, averaging 0.00135 inch, long diameter, and in which concentric rings or layers are all but invisible and the hilum is stellate.

Alcohol is not recovered from beans in India, but on the continent of Europe a very brisk trade is done in this commodity which afterwards finds its way to India in the form of cheap spirits and very often as the menstruum of the so-called No. 1 Brandy and Whisky.

Starch.—Laboratory experiments prove that starch of an excellent quality may be recovered from beans in precisely the same mode as from wheat and other grains, but lack of energy and the extreme difficulty to secure capital for plant and necessary machinery combine to prevent this useful substance assuming commercial proportions, and in this way no encouragement is held out towards the cultivation of beans.

CULTIVATION.

Season for planting.—Indian or country beans should be sown at the beginning of the second week of May and so also many of the varieties of *Dolichos* and *eryum*; but creeping or runner beans such as the broad bean and scarlet runner etc. should not be put down before July, while English and French beans, kidneys and the delicate sorts of *Phaseolus* and *Vicia* may be sown at any time during October to December, yet far more healthy plants and luxuriant crops are obtained when the planting is done immediately after the cessation of the rains.

The reason why sowing should not be done within the rainy season is that as soon as a seed begins to sprout it depends for existence on the starch and gluten stored up in the cotyledons which under the influence of *sufficient* moisture are respectively converted into sugar and diastase and the latter helps the sap of the tender plant to dissolve, and utilise the starch; but under the influence of excessive moisture the farina expanding too rapidly, germination is pushed forward *long* before its proper time and weak, unhealthy plants are the result or the continued action of the water on the seed may so thoroughly rot it as to utterly prevent germination.

Sowing, as it is done by the ryots, is a mistake because they cast the seeds on to the fields where the birds pick up a good quantity and a considerable number get destroyed by the action of the sun and air, while of the 60 or 70 per cent. that do find their way into the ground, about another 5 to 10 per cent are choked up by the time the plumules shoot out by having been cast too closely together; besides this too, little attention is paid to the condition of the soil or to the proper rotation of crops.

Soils not only sustain the plant in an erect position and afford it food but also are the medium of the various chemical actions necessary to the preparation of the proximate principles of which plants are built up.

No matter what part they are destined to play in the economy of nature or how diverse their appearance, structure and life-history, the whole of the vegetable world is composed of the same *organic* elements in varying proportions and from 2 to 9 per cent of *inorganic* matter of which the greater part consists of varying proportion of alumina, the alkalies, iron and silica in combination with carbon dioxide, chlorine, vitriol, and phosphoric acid.

Now as the organic matter is derived partly from the air and partly from the ground, while the *whole* of the inorganic substances are obtained *solely* from the earth, it stands to reason that the soil should bear a distinct relation to the substances composing the plant it is required to sustain, and any excess or deficiency of any necessary constituent must be compensated or regulated, if we wish to have successful crops and healthy fruitful plants.

Due allowance must also be made for the impoverishing action that plants exert on the soil by abstracting from it various important constituents that they require for their own nutrition and development.

By studying the subjoined analysis of the common bean (*Phaseolus vulgaris*) and remembering that the constitution of various plants depends greatly on the materials on which they are constructed the reader will understand the loss the ground must suffer.

Phaseolus Vulgaris,	Roots,	Leaves and Stems,	Seed.
Organic matter	80.74	74.46	78.80
Water	14.21	19.28	16.09
Percentage of ash (i.e. minerals)	2.86	2.01	2.51
100 parts of such as will contain:—			
Carbonic acid	1.79	1.20	1.63
Chlorine	2.15	1.56	1.96
Iron sesquioxide	0.72	0.52	0.65
Lime	13.26	9.65	12.06
Magnesia	6.60	4.80	6.00
Phosphoric acid	37.11	26.99	33.71
Potash	40.39	29.38	36.72
Silica	1.67	1.22	1.52
Soda	1.53	1.25	1.44
Sulphuric acid	3.65	3.32	4.28

Or in other words every maund (i.e., 80 lbs.) weight of bean-plants raised, denuded the ground of the quantity of material shewn in column A of the following table in which the figures under B represent the amount restored by the Indian system of burning such part of the stems &c., as they do not otherwise utilise and scattering the ashes over the ground. Column C gives the loss *still* sustained.

	A.	B.	C.
Carbonic acid	0.045	0.008	0.037
Chlorine	0.056	0.022	0.034
Iron sesquioxide	0.018	0.007	0.011
Lime	0.349	0.139	0.277
Magnesia	0.174	0.068	0.106
Organic Matter	60.840	24.920	35.920
Phosphoric acid	0.928	0.371	0.557
Potash	1.064	0.425	0.639
Silica	0.044	0.017	0.027
Sulphuric acid	0.112	0.044	0.078
Soda	0.042	0.016	0.026
Total in lb.	63.672	26.037	37.635

Suppose this was allowed to go on year after year and nothing were done to remedy the loss in some scientific mode, the most fertile ground would be rendered perfectly barren as may be seen by the

subjoined statement of the average composition of some of the Indian soils.

Source of soil :—	Calcutta.			
	Ootacamund	Bangalore.	Town.	Suburbs.
Reference numbers.	1	2	3	4
Fine earthy and organic matter	92.82	85.42	62.16	84.26
Sand and silicates	4.95	13.62	37.61	15.43
Soluble saline matter	2.23	0.96	0.20	0.31
109 parts of this fine earthy and organic matter contained :—				
Alumina	5.97	5.92	8.87	5.01
Ammonia	0.14	0.09	0.06	trace.
Carbonic acid	4.62	3.92	0.12	2.21
Chlorine	2.01	1.99	0.11	0.23
Iron oxide	5.94	4.84	6.26	3.08

Soda	0.31	0.42	0.09	0.24
Sulphuric acid	0.24	0.21	trace	0.07
Water and loss	8.08	5.47	0.09	1.98

No. 1 is an exceedingly rich soil that would easily give three successive bean-crops without requiring to be manured. No. 2 is also a fertile soil needing however a little toning. No. 3 has too much lime and is deficient in soluble salts and organic matter while No. 4 which would be a capital soil for floriculture requires to be brought up to standard in its lime and the soluble alkalies before it can be successfully used for vegetables.

Here then comes the necessity for the reciprocity of labour between the cultivator and the chemist; for without the assistance of the latter is merely impossible for the former to judge with any degree of certainty as to what is really in excess or deficit, and in nine cases out of ten a heap of good money is thrown away in purchasing a manure that does not happen to be what was really needed.

Damp land being generally unproductive, efficient draining is necessary and is greatly helped by ploughing, but after the land has been drained there is nothing to equal deep-ploughing to bring new mineral manure to the surface and in very many cases this alone works marvels with supposed fallow-land.

If, however, manuring is necessary, the farmer must consider the sort of crop he intends to sow and regulate the manure accordingly from :—

(1) *Animal* manures such as blood, muscle, bones, horn, hair, wool, stable droppings and farm ordure, pigeons, dung guano, urine, sewage and night soil; but though the last is the most valuable it is not approved of by the Indian cultivator.

(2) *Mineral* manures as marl, lime, shell-sand, gypsum, salt, kelp, sulphate of magnesia, glauber's, salts, chloride of potassium, nitres, gas liquors, mixtures of saline manures with each other or with animal manures, and a number of patents.

(3) *Vegetable* manures which may be applied green or dry. Among these are sea-weeds, mill-siftings and sweepings, saw-dust, straw, husks, charcoal powder, tanner's waste, barks, &c.

Animal manures are the most energetic on account of the nitrogen and ammoniacal salts they contain, and green vegetable matter yields a speedy supply of food to the growing plants, by under going rapid decay; but dry vegetable manures act more permanently on the ground and mineral manures, if applied with special reference to the constitution of the soil they are required to improve or renovate, tend to early harvests with a plentiful yield and perfect fruit and seeds.

But though the farmer has a large variety of materials to choose from, he is perfectly helpless and runs the risk not only of spoiling his land and damaging his crops but also losing a large amount of money by studying the false economy of 'dodging the Chemist' out of his Rs. 6 to 10 as. analytical fee, and spending R40 to R100 in buying the wrong sort of manure, to thus depreciate his crop by perhaps three or four thousand rupees.

There is a huge volume of truth in the adage "Each to his own trade or profession; but no poaching on others' provinces" and if the cultivators would only combine to pay Rs. 6 per annum per capita, they could maintain a first class agricultural chemical laboratory that would save them from the loss of thousands of rupees on the purchase of useless materials and on futile experiments.

The following table gives the cost, composition and relative value for hundred-weight of the most reliable 'quick' manures, and they are available in very large quantities in India

Constitution of :—	Humus or Leaf mould.	Bones.	Sewage or Foudrette.	Triplice.													
					Alumina	Ammonia	Carbonic acid	Chlorine	Fluorine	Iron Salts	Lime	Magnesia	Manganese	Organic matter	Other salts	Phosphoric acid	Potash
Alumina	1.94	1.93	0.98	2.58													
Ammonia	2.29	2.67	7.37	6.24													
Carbonic acid	7.42	4.95	6.08	5.48													
Chlorine	1.21	0.22	6.84	0.54													
Fluorine	0.07	0.48	nil	0.79													
Iron Salts	1.98	1.19	2.44	10.07													
Lime	6.27	25.17	0.95	20.68													
Magnesia	0.59	1.04	0.59	1.51													
Manganese	0.16	0.45	0.09	0.64													
Organic matter	28.33	22.07	56.85	22.81													
Other salts	22.49	0.84	1.32	1.09													
Phosphoric acid	2.14	41.08	1.93	20.74

Siliceous matter	8.53	2.21	2.25	10.90													
Soda	2.66	0.76	4.06	1.18													
Sulphuric acid	0.96	0.64	6.62	2.92													
Undetermined Solids	1.26	0.35	0.79	Nil													
Water or moisture	42.23	8.50	9.98	1.14													
Easily soluble and ready for immediate avail	28.79	22.91	25.22	27.09													
Slowly dissolved and for permanent effect	12.46	73.80	74.99	80.85													
Cost per cent. Rs.	1½	3½	9	6													
Relative quantity wanted in cwt.	8	3½	1½	1													
Therefore actual costs on equal conditions Rs.	12	11½	12	6													

Sowing:—Two methods are suggested (a) direct sowing by casting the prepared seed into furrows 2 to 3 inches deep and (b) transplanting after the plumule has grown to nearly two inches high and the cotyledon leaves have dropped off or are about to fall off; but while in the first case it is wisest to 'cast' through a cocoanut-shell or wooden ladle drilled with an inferior hole just large enough to let the seeds run through in a very thin stream, in the latter form the plants should not be placed closer than six inches apart.

Preparing the seed:—If a rough examination show the presence of weevils, a thin sheet of vapour of bisulphide of carbon passed through the seed-boxes will soon get rid of these pests; but the seed will have to be aired for at least three hours in a moderately warm place to drive off the sulphide vapours before submission to the next process which consists in throwing them into cisterns carrying water containing corrosive sublimate in the proportion of one grain to the gallon of water. Here they remain for 24 hours so as to give the good seeds germinating impetus and float off the unsound ones, as well as to protect them from mould and ground larvæ.

The seeds for direct planting are shovelled into the aprons of the 'sowers' for 'casting' while those intended for transplanting are transferred to nursery beds and lightly covered over with sand containing a small percentage of the soil in which they are to be afterwards placed. Here they are watered twice a day till the

cotyledons rise half-way out of the ground, when the watering should not exceed once daily (gradually decreased, after planting out, to once in two days). This watering should be done with a rose-tipped can, and where available a spray is preferable. A mild day should be chosen for the transplanting during which at least one inch of the stem should be buried with the roots and the earth lightly pressed in. Begin in the afternoon and work on till sun down, so as to give the young plants all night to recover from the shock, and if they sicken, (as they will do for the first three or four days), sprinkle them with water containing nearly 0.001 per cent. of nitre which is a wonderful pick-me-up. When the plants begin to flower, lessen the water-supply and altogether stop when the bean-pods mature.

When the plants of the running or climbing varieties are nearly five inches high, supply them with climbing fences made of any kind of slender twigs that may be cheapest obtainable in a dry condition; but on no account resort to bamboo fencing which is apt to become a breeding pen for innumerable destructive insects and is particularly liable to a fungous disease which is fatal to bean plants.

Regularly overhaul the bean beds for slugs and caterpillars, and if the roots are at all denuded, earth them, taking care not to wound the roots. If the immature (*i.e.* young) beans are required for table, go over the beds carefully and snip off (do not pull) those only whose legumes are at least three-fourths ready for seeding, and do not water the plants on that day.

Harvest is betokened by the leaves beginning to fall off and the legumes, losing their chlorophyll, becoming pale and dry rapidly; and if ungarnered they will burst and discharge their contents on the ground. This must be guarded against by sending men into the fields with large huckster baskets into which are thrown the plants as fast as they are rooted up.

Those plants whose pods are not fully matured are left standing for two, three or more days till they do mature, and a practised hand will lose very few beans during the process of "jerking" (*i.e.* uprooting) the plant out of the ground.

Those beans that are required for a future sowing are allowed to "tree ripe," *i.e.* get thoroughly dry on the living plant before they are gathered.

Now remove the huckster panniers to a place where the floor is properly *laped* (plastered with cow-dung mixed with clay) and swept clean. On this empty the contents of the panniers till a heap of nearly two feet high is obtained. Then this heap is to be turned over four or five times for two days or more under a hot sun, so as to dry it and help to burst the pods. The thresh the bean seeds out with flails or by making cattle or men run to and fro over the heap and then winnow off the shreds of husk.

Storing:—The beans thus harvested may be packed in two mannd (*i.e.* 160 lb.) sacks, which, until they are wanted for market, should be kept on some elevated and dry place to guard against the ravages of rats and protect them from getting damped and spoiled. Or they may be immediately bulked in iron tanks whose mouths should be sealed down to keep out weevils and other insects.

The seed-beans should be thoroughly dried and then placed in bottles or earthen jars, which after being closely stoppered and sealed ought to be stowed away (till sowing time) in a moderately warm but *dark* place.

The bean straw may be used as cattle fodder and the roots and harder portions of the stems should be thrown into a pit, covered over with about a foot of earth and daily moistened with water and stable fluids, so that, by the time next ploughing season comes round, they will have decomposed into an extremely valuable and highly fertilising top-dressing for the next crop, which should preferably be of oats or barley.

Pay particular attention to the nature of the soil and the *proper* rotation of crops, always remembering that the same kind of crop should not be raised on the same ground for two or more successive seasons,—no matter how rich the original soil—without fresh manuring.

ROGER S. CHEW, M.D., C.M., M.S.C.

LIBERIAN COFFEE AND INSECT PESTS.

H.E. THE GOVERNOR, WINDWARD ISLANDS, TO THE SECRETARY OF STATE FOR THE COLONIES.

GRENADA, 4th December, 1897.

Sir,—I have the honour to transmit an extract from a letter I received on the 25th ultimo from Mr. G. Whitfield Smith, of this Colony, on the subject of the injury done here to Liberian coffee by a scale insect, some of which, on diseased leaves, I enclose for examination and report. I am collecting specimens of this insect in all its stages for identification.

2. Heretofore Liberian coffee has been looked upon as proof against any blight or insect attack. In view of its wide culture in every part of the world, it would be indeed a sad awakening to find the contrary.

3. In 1875 some trees are Liberian coffee, in its home, Liberia were affected by the *Hemileia vastatrix*. The effect was similar to what is described by Mr. Whitfield Smith. As regards the trees here, no extensive injury was experienced, nor have I heard since of any loss from the like cause.

4. May I invite a reference on this important matter to the Director, Royal Gardens Kew.—I have, etc., ALFRED MOLONEY, Governer.

EXTRACT FROM A LETTER FROM MR. G. WHITFIELD SMITH TO THE GOVERNOR, DATED 24TH NOVEMBER, 1897

—"I also forwarded some diseased Liberian coffee leaves. As Your Excellency will observe, these are attacked by a scale insect. When I first noticed it, some months ago, it was very scattered and seem to do little harm, but of late it has spread rapidly, and now seriously affects the health of the trees. It occurs on plants growing in the open as well as on those under shade and the trees attacked gradually lose their branches. Hitherto Liberian coffee has been considered proof against insect pests, and I thought Your Excellency would like to know of this, especially as there is a chance of the disease becoming a serious evil if it finds a suitable object of attack in the Liberian coffee."

DIRECTOR, ROYAL GARDENS, KEW, TO C. P. LUCAS, ESQ., COLONIAL OFFICE, LONDON.

Royal Gardens, Kew, 12th January, 1898.

Sir,—I have the honour to acknowledge the receipt of your letter of December 30th (2739/97) enclosing copy of a despatch from the Governor of the Windward Islands with specimens of diseased leaves of Liberian coffee. 2. On examination here it was found that these leaves exhibited no trace of "coffee-leaf disease" (*Hemileia vastatrix*) or of any other fungus. 3. I observe that in the 3rd paragraph of his despatch Sir Alfred Moloney makes the following statement:—"In 1875 some trees of Liberian coffee, in its home, Liberia, were affected by the *Hemileia vastatrix*. The effect was similar to what is described by Mr. Whitfield Smith," *i.e.*, apparently to that exhibited by the diseased leaves accompanying the despatch. 4. As the matter is of great importance I may say at once that the effect is not in the least similar. The Coffee-leaf disease is a fungus which speedily destroys the tissues of the leaf and causes it to fall prematurely. The Grenada Liberian coffee, on the other hand, as Mr. Whitfield Smith correctly states, is "attacked by a scale insect." As a matter of fact, two distinct kinds have been detected:—(1) The circular scale, *Aspidiotus articulatus*, which is also found on the West Coast of Africa (Lagos); (2) the long narrow scale, chiefly on the ribs of the leaves, *Ischnaspia filiformis*, which is very common in the West Indies and is also found in England. 5. These scale insects, though no doubt injurious, are not to be compared for a moment as a source of danger to coffee cultivation to the coffee-leaf disease. You are aware that the progress and distribution throughout the world of this scourge to coffee cultivation has been watched by Kew with assiduous care. Originating about 1869 in Ceylon it spread to the Malayan Archipelago in 1876, to Fiji in 1879, to Mauritius in 1881, to Natal in 1891 ("Kew Bulletin," 1893

p. 362), and to German East Africa in 1894. But, as I stated in my letter of 16th December, 1896, it is not known to exist in the West Africa Colonies. Added to this, Liberian coffee is found to be only moderately affected by it. I cannot but think, therefore, that all probability is opposed to the correctness of Sir Alfred Moloney's statement that the disease existed in Liberia in 1875, as Eastern Africa was not affected till nearly ten years later. I should be glad to know on what precise evidence Sir Alfred Moloney bases it. If true, it seals the fate of coffee cultivation on the West Coast and seriously imperils that in the new world. 6. I enclose a memorandum of the most approved method of treatment for dealing with scale insects. 7. A honorarium of one guinea (£1 ls.) is due to Mr. W. F. Blandford (whose address is 48, Wimpole Street, W.) for his assistance in the matter.—I am, etc., W. T. THISELTON DYER.

MIXTURE FOR DESTROYING SCALE INSECTS.

Heat milk nearly to boiling point and mix with double the quantity of kerosene; stir briskly until a thick creamy liquid is obtained. Dilute with ten times the quantity of water. Spray or apply with a brush, keeping the mixture constantly stirred.

Sour milk is as efficient as fresh.

If milk cannot be obtained, or if the mixture is required in large quantity, a strong soap emulsion may be used in its place.

COPY OF MINUTE BY THE DIRECTOR OF GARDENS,
SINGAPORE.

Hon. Colonial Secretary.

The scale insect is by no means rare here on Liberian coffee. It is usually a sign of weakness of the plant from want of nourishment. Liberian coffee is liable to a great many kinds of insect and fungus pests.—H. N. R.,—*Selangor Government Gazette*.

ANOTHER COFFEE PEST.

I am afraid from what I see and hear, that a good deal of harm has been done to our coffee in more districts than one in a new way. The underside of the leaf becomes of a reddish tinge, it spreads rapidly, and soon affects the whole vitality of the coffee bush. I have pointed out to many fellow-planters, that where you have this, you have invariably a very small greenish white, louse-like insect. It has been maintained by some, that the injury must be caused by a fungus, (it is certainly not the *Hemileia vastatrix*.) but I contend that the original damage is done by this insect. I have several times observed a rather larger, dark grey insect in the same leaves, and I was almost sure from the first, that these were thrips. They are a little different from any of which I have the description. But I am now satisfied that the little white lice are the larvæ of thrips, and that this particular thrips has acquired such a liking for our coffee, that planters will have to fight him seriously. He can be killed by soap solutions, say one pound to 7 or 8 gallons; but a better cure where tobacco is so cheap would be:

1 or 2 lbs. Tobacco.

1 lb. soft soap, or common soap.

20 gals. water.

The soap should be cut into shavings and boiled, or dissolved in boiling water. The tobacco boiled separately and strained.

Unfortunately the thrips prefer the underside of the leaves so that a syringe that would throw upwards in a fine spray is necessary. Better still, a spraying pump, such as is used in the American Orchards. This can be used to throw from the ground a fine mist-like spray that reaches practically every leaf. A brush might also be used to sprinkle these liquids.

I send you a slide with these thrips mounted for the microscope. A couple of big, roundish insects are only aphidos, which do no mischief to coffee, as far as I know. A mature thrips is on one side—the hairy wings mark it off from the others, and a number of the larvæ are also shown. There seem very few mature thrips on the coffee at present.

I trust that this notice may induce correspondence on the subject.—JOHN W. MOIR.—*Central African Times*.

NITRATES IN THE SOIL.

As soil fertility is of so much importance to horticulturists, and as the productiveness of a soil is directly proportionate to the amount of nitrates which it contains, and the facilities or favourable conditions presented for the conversion of organic nitrogen into ammonia and nitrates, the subject of nitrification becomes one of intense interest to all cultivators of the soil.

Nitre or saltpetre is a compound of nitrogen, which represents the form of combination in which nitrogen must be in order that plants may use it as food. The organic nitrogen of the soil, called its inherent fertility, as well as that contained in such fertilising matters as stable or yard-manure, dried blood, fish scraps, rape-cake, vegetable and animal-refuse, &c., is not in a condition to serve as plant-food. To become available it must be converted first into ammonia and then into nitric acid.

All nitrates are formed in the soil through the agency of small microbes or living organisms called bacteria, which require certain conditions for their proper growth and development. These requirements may thus be briefly stated: air or oxygen, a due amount of moisture, a proper temperature, that ranging from 95° to 100° Fahr. being considered the best; phosphates and other ash ingredients of plants, a mild alkali, such as carbonate of lime (chalk); and organic matter (humus) containing nitrogen. Shade is favourable to soil nitrification. The germs themselves are in greater or less numbers in all cultivated soils, and in order for a soil to furnish the conditions necessary, as enumerated above, it must be loose and porous, so as to admit atmospheric air freely; it must be well drained, and have good capillary action, so that at all seasons it will, as nearly as possible, contain that amount of moisture about it which is present when ground digs well, as this is found to be the degree of moisture most desirable. The soil should have plenty of organic matter (humus) within it to furnish nitrogen, and favourably influence the supply of water. For this reason horticulturists find leaf-mould, pasture-turf soils, and peat soils so beneficial for plant-growing. Soils deficient in the nitric ferment germs or bacteria are barren, while those which furnish conditions favourable for nitrification, such as those enumerated above, are always fertile. The total quantity of nitrates formed in a fertile soil is considerable. Experiments have shown that they may range from 75 lb. per acre in an unmanured soil, to about 125 lb. per acre in a soil to which farmyard manure has recently been applied. But it may be well to note that the whole of this nitrogen is not available to our ordinary cultivated crops, for the reason that many of them only assimilate the spring or early summer nitrates, the principal growth and power of assimilation having ceased by the month of July. Vegetable crops, such as Cabbage, Beet, Onions, Turnips, Carrots, Parsnips, Celery, &c., may still get hold of summer nitrates, but the nitrates produced in late autumn and winter are of little use, in so far as this applies to outdoor plants. The spring nitrification of a soil alone is, as a rule, quite insufficient for the requirement of early-spring plants, hence the advisability of using some stimulating manure, if very early production of vegetables is desired.—J. J. WILLIS, Harpenden.—*Gardeners' Chronicle*.

WATERPROOFING CANVAS.—The following are to be recommended:—(1) Good boiled oil coloured with a little lampblack or yellow ochre applied to the canvas when damp, and allowed to dry in a cool draught. (2) 1 gal. of boiled linseed oil, $\frac{1}{2}$ lb. of common yellow soap, 6 lb. of yellow ochre, and 3 oz. of terebinte. Dissolve the soap, cut in shreds, in about 1 qt. of boiling water, add the other ingredients, and boil together. Stir well to get thoroughly mixed while hot, and allow to cool before applying. Give two or three coats. (3) Litharge in the proportion of 1 oz. to 1 gal. of linseed oil boiled together with some colouring pigment for twenty hours. (4) For purposes where cleanliness is no object, tarpaulin canvas dressed with Stockholm tar is waterproof and pliable, but always more or less sticky.—*Work*, for April,

PROGRESS IN PLANTING.

As some of the first fruits of the compilation for our Directory we present our readers below, with a summary of the area of land held and cultivated on behalf of the various Companies represented in the island by Messrs. Finlay, Muir & Co. The total includes the present season's clearings, and it will be observed that there are 15,792 acres of tea and 1,088 acres of cacao; besides 4,000 acres under the coconut palm (on five different plantations) and 400 acres under Para Rubber. The Companies cannot be said therefore to be keeping all their eggs in one basket or to be neglecting new as well as old products. The detailed figures are as follows:—

	Total acreage.	Cultivated acreage.	Tea acres.	Cacao acres.
East India and Ceylon Tea Co., Ltd. ..	2,680	1,554	1,554	—
Amalgamated Tea Estates Co., Ltd. ..	2,610	1,532	1,338	194
Associated Tea Estates of Ceylon, Ltd. ..	2,789	1,979	1,979	—
Kanan Devan Hills Produce Co., Ltd. ..	1,140	840	810	—
Hopewell Tea Co., Ltd. ..	8,172	3,730	3,730	—
Mahawala Tea Estate Co., Ltd. ..	1,042	622	622	—
Consolidated Tea and Lands, Co., Ltd. ..	11,066	6,623	5,729	894
Total ..	29,499	16,830	15,792	1,088
Rubber (Para)	400	..
Coconuts	4,000	..
Cacao	1,088	..
Total in Cultivation:—Acres: 21,280				

MUSINGS ON THE HILLS: TEA IN HIGH DISTRICTS.

(By Masmos.)

I never visit Nuwara Eliya without regretting that the cultivation of tea should have invaded the Plain. After an almost endless vista of tea all the journey up, one might have been spared the view from most places in the Sanitarium of long lines of green bushes or brown stretches of cleared land. From the top of Pedrotalagala or from Kikilimane, one is scarcely conscious of tea cultivation, because the sense of undisturbed nature becomes so keen; but from 'One Tree Hill,' now called 'Single Tree Hill,' it is very different. Alas that the walk up this should now be entirely through tea, the old jungle walk on the top having been cleared. It is a great pity that any of the charms of Nuwara Eliya should go in this way. How delighted one is when one gets a view of nothing but virgin forest and patana! Then it is

"Nature all, and all delight."

It is a pity, too, that every approach to Nuwara Eliya—from Ramboda, from Kandapola, from Badulla, from Nanuoya—right up to the Plain should suffer from this monotonous intrusion of the commercial idea. The Colombo merchant and the planter are alike robbed of some of the benefits of a holiday, if it is taken here, by constant temptation to talk "shop," and by reminders and suggestions of the work-a-day world they are supposed to have left behind. And even those in other walks of life would be all the better for not being disturbed by anything but

"A Presence that disturbs—with the joy Of elevated thoughts.

I have been reminded, by certain pathetic bits of abandoned land, here and there, of a passage in the writings of Jean Ingelow:—

"Nature, before it has been touched by man, is almost always beautiful, strong and cheerful in man's eyes; but nature, when he has once given it his culture—and then forsaken it,—has usually an air of sorrow and helplessness. He has made it live the more by laying his hand upon it, and touching it with his life. It has come to relish his humanity, and it is so flavoured with his thoughts, and ordered and permeated by his spirit, that if the stimulus of his presence is withdrawn, it cannot for a long time do without him and live for itself as fully and as well as it did before."

A tea estate is not idyllic or poetic, and besides its monotony it has a 'relish' and a 'flavour' of man's life of want and work; but it has a very cheerful look compared with abandoned land, and it is a cause of thankfulness, for aesthetic as well as for commercial reasons, that so much old coffee land has been put into cultivation.* How cheerful the country looks, and how well-ordered and prosperous its life; how the "air of sorrow and helplessness" has left it since tea began its reign amongst the hills. There is a bit of abandoned land just outside Nuwara Eliya that is an almost perfect illustration of Jean Ingelow's thought. It gives back sadness to him who looks at it. Its beauty, blasted appearance suggests that the vegetable world too must have its pessimists. Some distance farther on, the optimism of nature reigns for a long glance down the ravine ends on a glorious bank of forest foliage, variegated to perfection. This morning on looking down I was reminded of Dean Farrar's saying: "Valleys are the aisles in the magnificent temple of God." And so worshipping I went on my way.

In spite of such drawbacks as I have mentioned Nuwara Eliya is a grand place in which to spend a holiday. It will be better still when

CERTAIN IMPROVEMENTS

now much talked of by residents, because much is the increase of taxation, have been effected. There are splendid roads and many of them, and it is no spirit of unthankfulness that makes one wish for an Upper Circular Road at the Ramboda end of the Plain, so that old people and invalids might from the heights enjoy a sight of the place as a whole. How visitors to Kandy enjoy the view from the roads on the hills almost encircling the town, and what glorious prospects would open out in a drive round this place if at an elevation sufficient to take in its beauties. Those

* We had just decided to find fault with "Masmos" for his apparent unthankfulness to tea—which saved Ceylon from comparative "ruin"—when we came on this saving passage. He forgets too the "delicious flavour" of Nuwara Eliya tea above all other teas in the island, as the market shows; and amidst some occasion for grumbling, "Masmos" ought to be specially thankful that tea has not yet invaded the grand and wild expanse of Horton Plains (which ought always to be visited by Nuwara Eliya season residents); while he must also not overlook the really attractive picture presented by the dark green of a matured tea field in or about Nuwara Eliya, in contrast with the varied forest, the whole being framed by the everlasting hills. Most thankful above all ought such lovers of the beauties of nature as "Masmos" to be, for the official rule that nowhere can Crown forest above 5,000 feet be sold for purposes of clearing or cultivation.—ED. T.A.

who have climbed Single Tree Hill and Kikilimane and Pedro (the last I have climbed a dozen times) know how real and varied these are.

And yet another suggestion. At apparently but little cost, two or three romantic walks might be made. There are plenty of young people in Nuwara Eliya in the season to enjoy them, and it is true also to say that here the old feel young. I walked the other evening into the heart of Pedro on the left bank of the stream, the right bank as you ascend, as far as the reservoir; if there had been a walk back on the other side of the stream it would have been perfect. It would not cost very much to make one, probably; especially as the path up Pedro skirts the stream for a good distance. Another pleasant walk would be (but this would somewhat disturb the privacy of the Government Agent's house) a clear path from near the gaol along the hillside to the back of the hospital. Indeed there is a path there already, and by the side of part of it the water supply for Mr. Burrows' house runs. This path might be thrown open with safety when water is laid on to the bungalow. At one point, and about half way, is a waterfall, well worth seeing, and known to a dozen visitors for many years past as the "Gentleman's Waterfall." And the grandest walk of all would be one up a ravine, known to but a few in its entire length, between the Lady's Waterfall and the Bund of the Lake. It is a grand walk, or rather scramble-ramble and climb, even now for gentlemen certainly, and for ladies who are young and strong and when there is not too much water. I know ladies who have done it—with assistance. At one point there has been an earth-slip, by no means recent, and the stream goes underground for a considerable distance. The old bed is covered with ferns and mosses and lichens and flowers. Towards the top and just before the bund is reached the stream runs rather deep and there are no friendly stones to help one along; but bare feet and a little more can easily accomplish it and then one of the most satisfying outings of the Sanitarium has been taken. It might be more difficult than it looks to cut a path on one side of this stream, but if it could be done a most lovely walk it would be. I suppose, however, that Improvement Commissioners do not exist primarily to satisfy the romantic and the nature-loving, and that a Water Supply, Conservancy, Drains &c. must receive the chief attention for some time to come.

[A picnic below the Lady's Waterfall and a scramble afterwards up the course of the stream to the Bund or Lady Horton's Walk used to be part of every season's programme some years ago.—ED. T.A.]

THE RUSSIANS IN MANCHURIA, AND THE OVERLAND TRADE IN TEA.

As regards the OVERLAND TRADE IN TEA BETWEEN CHINA AND RUSSIA, some useful information is afforded by this latest traveller in Manchuria. Mr. Christie in his Report told us that the Russians make a distinction in levying duty on imported tea, the rate on the product brought "overland" being only 1s 2d per lb. against 1s 10½d levied on all tea introduced by sea, or through other European States. Now we cannot suppose that the wish or policy of the Russian Government can really be to choke off the sea-borne traffic; for, such traffic is mostly conveyed in "Russian Volunteer vessels" and it

must surely be the wish of the Czar as of the Kaiser to encourage the development of a mercantile marine. Nevertheless we may be sure that the success of the great railway line from Manchuria to Europe will be very dear to Russian statesmen and the following extract from the London *Times*' Correspondence, indicates how great is the improvement in cost of freight which we must be prepared for when the railway is finished:—

The head of navigation on the Shilka is Stretensk, a town of Jews. It will be the terminus of the Trans-Siberian Railway, and will displace Kiakhta as the centre of the overland tea trade between China and Siberia. The cumbersome transport by camel will be abolished and an important change in commercial trade routes effected. This assumption is based upon the fact that by the Stretensk route after the railway to Irkutsk has been finished, the freight on tea will be reduced one-half. For example:—the freight charges on tea carried from Hankow to Tien-tsin and thence by the overland route through Kalgan and Kiakhta to Irkutsk are, assuming that five camels carry one ton, £20 10s the ton. The same tea sent from Hankow by steamer to Nikolaievsk, by river steamer to Stretensk, and then by train to Irkutsk will pay, assuming that on the railway freight is one penny per ton a mile, £8 a ton.

But Irkutsk is not Europe and the carriage thence added to the £8 a ton specified, should make the total far above anything involved in sea-freight from China, Calcutta or Colombo to Odessa, and therefore if the Russian Government would only deal fairly by imposing a uniform tariff on all tea entering the Empire, the sea-borne trade should certainly carry the day. Perhaps the differential duty is regarded as a slight encouragement to maintain this overland tea trade in the face of the necessarily, very heavy transport charges.

CINNAMON SALES IN LONDON.

The particulars which have come to hand by mail of the Quarterly Cinnamon Sales held in London on the 28th February, fully confirm the advices which were received by wire, and even put a brighter complexion on the position of our spice in the London market. The quantity offered—1,956 Bales—was about 1,110 Bales short of the offerings at the previous sales in November; but February's auctions are always light. Last year the catalogue showed only 1,248 bales, and in February, 1896, the quantity offered was 1,792; so that the first sale for the current year brought to the hammer a decidedly high average quantity. What is more gratifying, especially after the depths to which Cinnamon had sunk, and in which it had remained for years is that this comparatively large offering did not lead to a fall in price. On the contrary there was a brisk demand, and prices indicate an advance, nearly all along the line. The only spice which showed a slight decline was of low coarse sorts which, we fear, is being sent off in increasing quantities from small native gardens, and too often without any care in preparation. We fancy we must go back to the "Seventies" for the prices which Firsts of superior spice fetched—and indeed all four qualities of the better brands—for they ranged from 1s 3d for Fourths, to 1s 11d for Firsts. The advance may probably be explained by the small offerings of superior bark; but fair and medium kinds too shared in an advance of 1d to 2d per lb. over November prices. Comparing the prices which ruled last February with those which obtained

in February, 1897, the improvement is most marked. Thus, dealing with "good and fine" sorts, we make out the prices to compare as under:—

	Firsts.		Seconds.		Thirds.		Fourth	
	s	d	d	s d	d	s d	d	s d
1897 ..	1 to 1	6	11½	to 1 5	10½	to 1 4	10	to 1 1
1898 ..	1 to 1	11	10½	to 1 8	9	to 1 6	8	to 1 3

The above prices suggest carelessness in the preparation of fair and medium bark, the minimum prices comparing unfavourably with those for last year. It cannot be that the demand was slack for other than the best brands; for "unworked" spice—that is quilled Cinnamon which is not resorted and made up again in the London warehouses—also registered an advance on last year's prices. Curiously enough, in chips there was a falling off—the prices having ranged from 2½d to 3½d, against 3½d at the corresponding sales last year.

Altogether, the outlook for Cinnamon seems more hopeful just now than for any other of our staple exports, seeing that prices have advanced or been maintained for four or five years, in the face of increasing exports; but, being a luxury and not an article of diet, there is a limit to the demand, as growers found to their cost during the fifteen to twenty years before the recent improvement in price. Two cautions are necessary:—(1), the avoidance of large extensions; and (2) care in preparation. One safeguard against reckless extensions is to be found in the fact that the preparation of Cinnamon is a caste industry; and that the maintenance of gangs of good peelers is one of the severest trials of planting life. But few Europeans are likely to rush into Cinnamon in any case. The following is the Report of a leading London firm in the trade on the last sales:—

London, 1st March, 1898.

CINNAMON.—The first periodical auctions of the year were held yesterday, when 1,956 bales Ceylon were offered, against 3,090 bales at the November sales, and 1,248 bales in February 1897. There was a full attendance of buyers, and a good demand prevailed, resulting in about 1,500 bales being sold under the hammer at generally improved prices. The greater part of the offering consisted of "unworked" quill with a very large proportion of low coarse cinnamon, while well-known brands of good and fine "worked" plantation spice were in smaller supply than usual.

"Good and Fine" sorts met spirited competition and all sold at an average advance on last November sales' rates of 1d to 2d per lb., while the medium and ordinary kinds mostly realised ½d to 1d per lb. better, except low coarse sorts which frequently ruled cheaper.

"Worked" quill sold, firsts, fair to superior 1s to 1s 11d, seconds, fair to superior 10½d to 1s 8d, thirds medium to superior 9d to 1s 6d, and fourths ordinary to fine 8d to 1s 3d per lb.

"Unworked" (as landed) brought 9d to 1s 2d per lb. for ordinary to good firsts, 7½d to 1s for low to good seconds, 7d to 10½d for low woody to good thirds, and 6d to 8½d per lb. for low to good medium fourths.

CHIPS, &c.—Of about 820 bags offered, 400 bags sold at prices ranging from 2½d to 3½d per lb. according to quality. Quillings and pieces brought from 6½d to 11½d per lb.

Stock of Ceylon—4,193 bales, against 1897, 2,790; 1896, 4,727; and 1895, 3,371 bales.

The next auctions are fixed for 6th June.

FORBES, FORBES & Co., Limited.

THE HORTICULTURAL SHOW IN COLOMBO: POULTRY (AS WELL AS FLOWERS AND FRUIT) TO BE INCLUDED.

The upcountry lady correspondent who suggested the addition of Poultry to the Flowers and Fruit originally proposed for this Show, will—along with many more interested—be very glad to learn that "Poultry" have been included in the draft catalogue. So we are informed by the Honorary Secretary, Mr. C. Driberg, Principal of the Agricultural School. We have no doubt that a full and varied show of poultry will be offered in June, and we trust altogether that the Exhibition will be a success, and the occasion for much innocent recreation, emulation and instruction.

NOTES FROM NORTH-WEST PROVINCE:-- COCONUTS.

Marawila, March 30.

CATERPILLARS.—We, on the Western and North Western sides of the island, do not suffer so much from caterpillar as the good people of Batticaloa, as witness Mr. Green's report. Occasional and partial visitations are not unknown. It will be remembered that some years ago the trees round the Slave Island station were badly affected and I have seen patches of trees affected in this district, but not to such an extent as to cause alarm. The lower leaves alone were affected, while those in the top, which principally perform the important functions of assimilation, were intact. I have never seen or heard of nursery plants or nuts being affected. The suggestion to cut down and burn the affected branches is a very good one, as most of the caterpillars will be burnt before they have been transformed into the active and mischievous moth. I do not think that smoke however dense, even when impregnated with sulphur, will do any good in the open, as the caterpillar is safely entrenched within a kind of cocoon where smoke cannot reach him. Fires at night will do good for the reason which is well-known that they attract moths to their destruction. Little fires at intervals should be very beneficial.

KANGRA TEA PLANTERS AND RAILWAYS AND ROADS.

The Kangra Tea Association has reserved its greatest bid for fortune for another, and it is to be hoped a favourable opportunity. It wants two things both of an imperial nature, and it will not be happy till it gets them. It is anxious to represent them to the Viceroy on the 5th April. One is a railway from Pathankot to Palampur. At present it costs us fourteen annas a maund to send our tea from Palampur to Pathankot, a distance of 71 miles, while from Pathankot to Karachi, a distance of 918 miles, only costs R1-9-9. There is a horrible tax on the industry, absorbing at least fifteen *per cent* of its meagre profits. Nay more, a tax on the entire trade of Kangra, Kulu and Mandi. For a cart road between Palampur and Byjnath—only a skip of ten miles—would join the existing Mandi Cart Road to the former place, and enable the produce of a vast extent of fertile country to be transported to Palampur on wheels instead of on the backs of oxen or the heads of coolies, and therefrom poured out

(let us hope) by railway into the plains. What an opening! The minerals, serials and wool and fruit of Kulu: the salt, timber and grain of Mandi, the wild mountain fibres (many of them valuable if, only transit were cheaper) the tea, the rice, the timber, the charcoal, the slates and the cut stone for building of the Kangra Valley. Not to mention the snow, frozen as solid as ice and a perfect substitute. You can land a maund of snow at Palampur any time in the middle of the hot weather for three annas; given a railway and you shall deliver it at Lahore for six or eight waste excluded. It constituted a brisk trade in the days of Akbar when the snow of the Kangra Hills sold in the bazaar of Lahore for a rupee per seer. Does modern Lahore long less for this luxury than the Lahore of 333 years ago? Are the educated peasantry of the parched plains unable to appreciate it? Would Amritsar fall to use? I have seen a stalwart Jat agriculturalist drink a bottle of iced *belate pani* at a railway station on May, and nothing will induce me to believe he did not like it.

The second thing the Kangra Tea Association wants is the Nushki-Seistan route to Mashhad made clear and safe. To assure this, British Consular Agents at Nasirabad and Seistan are needful to counteract the influence of the Russian agents at those places. The Government of India spends crores of rupees in making ready to fight Russia on our frontiers. To what end? To preserve our possessions and our trade. Shall it not spare a few thousands to compete with Russia in the commercial arena of Central Asia? The new trade route requires developing. It carries us straight to Central Asia. All it wants is British Consular protection to guide it to success.—*Pioneer*.

PARA AND AMAZONIAN RUBBER.

It is stated in a Foreign Office report from Her Majesty's Consul at Para that the total amount of Amazonian rubber exported from Para, Manao, Bolivia, and Peru during the twelve months ended June 30, 1897, was 22,216 tons, of which 12,368 tons were sent to Europe, and 9,848 to the United States. The Amazonian crop during the same period amounted to 22,315 tons, of which 9,100 tons belonged to the State of Para. The amount of Amazonian rubber exported during the year ended Dec. 31, 1896, was 21,597 tons, of which 12,542 tons were sent to Europe (10,637 to the United Kingdom, and 1,905 to France) and 9,055 to the United States; while the amount of Amazonian rubber exported in 1897 (Jan. 1 to Dec. 15) was 20,554 tons, of which only 9,726 tons went to Europe, and 10,828 tons to the United States.

The value of the rubber exports from Para during the year 1896-97 was £1,977,596, and the duties collected on this value amounted to £415,295.

All the trade between States watered by the Amazon (i.e., Para, Amazonas, Peru, and Bolivia) and the United States is purchased in British bottoms; and all the rubber purchased by the United States is paid for through British banks, of which there are three established in Para. A British company—the Amazon steam Navigation Company of London—possess 35 steamers for the navigation of the river Amazon. Over 100 river steamers belong to Para. Most of them were made in England, and merchants in Para, Manao, and Iquitos are continually purchasing others from the same source. Purchases have been made also in the United States, France, and Germany, but the British article is found to be superior.

Rubber of the best quality is produced throughout the continent watered by the Amazon between Para and the Andes mountains of Peru, and the majority of authorities on the subject are of opinion that there

is absolutely no fear for the exhaustion of the supply of rubber in the Amazonian States. Distance and rapids are not insurmountable obstacles, for in some cases this produce is transported as much as 6,000 miles before it reaches Para; and, when rapids impede the way, canoes and their cargoes are hoisted out of the water and rolled along the banks, sometimes for several miles, until navigable water is reached. This causes much delay and additional expense, but it is found in the end that distance and prolonged transportation have improved the rubber, so that when it arrives at its destination it sells for higher prices than that collected nearer the mouth of the river.—*Journal of the Society of Arts*.

COFFEE PLANTING IN THE STRAITS.

Mr. E. V. Carey, formerly well-known in the country, at one time superintendent of Amherst, Udapussellawa, and now in charge of several estates in Selangor, passed through Colombo on Thursday. In the course of a brief conversation with the representative of a contemporary, Mr. Carey gave one or two interesting particulars of the progress of planting in the Straits. He appears to be full of faith in the future of planting there, though the low price now ruling for coffee has, of course, been a great blow to the Liberian coffee industry in that part of the world. Mr. Carey thinks that considerable improvement is capable of being effected in the curing of Liberian, so that it shall occupy a better place in the market relatively to other coffees than it has hitherto done.

"What makes our bean so unpopular with buyers in great measure is the adherence of the silver skin to the bean," said Mr. Carey. "Many of us think this can be overcome by subjecting the parchment to a high temperature artificially, thereby contracting the bean itself before the silver skin has time to adhere to it. Experiments made in this way have shown that the silver skin is so much disliked comes off quite clean, and leaves the bean itself with a grand colour visible."

KILLING OUT THE JUNGLE!

It is to be noticed that planters in the Straits are turning their attention to rubber, and Mr. Carey made several enquiries as to the progress of the cultivation in Ceylon. He told us that the latest suggestion made to them in the Straits was to cut out lines through the jungle about 40 yards apart, and, making a heap of rubbish and top soil at convenient distances, to place a plant of *ficus elastica* on top. In six months' time the jungle growth round the plants would require cutting back, and a few supplies would have to be put in. This would have to be repeated two or three times at intervals of six months or so till the plants were well established, and in a few years the trees would kill out the remaining jungle! *Ficus elastica* is not the most valuable of rubber trees; but, if this description of its hardihood be not exaggerated—and we fancy it is—there would appear to be a grand future before it.

OUTLOOK IN THE TEA MARKET.

GENERAL REVIEW OF THE DECLINE OF CHINA TEA AND THE ADVANCE OF INDIAN AND CEYLON.

A London authority on tea, writes:—"I enclose an article from the *Financial News* of the 22nd inst. on 'The Outlook in the Tea Market' which will doubtless interest you":—

Beyond a general idea that the teas of India and Ceylon have for some years past been gradually displacing China teas in the home market, the British public does not appear to have much knowledge of the facts connected with the wonderful development of the tea-planting industry in our Eastern dependencies, or of the size and importance to which that industry has attained. People have been satisfied that when the "resources of civilisation" were

brought to bear in the carrying on of an industry that had hitherto been entirely in the hands of a semi-barbarous population, which obstinately adhered to the most antiquated methods of cultivation and production, the usual results had ensued. Modern skill and science, as applied by British capital and enterprise to the cultivation of the tea plant in India and Ceylon, produced a better article at a lower cost than the old fashioned methods of the Chinese produced, and the weaker industry went to the wall.

At the present time China teas are practically driven out of the English market. When it is considered in how short a time, comparatively, this has been accomplished, this achievement can only be described as remarkable. It is within the experience of only middle-aged persons of the present generation that China teas were absolutely the only teas that could be bought in the English market. Indeed, it was only so recently as 1862 or 1863 that there was any effective competition on the part of Indian tea-growers with China, and for ten or twelve years after that date the consumption of China teas in this country still continued to increase. It was not until Ceylon joined its forces with India as a tea-producer that an effective inroad began to be made upon the Chinese monopoly. From that time, however, the process of displacing China tea in the English market has been very rapid, as will be seen from the following table, which we have taken from returns published by one of the leading authorities on this subject, Messrs. Gow Wilson and Stanton:—

Quantity of Tea on which duty was paid at all bonded Warehouses in the Kingdom during the years named:—

	Indian.	p.c.	Ceylon.	p.c.	China.	p.c.	Total.
	lb.		lb.		&c. lb.		
1883	58,000,000	33	1,000,000	1	111,750,000	66	176,750,000
1886	63,420,000	38	6,245,000	3	104,226,000	59	178,891,000
1889	96,000,000	52	28,500,000	15	61,100,000	33	185,600,000
1892	109,528,000	53	63,102,000	30	34,483,000	17	207,113,000
1895	116,343,000	53	74,024,000	33	31,333,000	14	221,800,000
1897	124,534,000	54	85,493,000	37	21,372,000	9	231,400,000

Even these figures, however, do not give a complete idea of the effectiveness of the rivalry of British-grown teas, or of the real increase of tea consumption in these islands. For several years after the introduction of the teas of India and Ceylon into the English market it was noticed that, although tea-drinking was on the increase, the actual amount of tea imported advanced by very slow degrees. This was clearly shown by the Customs House returns, which showed that the tea duty was almost stationary for four or five years. This led to an inquiry by some of the high officials at the Customs House, with the result that a report was presented which contained the following remark:—"From the information which has been afforded us on the subject, we believe that we make a moderate estimate in assuming that Indian tea goes half as far as Chinese tea, so far as depth of colour and fulness (not delicacy) of flavour are concerned. Thus, if 1 lb. of Chinese tea produce 5 gallons of tea of a certain depth of colour and fulness of flavour, 1 lb. of Indian tea will produce 7½ gallons of a similar beverage." It is clear from this statement—the accuracy of which can be confirmed by any tea-drinker who has taken the trouble to observe and compare—that the present consumption of some 210,000,000 lb. per annum represents a far greater actual increase in the tea-drinking of the country than the figures themselves would seem to show.

There is no doubt, at any rate, about the completeness of the triumph of British-grown over Chinese teas in the home market, and this is, of course, a matter of satisfaction and congratulation. But, on the other hand, the fact that the supply of India and Ceylon teas has been found sufficient to meet the whole of the British demand has given rise to grave doubts as to whether the danger of over-production would not have to be met in the near future. For two or three years past, indeed, this question of over-production has been discussed by those chiefly interested in the industry, and suggestions have been made as to the necessity of measures for curtailing the output. No practical scheme to accomplish that object, however,

has ever been devised, and in the meantime the difficulty has been met by a determined effort to open up new markets for the sale of British-grown tea. Until quite recent years Indian tea has met with scant favour in other countries, and China has almost completely maintained her monopoly in the continental markets, and even in the United States, Canada and Australia. At the time of the Chicago Exhibition, however, efforts were made by the Indian and Ceylon tea-growers to cultivate a taste for their teas in the United States and Canada, and the results of these efforts have been very encouraging, the consumption of British-grown teas in these countries having nearly doubled since 1893. Attention has also been given to Australia as well as to the European markets, and in both these directions there is good promise of success. Australia, especially, is regarded as an excellent field; she has a population second only to Great Britain herself as tea-drinkers, and already 50 per cent. of her tea-import is British-grown. Even Russia, which has obstinately adhered to her preference for the finest Chinese teas, has begun to appreciate the excellence of the Ceylon growths, and is importing more and more each year. The same is the case with France and Germany, and to a less degree with Turkey, Holland, South Africa, and the South American republics. The net result of these attempts to obtain possession of a share in foreign markets has been that the exports of Indian and Ceylon teas to other countries than Great Britain have increased from 19,600,000 lb. in 1893 to 51,148,124 lb. in 1897. With a good prospect that this increase will make further progress in the future, the dread of over-production has to a great extent disappeared, as it is found that there is still considerable scope for expansion of trade in these foreign markets.

It may safely be concluded, then, that the tea-growing industry of our Indian possessions is in a thoroughly sound condition, and has a good prospect of a prosperous future. The trade has, of course, had to meet with bad times and seasons, and during the past twelve or eighteen months has been experiencing one of the worst periods in its history. The recent increase in the price of the rupee has had the effect of stopping in a great measure the opening up of new estates, and this advance in the exchange and the famine and the plague in India have caused an advance in the price of rice—the chief article of food of the coolies—and so have increased the cost of labour to a serious extent. But, in spite of these difficulties, the reports of the established companies as to the results of last season's operations will show that in most cases profits have been fairly well maintained, and that there is no prospect of any serious falling off in dividends.

Considering the amount of capital embarked in this tea cultivation—the total capital of the Indian and Ceylon companies is something like £40,000,000—it is rather strange that so little interest has hitherto been taken in the shares of the various companies by the investing public. For one thing, the tea share market has not lent itself to any great extent to the purposes of the speculator, as the movements in prices are few and gradual. But there has always been a steady though quiet demand for the shares on the part of a small section of the investing public, and as during the last two years greater facilities have been offered for dealings in the shares, there has been a marked increase in the amount of business done on the Stock Exchange. A record of these dealings, with the fluctuations in prices and other information regarding the principal companies, is published in our columns daily. An examination of this table shows that there is an average yield on the present prices of the dividend-paying companies of something like 5 per cent, and it would be supposed that such a return would offer an inducement to more general investment in tea-growing companies. Many of the companies possess considerable reserves, which have been accumulated for the purposes of equalising dividends, and in addition they have in their holdings of actual landed property, buildings, machinery and tea-plants such a

security as should certainly prove attractive to the investor. Tea shares are at present mostly held by people who have resided in India or Ceylon, and their friends—a class who have had an opportunity of seeing on the spot the stability of the industry into which they are putting their money. Still there has of late been a good deal more activity in the dealings in these shares, and there is every prospect that this activity will continue, as, owing to the adverse influences which have affected the tea-growing industry during the last year or two, the prices have declined to a level that is sure to attract the best class of investors. It is, however, a market in which it is desirable that investors should get good expert advice; for tea gardens, like vineyards, are good and bad, and can only be judged by experts.

TEA PLANTING AND FINE PLUCKING.

Mr. Hastings Clarke is an experienced coffee, as well as tea planter—having begun his career in Kadu, Gannawa so far back as June 1860—and let us mention as a common circumstance in those days of old, that for weeks together in crop season, the planter had to keep in the field pretty well all day, having his midday meal sent out to him. Mr. Clarke has passed through harder times with coffee, than any as yet experienced with tea, leaving the fungus out of view. In other words, Mr. Clarke is not at all disappointed with tea on his present visit, even with all the adverse circumstances of the times. It must be confessed, however, that there are few old districts in Ceylon, in which tea does so well as in Kellebokka, its subsoil is particularly good, and this is shown by the way in which the tea goes on flushing even during the present unprecedented drought. For, during his two months' visit, Mr. Clarke has only seen two slight showers of rain in what is a generally wet district. Mr. Clarke is strong on "fine plucking"; his own system is the moderate one adopted by the late Mr. Taylor of Loole Condura and if it were generally followed and estates usually giving up to 600 and even 700 lb. per acre, reduced their income to 500 lb., he thinks 20,000,000 lb. less of an export than estimated, might be realized or say 15 million lb. less, if allowance is made for young tea. But to get the full benefit of fine plucking, there must be close inspection of the work in the field and a constant check maintained.

It is well that thoroughly practical experienced planters, like Mr. Clarke, should continue their connection with Ceylon; and should visit the island periodically. We trust to see Mr. Clarke back again, well and hearty, after a due interval.

LIBERIAN COFFEE IN SUMATRA.—"Old Hand" sends us one of his bright chatty letters, given on another page, with some amusing as well as useful information. What he tells us about Liberian Coffee and its curing and reception at home is very much to the point. No wonder that Sumatra planters should doubt there being so many plantations and planters in little Ceylon. Their huge island covers 162,000 square miles against our 25,000! The total population of Sumatra though, is not larger than that of Ceylon so far as is known. "Old Hand" notices the fact—marvellous indeed—that in the last Report of the Ceylon Planters' Association for the first time in its history, there is absolutely *no mention of coffee!*

FOOD SUPPLY IN CEYLON.

(EXTRACTS FROM ADMINISTRATION REPORT OF THE NUWARA ELIYA DISTRICT FOR 1897.)

There appears to be a general idea that the District of Nuwara Eliya is small, unimportant, and impoverished. Small it is, but the other two epithets certainly do not apply. It contains ore and a variety of gems and minerals; it possesses every variety of climate, except the worst; and there is no product which grows anywhere else in Ceylon which does not grow here. It is abundantly watered, and for the most part remarkably healthy. In Nuwara Eliya itself and its suburbs vegetables and fruits are readily grown and supplied abundantly. European vegetable extending, but the supply is much below the demand (owing to the large quantities daily sent to other towns and outstations), and this shows the advisability of throwing open more lands for vegetable cultivation—*e.g.*, the Barrack Plains.

In the division of Kotmale the people get but one crop a year, but it is plentiful, and even if there were a deficiency they can supplement it with imported rice obtained in exchange for garden produce, cardamoms, &c.

Cardamoms are extensively cultivated, and in native gardens they have taken the place of coffee. In fact, they are becoming a very important industry, exactly suited to native habits, and paying handsomely at present prices. The area of native tea gardens also is rapidly extending, and they show a fair profit owing to the cheapness of the labour employed.

In the Uda Hewaheta district the people get two crops a year, but the fields are not so fertile as those in Kotmale in consequence of the biennial cultivation without the use of manure. During the year under review the people had normal crops from their paddy fields and the most favourable weather. The onion cultivation, which was very extensive in the two Maturata korales, fetched good prices. The greater part of the district is studded with estates, which provide employment to the natives at all times of the year. The cart road from Kandy to Kurunduoya, which passes through the greater part of the district, gives the people the advantage of selling their produce at an enhanced value. The korales of Gannawa, Diyattilaka, and Gangapalata received abundant crops from paddy fields in addition to the garden and chena produce, and they fetched good prices. These three korales require much attention, and with frequent visits by the Revenue Officer there is every prospect of converting them into fields of industry of various kinds, the climate and soil being well adapted for low-country products.

In the Walapane district the rain was seasonable and well distributed, and the crop in consequence has been abundant everywhere except in those isolated villages bordering on the Badulla boundary, which are inaccessible for want of a road and ill-favoured in respect of water supply. There has been a scarcity of food in Arukwatta, which is one of those villages, and I had to make an urgent appeal to Government and obtain a sum of R100 to relieve their immediate distress. To obviate the recurrence of such isolated cases of distress, what this part of the district requires is—

- (1) The opening of roads by a special grant from Government.
- (2) Improvements to and restoration of irrigation works, which cannot fail to develop the country if worked systematically.
- (3) The issue of asweddum licenses to improve irrigable lands where water is available.
- (4) The leasing of lands suitable for coconuts and other useful products on the half-improved value system.
- (5) Improvements to live stock, for which the country is well adapted.
- (6) The establishment of village markets for the encouragement of growers of native products.

The estate and bazaar population lived on imported rice and had sufficient for their needs. They had however a hard time when the goods traffic was obstructed by the slip on the line at Alagalla. The prices of all imported articles suddenly rose to the highest figures ever known in Ceylon—looting and plundering were expected every moment in the bazaars, and, had it actually occurred, the results would have been disastrous. To the prompt and energetic action of the planters, with the co-operation of the police and headmen, is mainly due the preservation of order in these bazaars. I had to send an extra police force to Pundalu-oya, where all the coolies of surrounding estates flocked into the bazaar one day to plunder necessary articles of food when they found they were unable to pay the prices demanded by the boutique-keepers. The panic and threatened damage were however avoided by the wise steps taken by the police under the capable direction of the Unofficial Police Magistrate, Mr. Curtis.

PLANTING NOTES:

HORTICULTURAL COLLEGE, SWANLEY.—The sixth annual report of the Women's Branch is before us. From this it appears that six former students are now engaged in market gardens, eight in public establishments, nine in private gardens, three in institutions, six in teaching. Miss Gulvin, formerly of Kew, has now taken a responsible post, with several gardeners under her. Three other young women are at Kew, and two in the Edinburgh Botanic Garden.—*Gardeners' Chronicle*, March 19.

CAMPHOR: A MINOR PRODUCT.—We direct attention to the letters of Mr. Neck and Mr. Owen on this subject. We have got a tiny bit of Mr. Owen's sample, so there is no mistake about his success; and as the camphor tree, like cinnamon, coppices well, if it will pay to extract from the young shoots and leaves, a very useful minor product the camphor tree may turn out to be. Experiments will have to be tried as to the best months or seasons for making the extract and in the low-country and hill districts, respectively.

CANAIGRE: A MINOR PRODUCT.—A planter writes:—"I send you a cutting from *Household Words* re Canaigre. A small quantity has been produced at Hakgala this year and I believe sent home for report." We quote as follows:—

In the California canaigre, hitherto looked upon as little else than a beautiful weed, agriculturists may find a new field for production and manufacturers an exceptionally useful product. When the Spaniards came to America they found that the Indians of the south-west were skilled in the oldest of all the practical arts—that of leather tanning. The Spanish historians of Mexico mention that the inhabitants of the country used the juice of a native plant in curing skins, and when cattle were introduced that this same plant was found useful in tanning their hides. Recognising the plant as a relative of the European dock, they called it "canaigre," which is a combination of two Spanish words meaning "sour dock." Canaigre possesses the greatest store of tannin of any known plant, and it is this that gives it a value almost inestimable in tanning processes. The culture of canaigre has opened up a great desert agriculture, established a new industry and source of wealth. English tanneries are extensive consumers, and the demand for canaigre chips has grown so rapidly that were every arid acre in south-eastern California and Arizona, the native and favourable habitat for the plant, set with canaigre, there would be no danger of glutting the market.

Mr. Neck will be sure to report *pro bono publico* if the plant is worth cultivating in Ceylon when he gets back a report.

A CURE FOR MANGE IN HORSES.—Boiled linseed oil, sulphur, and kerosene, equal parts: First mix the oil and sulphur, then add the kerosene, and mix well. Applied with a hard stubby brush. Also, a tea-spoonful of carbolic acid to a pint of lard, stirred in and well mixed.—*Queensland Agricultural Journal* for March.

TEA BOXES AND RUBBER IN ASSAM.—The following is an extract from a resolution by the Chief Commissioner, on the Report on Forest Administration in Assam for the year 1896-97.

The larger quantity of timber and forest produce taken by purchasers throughout the province is accounted for entirely by the increase in the quantity of produce taken in the Garo Hills under these *gurkati* passes. The quantity of timber removed by departmental agency was less than half the amount reported in the previous year, a result which cannot be considered satisfactory. The free grants of timber and fuel made during the year under home consumption permits and other concessions are estimated at much the same quantity as in the previous year.

TEA BOXES.		
Outturn, in boxes.		Royalty.
		R.
1893-94	.. 368,323	20,016
1894-95	.. 360,469	19,470
1895-96	.. 384,488	20,917
1896-97	.. 447,563	24,200

The outturn of tea-boxes from saw-mills in the Assam Valley districts which obtain their timber from Government forest shows some improvement. The result is, however, much smaller and the revenue derived by Government from this source is much less than it would have been if more active encouragement had been given by the Department to the saw-mill industry. It is very unsatisfactory that planters should still be compelled in a large measure to draw their supply of tea shocks from Norway and Japan. As members of a *quasi*-Commercial Department, the proper attitude for forest officers to take up in dealing with their customers should be one of conciliation and concession. The larger the development of the saw-mill industry the larger will be the profits of the department. Mr. Cotton has found it a subject of universal complaint throughout the province that the saw-mill industry is languishing, and it appears to him to be the interest as well as the duty of the Forest Department to remove the impression, which undoubtedly prevails, that this state of things is due to the unsympathetic attitude of the departmental authorities. This is another subject which is under special discussion between the Chief Commissioner and the Conservator.

The outturn of home rubber rose from 714 maunds in the previous year to 1,222 maunds, due chiefly to the Darrang *mahals* having been leased out this year, whereas they were closed in 1895-96. The outturn of foreign rubber also increased from 2,520 maunds to 2,825 maunds. The duty collected under both heads increased from Rs2,815 in 1895-96 to Rs6,178 during the year under report. Part of this increase, however, was due to collections which should properly be credited to the previous year. The general results under this head are satisfactory.

The following figures show the financial results of the working of the Forest Department in this province for the last five years (according to the Forest year July to June):

	Receipts.	Expenditure.	Surplus.	Proportion of surplus to receipts.
	R.	R.	R.	
1892-93	420,930	276,948	143,982	34.2
1893-94	492,811	265,421	227,390	46.1
1894-95	444,706	281,652	163,054	36.7
1895-96	404,482	289,323	115,159	28.5
1896-97	440,936	282,191	158,745	36.0

The results for the year, on the whole, compare favourably with those for the previous years.

MESSES. LAARMAN & Co., of Amsterdam, have forwarded a Review of the 1896 Borneo Tobacco crop to Secretary of the B. N. B. Co. Whole crop 1896 in total:—13,992 Bales, British North Borneo Tobacco average about 91c. This is the price it was sold at *first hand*, value about £1,910,000 or—£175,000.—*British North Borneo News*.

RAMIE FIBRE.—Messrs. Lee Hedges & Co. as Agents for Messrs. MacDonald, Boyle & Co. hand us a pamphlet on the Cultivation, Decortication, Treatment, and uses of Ramie Fibre. But it appears to be the same pamphlet we lately noticed and extracted from, the only difference is a correction on page 6, where the second Estimate does not include cost "of erection" of machinery.

How to GROW LARGE MELONS.—A very simple method of watering and at the same time manuring melon vines is to sink a cement or bottled ale-cask a little over half its own depth in the ground. Then throw up the soil against the uncovered part of the cask, thus making it the centre of a gradually sloping mound, much like a scrub turkey's nest. Fill the cask with stable manure. Sow the melon-seeds outside and at a little distance from the cask. Every day or every second day, when the plants have begun to grow vigorously, water the manure in the cask. The liquid passes between the staves, and thus fertilises the plants. A distinct advantage of this process is that during dry weather, when surface watering would only result in baking and caking the soil, the plants draw moisture and nourishment from below, and thus the soil round the roots is kept constantly moist.—*Queensland Agricultural Journal* for March.

HIGH PRICE FOR TEA LAND.—Our contemporary the "Observer" falls into an error in supposing that the price paid—equal to £120 per acre—is the highest price paid for tea estate property in Ceylon. The honour of securing the very highest price per acre does not lie with any Agrapatna estate, but with Dukinfield, which was sold a short while ago for £30,000, or at the rate of £126 per acre. The history of Holbrook and its purchase is given in another column. It may be interesting to compare it with that attaching to Dukinfield, or, as the place was once called, Sylvakande. It was, like so many others of our crack tea estates, once covered with coffee, and was mortgaged to the extent of some £5,000. In course of time the mortgagee foreclosed, and bought the property in—raising another £5,000 on it, which was subsequently increased to £7,000—and proceeded to develop the estate. For a considerable time, it is estimated, the estate brought in a return of 30 per cent. upon the total capital invested in it; and it was ultimately sold, as already stated, for £30,000, which, being at the rate of £126 per acre, is the highest price ever paid for estate property in Ceylon. The estate consisted of 230 acres of tea and 54 acres of forest. The latter was valued at £1,000, and this left the rate for the tea about £126 per acre. We may add that the estate gave a profit of £3,000 in 1896, and, judging by the average obtained for its tea last year, about a similar amount for 1897. Some estates have gone through strange vicissitudes in this respect, and the increase which has taken place in the saleable value of Ceylon tea estates of late years is almost incredible. Six years ago, for instance, we are told, an estate which fetched £5,000 three years afterwards was parted with for £9,000. Only 18 months ago it again changed hands this time realising £16,500. Again, another case is brought to our notice. The sum of £6,800 sufficed to purchase an estate seven years ago when it had no factory, but last year the purchaser refused £30,000 for it! It is interesting to note that a well-known Ceylon planter, now Managing Director of more than one Sterling Tea Company in London, refused to give more than £6,500 for this estate, so that he lost over £20,000 by not springing another £300—a reflection which we feel sure must be a most unpleasant memory to him to this day!—*Local "Times."*

TROUT OVA.—The letter, which Mr. Burrows, Hon. Secretary to the Ceylon Fishing Club, sends us (see further on) will be read with great satisfaction, not only by all anglers, but by all who wish well to the most interesting, and even important experiment of introducing trout into Ceylon streams. The capture of so fine a fish, the other day by Mr. Maselfield, shows the potentialities involved, and we do not see why most of the Dimbula, Dikoya, Maskeliya, Ramboda and Upper Uva streams should not be supplied with fry, by-and-bye. Never was there a scheme better worth persevering with.

NARROW WAGGON TIRES have been proved inferior to broad tires by the Missouri Agricultural authorities. Given the same amount of draught, or pull, a load of 2,518 lb. can be hauled over macadam on 6in. tires, and only 2,000 on 1½in. tires. Tests have been made on all kinds of roads for a year, and the only surfaces unfavourable to broad tires have been found to be dry roads with several inches of dust, and sticky clay roads with firm ground underneath. On clay roads deep with mud, but drying on top, the tests were favourable to the broad tire. Six inches, the authorities have decided, is the best width of tire for a combined farm and road waggon.—*Home paper*, March 17.

COFFEE IN SOUTH AMERICA.—According to the *Bulletin* of the Bureau of the American Republics for January, coffee is still in the experimental stage of cultivation in Paraguay, but numerous plantations are now being made in different parts of the country, and especially in the government settlements. The largest plantation is to be found in the department of Emboscada. There are in this plantation already some 200,000 trees bearing fruit which is declared by some to be superior to the Brazilian berry. The results so far are considered satisfactory and encouraging, but whether the venture will ultimately prove a profitable one it is not at present possible to say. The government assists the coffee planters by granting them facilities for acquiring seed and by offering a reward of 30 cents for every plant transplanted and in good condition at the time of application. A loan of 30 cents for each plant may also be obtained, and, if granted, is payable in two yearly installments of 15 cents per plant.—*Rio News*, Feb. 22.

IMPERIAL TEA DUTY.—We had personally compiled a more elaborate return than the following, for our Handbook, a few weeks ago. Still the figures here given are strikingly put by the *London Times*:—

From 1836 to 1852 the tea duty was 2s 1d per lb.; in 1856 it was 1s 9d; in 1860 1s 5d; in 1863 1s; from 1865 to 1889 6d; and since 1890 4d. The yield of the duty is now about what it was 60 years ago, when the burden was more than 6 times what it is now. The yield of each penny of duty, which was £183,000 in 1835, was £263,000 in 1856, £426,000 in 1866, £320,000 in 1876, £745,000 in 1885 and in 1896 it had risen to £949,000. At the same time the whole sale price of tea apart from the duty had been steadily falling. Thirty years ago it was on the average 1s 7d per lb.; it is now only 9½d. Nor is it unimportant to note that while, just after the close of the Crimean War, we drew almost the whole of the tea consumed, in Great Britain from China, about 80 per cent of the supply comes in the present day from India and Ceylon.

The price of tea averages 9 d, says *The Times*. We wish it did in Mincing Lane.

SCIENCE AND MANURING.

Certainly, one of the most valuable contributions to the discussion of this subject that we have read for a long time is that printed elsewhere above Mr. A. Baur's name. It is a letter that ought to be carefully considered by every Proprietary Planter and responsible Estate Manager in the island. Not simply is it well to understand the action of fertilisers aright; but immensely more important is it to make sure that in spending money on certain costly ingredients, we are not doing the wrong thing—wasting our money in fact, or so using it that the return for our investment cannot be reaped for many years to come. Mr. Baur shows how all this may happen, and so plainly that he who runs may read to understand. But we may be allowed to supplement what he writes with the words of one of the most illustrious Agricultural Chemists of the day, who writes:—"In 25 or 30 years, Europe has exhausted the supply of Peruvian guano. It is now doing its best to use up the available supply of nitrate of soda which is being brought over from the coast of Chili. By the replacement of gas by electricity another powerful agent of fertility—sulphate of ammonia—will soon disappear. What then shall become of us with the ever-increasing desire of increasing the fertility of our soils? The prospect might be alarming, if it were not for the micro-organisms, whose existence we have so long ignored and whose real importance we only begin to understand. As a matter of fact we can look forward now without the least fear to the exhaustion of those artificial sources of nitrogen, which we considered indispensable to ensure good crops. We can proclaim, not as a prophecy, but with certitude: the reign of the nitrogenous manures is finished and that of the bacteria commences."

Still further, we may put the matter after a more practical fashion still. We understand that one of the most approved preparations of artificial manures hitherto applied for tea in Ceylon consists of 7 to 8 per cent. Nitrogen, 2 to 3 per cent Phosphoric Acid, and 4 or 5 per cent of Potash. Now let this be contrasted with what is formally recommended by the well-known Analytical Chemist Mr. John Hughes, and the immense difference cannot fail to be realised:—

3 % Nitrogen; 10 % Phos. Acid; 15 % Potash.

Still, there is nothing like a practical demonstration, and we would therefore recommend a trial of each mixture on an acre or two of the same tea land with as nearly as possible the same conditions.

COFFEE CULTURE IN HAWAII.

Consul-General William Hayward, at Honolulu, has been studying the possibilities of coffee culture in the Hawaiian Islands. He has spent some time inspecting the different coffee plantations to find if coffee could be grown profitably and the amount of capital required for its successful cultivation. The investigations was undertaken as a result of numerous inquiries from this country. The report is, therefore, very largely advisory in character. In part Mr. Hayward says: "There is no doubt in my mind, and I think it has been demonstrated, that coffee will grow in many parts of the islands, and, if properly

cultivated, will bear crops which will compare favorably with those produced in other countries. Still, the industry is so young that it is yet a question what per cent will be realised on the investment. Estimates range from 12 to 75 per cent. In questioning the planters on the subjects which had been decided, I found there was an unanimity of opinion, but no two men could, off hand, give the same estimate and support the opinion by facts. This year's crop will furnish some information as to the value of Hawaiian coffee in the markets of the world. The production, heretofore, has been so small that the price which has been paid is no criterion of what the standard value will be. The prices received have probably been for perfect coffee, the broken berries being reserved for home consumption. I believe, however, that the planters will lose nothing by proper grading. The quality of the coffee raised here is of the best. I was shown a letter from a prominent coffee dealer in New York to whom had been sent several samples of Hawaiian coffee for appraisement. He thought after proper grading the best would bring the New York 22 cents per pound.

"I do not think it advisable for any one to come here with the sole object of raising coffee unless he has at least \$5,000. It would be better if he had \$10,000 to \$15,000, or even \$20,000. With that amount of money, enough has already been accomplished to demonstrate that coffee raising will be profitable. One can eventually become a coffee planter on much less if he will raise other products on which he can quickly realize, only planting coffee as he means will permit.

"I visited a place where I saw as fine a lot of corn as ever grew. It was planted between one-year-old coffee trees. The owner told me that he got two crops a year, for which found a ready sale. The land produce each year \$100 worth of corn per acre. Potatoes would, I am sure, grow well on this land and command a good price. I had a conversation with a gentleman who is now engaged in raising fruit in California. He had just returned from Hawaii, having taken about the same trip I did. He told me he had bought a lot and intended to put it in fruit and coffee, as he felt confident that the fruit would be a success, even if the coffee was a failure.

"There is a class of people in the United States with certain incomes who, for reasons of health, are compelled to leave their homes in winter for a milder climate. Coffee raising to them, I think, would be a good thing. The climate is mild without being enervating. An investment of from \$10,000 to \$15,000 would buy a place already started, which would pay enough to allow of the employment of a competent manager, the expenses of a winter's residence on the place, and more than legal interest on the investment.

"To the man who has decided to embark as a coffee planter I have a few words of advice to offer. Do not under any circumstance commit yourself to the purchase of land until you have thoroughly gone over every foot of it, and do not do it then until you have visited all the coffee districts. While coffee, apparently, will grow in all the districts, you will be surprised to find how much they differ climatically. My advice would be to land at Honolulu and, after ascertaining all you can from the government and private parties as to land which is on the market, take a steamer for the island of Hawaii, buy a horse and employ some reliable person to pilot you around the island, visiting as many places as you can. You will be surprised to find how much you will have learned. You will also see how the planters live and work, and will be better able to decide whether the life will be agreeable to you. I do not believe everyone is fitted to be a coffee planter, and many will foolishly plunge into the business only to realize, in a few months, when too late to recede, that ten hours, work every day in a clearing with, in some instances, your nearest neighbour a mile or two away, with no means of visiting him, save over a miserable trail, is far different from life in a big city."—*Ki'o News*, Feb. 23.

THE NEW AMERICAN TEA LAW.

We read in the latest *American Grocer* that the constitutionality of the new tea law has been attacked by a firm of importers, through a suit brought in the United States Circuit Court, to restrain the Collector of Customs at New York from destroying a lot of rejected tea.

The tea trade, ostensibly, sought to exclude the importation of unwholesome or injurious teas—a very commendatory act; but the new law, with its arbitrary standards, excludes many low-grade teas that are unobjectionable from a sanitary standpoint. The attorneys in the case state that the whole proceeding, in connection with examination is secret and somewhat of a “star chamber” character. The Secretary of the Treasury fixes his standards in February of each year. If teas are on the way during the change of standards, on arrival they will be judged by the new standards, the law making no provision for their being judged by the old standards. The claim was made that Congress was fooled in passing the act, the real purpose of its being passed being to shut out moderate-priced teas so as to make it possible to put on the market large quantities of old and inferior teas which could not compete with good, low-priced teas, and that this has been the actual result of the act. At any rate, the existence of this act makes the importation of teas a business too precarious to be continued. The claim of the plaintiffs is that the act is unconstitutional and void. The tea trade are said to be very timid in resisting the enforcement of the act, because the power of the examiners is so absolutely discretionary that a slight prejudice against a firm on the part of an examiner is liable to unconsciously affect his judgment, although he may be perfectly honest in the premises. No claim is made or suggestion that the examiners have not acted in this case with entire honesty and good faith; but the fact is that the power to almost arbitrarily exclude teas without appeal is too great a power to place in the hands of any official. The appeal to the Board of Appraisers is almost useless, inasmuch as the persons employed to examine teas acquire the habit of being a sort of prosecutors for the Government, and their natural tendency is to affirm one another's reports without any want of good faith on their part. Also the standards fixed are really no test of the quality or wholesomeness of the tea. In point of fact, the teas excluded are of a far higher quality as to purity and fitness for consumption than great quantities of teas which are admitted without objection.

The operation of the act is also capricious and arbitrary. At the port of New York the examiners seem to go on the principle of giving the benefit of the doubt to the Government in excluding the teas. In other ports they adopt the opposite policy.

The ostensible purpose of the act is to compel the American people to drink a higher-priced class of tea than they would otherwise do. The pretext for the exercise of the power by Congress is its constitutional power to regulate commerce; but the real, practical operation of the act is the exercise of police or health power for the tea-drinking in the United States. This power is not vested in Congress, and if the act were expressed to be for that police purpose its unconstitutionality would be beyond question; but the power to regulate commerce is not lost to Congress, because its results may be in some respects the exercise of police power.

There is a great deal of truth in the above criticism says the *American Grocer*. We cannot believe that Congress designed to exclude any tea not injurious to health, simply because it is low in price. The standards adopted by the Government do not recognize the amount of *theine* in tea; the amount of extractive matter; amount of ash, or other considerations which determine the physiological value of tea. The standards are purely commercial, and it is a well-known fact that many high-priced teas are inferior, from a chemical standpoint, to many low-grade teas. The absurd sieve test imposed last year revealed the unfairness of the standards governing last season's import, as it excluded some of the choicest teas grown in the world. We believe that the trade (including the critics) are a unit in favour of excluding tea that is injurious to health, but they are not a unit in favour of excluding very cheap tea if it is wholesome.

We can say positively that some firms here have been overloaded for years with unsaleable low-grade teas. If the Government stops the importation of a tea below the standard, is it not equally its duty to stop the sale of similar tea now on the market?

Another feature of the situation is revealed in a letter from China, printed in the *New York Journal of Commerce* of Feb. 21, in which is a statement showing conclusively that the new tea act was justifiable, in so far as it prohibits imports of unwholesome or adulterated tea, and that it has had the effect of compelling Chinese dealers to improve the leaf. Reference is then made to facts to demonstrate the beneficial effect of a National tea act; but should the act deny entry to a tea that is wholesome, simply because it is of low grade, or, what some designate cheap and nasty? If the same rule was applied to the importation of coffee, *triage*, or very low grades, would be excluded. And yet it has never been charged that such coffee is prejudicial to health.

Thus far the tea act has enabled holders to unload low-grade teas imported prior to the act at a big advance, their conscience not standing in the way of their selling teas for consumption that are below the established standards; while their conscience is very tender when similar teas are now offered for entry under the act.

We very much doubt, says our contemporary, if the Government has a right to establish any other standard than that of wholesomeness in admitting tea or any other article of food to entry for consumption. We are glad that this question is to come up for review by the courts.

EAST INDIAN PLANTING.

A writer in *Calcutta paper, Capital*, thinks that a farm for the purpose of producing lac affords as good an investment for capital as any the country can offer. It is said to have failed when attempted in Cachar, but that was simply from the person who undertook the business being unacquainted with the habits of the insect, and placing his nucleus out in the full blaze of the sun, whereas it is only found in the densest forest undergrowth. Again, he says, take the item of beeswax. The southern face of the mid-mountain range teems with hives; and in many villages artificial ones may be seen. Yet no European has turned his attention to the important industry of apiculture, though no more eligible site than the orange groves could be had, the blossoms of that fruit in March and April affording, perhaps, the most suitable food for the many million of insects that are encountered. Although there is but little doing in the wholesale trade, the price of the comb, as

brought in by the people, has risen within the last decade from two to six annas per seer, and, allowing 25 per cent. for honey and impurities, there results a difference between the £20 for the 70 seers that will make up the cwt. and £7 to £8, the latest quotation in London for Zanzibar wax which the Assam article resembles. Unfortunately, the country is so sparsely inhabited that even were a monopoly secured, the quantity brought in would hardly justify the establishment of a go-down; so if wax is to be produced on a large scale, systematic apiculture must be resorted to, and the above figures sufficiently indicate the profits of such an undertaking. The only expense would be the cost of hives, dwelling-house, and fencing-in; the place would need snading and have to be in the neighbourhood of clean water, for the bee is a thirsty insect and affects seclusion. The writer might suggest also that European cultivators could do a great deal in ensuring our getting a purer wax from India than we obtain at present. Referring to castor oil he suggests that the other oil plants might be cultivated for the sake of the manure afforded by the oilcake. He also alludes to the possibilities in growing ginger, turmeric and anise, which could be raised in any quantity.—*British and Colonial Druggist*, March 18.

NYASSA RUBBER—A NEW AFRICAN SORT.

Among the lots of rubber offered at the Antwerp inscription sales in February was one of 3,360 pounds described thus: "Nyassa—generally small and medium-size ball, hard good quality, Upper Congo red ball quality." The brokers' estimation was 7.35 francs per kilogram, while prime Lagos s'lk strips were put down at 7 francs. Nyassa rubber comes from the new protectorate of British Central Africa, and in regard to it we quote from the *British Central Africa Gazette*, published at Zomba, in the issue for November 8th, 1897:

"Considerable quantities of rubber are now being collected on Lake Nyassa, and it appears not improbable that this may become an article of extensive export from the protectorate. Rubber is being sent down from Bandawe at the rate of about two tons per month at present. It is collected from the *Landolphia* vine. This creeper does not grow all over the country, but it is found solely along the banks of streams. In the country west of Nkata and Bandawe all the numerous stream valleys contain *Landolphia*."

This rubber is shipped by the steamers of the African Lakes Corporation, Limited, across Lake Nyassa, down the river Shire to the Zambesi, and thence to the mouth of the latter, on the East African coast. The amount of such shipments, during the year ended March 31st, 1897, was 5,667 pounds, valued at the point of export at £277. The value of the rubber shipped during the preceding year was £28. —*India Rubber World*, March 10.

BRAZIL AND ITS RESOURCES.

"It is remarkable how little the average American businessman knows, not of Brazil only, but of the entire continent to the south of him," says Hon. Thomas L. Thompson in the *March Forum*. "He does not realize that the link is nearly formed by which he may ride across the continent, from Valparaiso to Buenos Ayres, in a railway coach with accommodations equal to those of the best Pullman car. * * * While seeking in the Far East for consumers of his surplus products of farm and factory, the average American overlooks the opportunities open to his enterprise and sagacity in a continent which lies, comparatively speaking, at the threshold of his factory and the gateway of his farm. At the same time, he fails utterly to realize that the United States—the chief consumer of South American pro-

ducts—is paying, by way of exchange, a vast tribute to Europe, not merely on what is taken from her nearest and most natural market for her own products, but on all she sells there. If intelligently utilized, not only would the semihome markets of South America save to the American consumer what he now pays in exchange to his more enterprising European competitor, who has forestalled him in the exploration and development of the vast resources of the southern republics, but they would in time turn the overwhelmingly adverse balance of trade to the credit of the United States. * * * Today the leading commercial city of Brazil, Rio de Janeiro, with a population of nearly 750,000 souls, contains but one strictly American mercantile house supported by any considerable amount of capital. In the entire republic, with a population of 16,000,000, only two such houses exist. The American colony, registered, numbers probably 1,500, embracing a few coffee buyers (agents only), farmers, clerks, mechanics, dentists and other professional men scattered over the country, while the British, French, German, Portuguese and Spanish colonies number respectively, in the order named, many thousand inhabitants, representing hundreds of millions of dollars placed in mercantile, banking, mining, transportation and other pursuits which yield remunerative dividends. * * * I believe that Brazil offers many good openings to energy and enterprise if properly grided by administrative capacity and duly supported by capital. It is obvious, in particular, that a large number of energetic and intelligent Americans engaged in industrial pursuits in Brazil would have an enormous influence in developing the natural resources, and, consequently, in increasing the purchasing power, of the country, as well as in directing trade toward the United States."—*Bradstr. ets.*

TO COMPUTE THE WEIGHT OF LIVE STOCK.

Ascertain the girth, in inches, back of the shoulders square and the length, in inches, from the buttock to a point even with the point of the shoulder blade.

2.—Multiply the girth by the length and divide the product by 144 to arrive at the superficial feet; then multiply the superficial feet by the number of lbs. per foot for cattle of different girths, the product of which will be the number of lb. of beef, veal or pork in the four quarters of the animal.

3.—For cattle of a girth of from five to seven feet take 23 lb. to each superficial foot and for a girth of from seven to nine feet 31 lb. to the superficial foot.

4.—For small cattle and calves of a girth of from three to five feet, 16 lb. to the foot, and for sheep, pigs and all cattle measuring less than three feet, 11 lb. to the superficial foot.

5.—When the animal is but half fattened a deduction of fourteen in every 280 lb. or one stone in every twenty should be made, but if very fat, one stone for every twenty should be added.

6.—Suppose it is desired to ascertain the weight of an animal, whose girth is six feet four inches and length five feet three inches.

7.—76 inches girth by 63 inches length equal 4788 ÷ 144 = 33.25 superficial feet. Multiply this result by 23 lb. and you will have 764.75 lb. 51.1.7 or stone.

8.—The deduction or additions mentioned in paragraph five should then be made, according as to whether the animal may be in ordinary or in every fat condition.—B. C. OGDEN, in the *Journal of the Jamaica Agricultural Society* for Feb.

MARKET FOR MINOR PRODUCTS.

London, March 17.

ZANZIBAR VANILLAS.—Vanilla was introduced into Zanzibar by Jack Savey, an old sailor, who planted the vines at his house more for decorative purposes than anything else; but the plants have done so well that Savey has had more than one crop of good vanillas off them. His place is in the Mweru Valley. A local journal, referring to the matter, says "plantations may be put down with the reasonable certainty that they will in due course come to flower and fruit. If the industry were seriously taken up, there is no reason why Zanzibar should not in time become a large exporting-country, and run in harness with Reunion and Seychelles."

CINCHONA.

CLASSIFICATION.—Before the commencement of the sales on Tuesday Mr. David Howard, speaking as a manufacturer, drew the attention of the buyers to what he considered a defect in the classification of barks as regards the term "slightly country-damaged." As matters stood now the question of damage was a confusing one, he said. It ought to be clearly understood and adhered to that a slight discolouration of manufacturing bark, such as principally arose through defective collection, should not be classed as "country-damaged" unless the bark was musty or damp. "Sea-damaged" should remain as at present. Also slightly musty bark should not be classed as "country damaged." Another point was, Would the druggists be prepared to allow any such licence? Mr. Woodhouse suggested that Mr. Howard should submit his proposals in the form of a motion at the next sales, and this he agreed to do. Mr. Howard also complained that the August bark-sales in London followed very closely on the Amsterdam sales, and it was a great strain to analyse two lots of samples in so short a time. The whole matter will come up a month hence.

LOWER PRICES.—The auctions were then proceeded with, the tone being better than a month ago, and buying fairly good, especially for the American market and druggists. Altogether there were eleven catalogues, which included 2,826 packages of bark, divided as follows:—

	Packages offered	Packages sold
East Indian cinchona ..	2,355	1,641
Java cinchona ..	240	43
Ceylon cinchona ..	105	105
South American cinchona ..	89	26
African cinchona ..	57	5
	2,826	1,820

The bulk of the offerings sold at a decline of $\frac{1}{2}$ to $\frac{1}{4}$ per lb. the unit being generally $\frac{1}{2}$ to 1d—a sensible decline. The principal buyers in order of the quantities of bark purchased by them were as follows:—

	Lbs.
Agents for the American and Italian factories ..	121,653
Agents for the Brunswick factory ..	72,592
Messrs. Howards & Sons ..	43,010
Agents for the Frankfort and Stuttgart works ..	30,085
Agents for the Imperial Quinine factory ..	24,750
Agents for the Auerbach factory ..	23,128
Agents for the Mannheim and Amsterdam factories ..	16,921
Druggists, &c ..	108,450
Total quantity sold ..	440,619
Bought in or withdrawn ..	213,534
Total quantity of bark offered ..	654,153

The following prices were realised:—Java, ledger stem chips, $4\frac{1}{2}$ to $4\frac{3}{4}$ per lb.; South American, Bolivian cultivated Calisaya quill, 5d to $5\frac{1}{2}$ d; 25 bales artagena, 4 bales Pitayo, and 29 Maracaibo were

bought in. Five bales of African chips, $3\frac{3}{4}$ d; Ceylon Succirubra, natural stem chips, $2\frac{3}{4}$ d; fair to good renewed shaving, $4\frac{1}{4}$ d; hybrid root, $3\frac{3}{4}$ d to $4\frac{1}{4}$ d; East Indian, natural red chips and shavings, 2d to $2\frac{1}{4}$ d; fair to good $2\frac{3}{4}$ d; fine, $2\frac{3}{4}$ d to $2\frac{1}{2}$ d; ordinary renewed, $1\frac{1}{2}$ to $2\frac{1}{4}$ d; fair to good, $2\frac{3}{4}$ d to $2\frac{1}{2}$ d; druggists medium quill, $3\frac{1}{4}$ d to $4\frac{1}{2}$ d; fine bold silvery, $7\frac{1}{4}$ d; small crown chips, $1\frac{1}{4}$ d to $1\frac{1}{2}$ d; medium to fair, $2\frac{3}{4}$ d to $2\frac{1}{2}$ d; good, $2\frac{3}{4}$ d; to $3\frac{3}{4}$ d; good rich renewed, 4d to $5\frac{1}{2}$ d; ordinary, 3d to $3\frac{3}{4}$ d; small ledger chips, $1\frac{1}{2}$ d to 2d; medium to fair, $2\frac{3}{4}$ d to $3\frac{3}{4}$ d; and renewed, $2\frac{1}{4}$ d to $3\frac{3}{4}$ d per lb. The offerings in the drug-auctions today are reported under that section. The arrivals this week include 1,724 packages from Calicut and 342 from Beypore.

JAVA CINCHONA.—The Dutch Indian Government report on the Java cinchona-plantations for 1897 has just been issued. A good part of the report is devoted to consideration of the influence of mowing and different methods of culture upon the quinine value of the bark. During 1897 152,000 seedlings were planted—viz., 35,000 Ledgerianas, 77,000 Succirubras, and 40,000 hybrids of these two species. The total number of trees in the plantations at present is 2,749,570, consisting of 1,718,495 Ledgerianas, 496,534 Succirubras, 476,816 hybrids of these two species, and 57,695 officialis. We have also to note that the Dutch Indian Government has issued a decree, stating as a preliminary measure for the conversion of the Government cinchona-plantations in the Preanger residence of Java to a mere experimental station it has been decided gradually to uproot those parts of the plantations which it is the intention to abandon. The post of assistant-director of the Government cinchona-plantations is abolished, and until the reforms for restricting the Government undertaking to an experimental station are complete, there will be appointed an official botanist at a salary equal to 500*l.*, 580*l.*, and 670*l.* per year respectively, with free house.

BRAZIL CINCHONA.—Should South America ever regain the position she once held in the supply of cinchona to Europe depends upon whether she will be able to grow the richest bark, and secure cheap transit and labour. In this connection we notice some progress in the first requirement, the cinchona-plantations in Brazil having put into the ground close upon half a million Ledgeriana seedlings, and 20,000 seedlings of hybrid cinchona. The plantations are under Government supervision, and the immediate intention of them is to provide an adequate supply of quinine-yielding bark for home use. It is not inconceivable that in course of time sufficient bark may be produced to permit of exportation.

CASTOR-SEED.—Small sound seed sold at 4s per cwt.

CROTON-SEED.—Good bright sold at 5s per cwt.

VANILLA.—Nearly 500 tins offered, of which about three-fourths sold; good to fine crystallised chocolate, 8 inches to $8\frac{1}{2}$ inches, 2s 6d to 2s.; $7\frac{1}{2}$ inches to 8 inches, 2s.; $6\frac{1}{2}$ inches to $7\frac{1}{2}$ inches, 1s 6d; to 20s 6d 4 inches to $6\frac{1}{2}$ inches, 1s; to 18s; good fresh, $4\frac{1}{2}$ inches to 6 inches, 16s; medium brownish 12s 16d, to 16s and dry foxy at 10s to 10s. 6d.—*Chemist and Druggist*, March 91.

EXPERIMENTS WITH RAMIE.

KURUNEGALA ESTATES COMPANY.

The directors of the Kurunegala Estate Company laid their annual report before the shareholders on the 29th ultimo. The Company is a private one, but a few particulars are available. The estate is all young, and the tea planted is very promising. In tea there are $17\frac{1}{2}$ acres, rising three years, and 102 acres rising two years, and 120 rising one year. Of Liberian coffee there are 140 acres rising 3 years, and of cacao there are 118 acres from 3 to 5 years old, and most of the land is interplanted with coconuts. This year it is intended to plant up the Liberian coffee in tea and also about 40 acres of new land. The total acreage is 1,119 acres. There are about 10 acres of rhea fibre, and the Company has imported a decorticating machine, and is going to make some experi-

ments; and, if the yield is satisfactory, it is intended to expand the acreage in that product at once.

The directors for the new year are—J. Manley Power, Managing Director; E. Scott, F. H. Shelley and H. Reynolds.

REPORT.

The directors have pleasure in submitting their report on the affairs of the Company for the year ending 31st December 1897.

The following is the detailed acreage of their property:—

	Acres.
Tea and Coconuts over one year old ..	110
Tea over one year ..	72
Tea and Coconuts over 2 years old ..	17 $\frac{1}{2}$
Tea and Rhea one year old ..	15
Cacao in bearing ..	52
Cacao not in bearing with Coconuts ..	79
Cacao, Coffee and Coconuts in bearing ..	13
Coconuts four years old ..	11
Liberian Coffee and Coconuts, two years..	140
	509 $\frac{1}{2}$
Jungle and Chena ..	679 $\frac{1}{2}$
	1,189

All the products, with the exception of the Liberian coffee, are coming on well, and the Directors propose to plant up the whole of the Liberian coffee in tea during 1898, and also 50 acres of the cacao "not in bearing." The whole of the tea was supplied in 1897, and the young plants are coming on satisfactorily.—Local "Times."

SALE OF PARA RUBBER SEED.

Acting under the instructions of Mr. John C. Willis, Director of the Royal Botanical Gardens of Ceylon, Mr. C. E. H. Symons, put up for sale at the Chamber of Commerce recently 70,000 para rubber seeds in seven lots of 10,000 each. The sale was poorly attended, there being only seven gentlemen present, besides Mr. Symons, but the bidding was satisfactory if not brisk. Mr. Symons opened the sale by reading the conditions under which the seeds were to be purchased, stating these to be that purchasers would be required to enter into a written agreement to the effect that the seed shall be cultivated in Ceylon in suitable districts and that it shall not be re-sold. Some desultory informal discussion followed as to the interpretation of the phrase "suitable locality," Mr. Symons explaining the matter by quoting from a letter. The first lot of 10,000 seeds was put up for sale at the upset price of R15, and the first bid was a rupee higher. The price briskly rose to R29, at which figure the hammer fell to the bid of Mr. M. Bremer on behalf of Messrs. Geo. Steuart & Co. The second and succeeding lots of 10,000 each were put up at the upset price of R25. R27 closed the competition for the second lot for Messrs. Lee, Hedges & Co. Mr. R. J. Booth captured the third lot (for Messrs. Cumberbatch & Co.) at R26. The same figure won the fourth lot for Mr. R. F. S. Hardie on the bidding of Mr. Tulloch. The fifth lot fell at the upset price R25, to Messrs. Finlay, Mair & Co. The same firm secured sixth lot for a rupee higher (R26) and with another rupee more (at R27) purchased the last lot as well.

BOLIVIA has an area of 499,200,000 acres, and a population of 2,500,000, or an average of nearly 230 acres to each inhabitant. This land is extremely rich in valuable woods, silver, copper, tin, etc., and the soil is especially adapted to the cultivation of coffee and tobacco.—*American Grocer.*

SALE OF A VALUABLE DIMBULA TEA PROPERTY:

OVER £102 AN ACRE PAID FOR HOLBROOK.

We learn that the price paid by the Messrs. Wyse to Mr. Thos. Mackie, the seller of Holbrook, in the Agra-patena division of Dimbula, is £20,000. The estate consists of 188 acres, of which 160 are in tea of all ages, with 28 acres of grass, patna and some timber; while trees are freely planted throughout the cultivated lands. There is no Factory—the tea being made at Agra Ouvah—but there is a valuable Cattle Establishment for Dairy, and Manuring purposes; and also roadside kaddies paying rent, where large heaps of manure accumulate from time to time. The price paid shows that confidence in high-grown tea in Ceylon has by no means abated; but as a residential property, Holbrook has a special value, and it is besides a perfect model of a highly-cultivated plantation on fine soil, with a delightful Eastern aspect. The price, we need scarcely say, is equal to more than £120 per acre.

Holbrook was originally opened as a select "home" estate—a place to retire to whatever happened—by Mr. H. S. Saunders. When the bad days in coffee arrived, we believe Mr. Saunders more than once cheered his friends by remarking: "Well, if the worse comes to the worst, there is Holbrook to retire to!" Alas when the big crash did occur, Mr. Saunders like so many more had to say good-bye to Ceylon; and Holbrook was taken over by Sir Alfred Dent's Firm. Exactly four years ago, Mr. Thomas Mackie purchased this model little place and at a price that caused some people to think that Mr. Mackie was rather rash; but with the result that—apart from an income which has averaged £2,200 per annum from the property,—Mr. Mackie has now doubled his capital plus £500! This, of course, is one of the exceptional experiences—almost romances—connected with estate property in Ceylon of which we learn at rare intervals. Let it be clearly understood that Holbrook comprises one of the choicest bits of soil in the country, with a perfect climate for tea and to crown this, that most liberal and judicious cultivation has been followed by Mr. Mackie's direction, admirably carried out by his Superintendent Mr. Bartlett. Mr. Mackie has himself been a noted cultivator since the old Pitikande (Matale) days—his successor there Mr. Joseph Fraser, well maintaining the tradition. Purchasing Holbrook for over £10,000, Mr. Mackie of course at once formed a large Cattle Establishment, having special advantages in grass and patena. Moreover the estate had a long row of way-side "kaddies" for which rent was paid, and through which a further supply of manure was obtainable. Not only for manure too, were the cattle valuable: Holbrook Dairy supplied the district and hospital, with fine milk and butter, and this made no slight adjunct to profits. Briefly, Dairy and Kaddies yielded an average of £550 clear profit per annum, reducing the crop return average to £1,700; but let it be understood that this latter came almost entirely from 93 acres of tea which averaged 867 lb. per acre in crops, one field giving considerably over 1,000 lb. per acre while the price realised has always been much above the island's average. Of course, liberal cultivation told; but the soil and climate were so good that the little place only required pruning once in three years. It will be seen therefore that the Messrs. Wyse buy on a ten per cent basis as regards the experience of the past four years; but it may be asked

where is the security against adverse exchange and a fall in prices from over-production? Well, there is this great advantage, that the new proprietors have 62 acres of young tea, very fine jāt, coming into crop, and that the interference of "coffee" in certain fields will be quite a thing of the past—so that even at £20,000 or £120 per acre—the very highest price, we believe, ever paid for tea land in Ceylon?—there is no reason to doubt that the purchasers may do well. The Agrapātna tea is a choice product and will always—if properly prepared—command a good price; while the fine jāt and rich soil guarantee the maintenance of flavour, body, &c. It is interesting to learn how the Messrs. Napoleon Bonaparte Wyse—relatives of the great Napoleon and the late French Emperor—came to invest in Ceylon and buy Holbrook. The proprietor of Choisy estate, Ramboda, is a merchant, Mr. J. J. Marcel, who was in Ceylon before our day, but who continues to read his *Overland Observer* and T.A., and from whom we hear occasionally. For Mr. Marcel, as Agent and Inspector of Choisy, Mr. Mackie acts. The Messrs. Wyse know Mr. Marcel; they also brought out letters to the highest in the land, and have had ample opportunity of learning all about our higher tea districts. Indeed one of the sons, Mr. N. Bonaparte Wyse, has been assistant on Holbrook under Mr. Bartlett for nearly a year, so that these shrewd as well as accomplished and wealthy French visitors have, by no means, bought "a pig in a poke." We have already mentioned that Mr. Wyse, senior, and Mr. N. L. Wyse have left for Mauritius, where doubtless they have also an interest in estate property.—But now to turn to Mr. Mackie's side, we know, from frequent talks with this gentleman during the past two or three years, how dear the place had become to him and that he has sold, with great reluctance even at £20,000, due to the fact that he had decided to return home on recently joining the firm of Messrs. Taylor & Noble of Leadenhall-street. Holbrook is simply a perfect residential property with delightful surroundings in mountain, forest, patana and river scenery as well as in its "perfect" climate. We may therefore well congratulate the purchaser of the property and home, of which he took possession yesterday, and feel assured that if justice continues to be done, Holbrook will return fair, if not good, interest on his money.—We may add that Messrs. Julius & Creasy were law advisers for Messrs. Wyse and Messrs. J. F. & R. F. de Saram for Mr. Mackie.—And it may be well to say, in conclusion that Mr. Mackie (whom we are glad to learn is in better health than he was some time ago) is by no means withdrawing from his large interests in tea in Ceylon. He is one of the largest shareholders in the Great Western Company and also holds a big interest in the Standard Company; and maintains full faith in the future of Ceylon high-grown tea—provided, we suppose, that the Currency Committee do not raise the rupee still higher!

THE RISKS OF AGRICULTURE.—We suppose the insect referred to in the following cutting from an Indian paper is the same that sucks out the juice here from tender paddy:—"Paddy cultivators in the Hanthawaddy District complain that a large proportion than usual of their paddy has been destroyed by insects. One cultivator in the Twantay subdivision, who expected to get 1,500 baskets, finds he has little over 900. In Mawun the same complaints are heard."

TEA SHIPMENTS FROM CEYLON.

THE QUARTER'S RETURNS.

The following are shipments for the first three months of the year as compared with the three previous seasons—

	TO UNITED KINGDOM.		
	1896. lb.	1897. lb.	1898. lb.
January ..	7,259,549	8,542,897	8,152,769
February ..	7,550,431	6,348,232	6,726,001
March ..	7,130,579	9,172,836	9,500,000
Total..	21,920,559	24,064,015	24,378,770
	TO AUSTRALIAN COLONIES.		
	1896. lb.	1897. lb.	1898. lb.
January ..	775,127	956,977	1,290,955
February ..	934,018	787,916	1,031,972
March ..	1,444,466	1,279,468	1,169,000
Total..	3,153,611	3,024,361	3,482,927

The improved shipments to Australasia are satisfactory.

PATENTS.

The fees prescribed in Schedule IV of the Ordinance No 16 of 1892 have been paid for the continuance of exclusive privilege in respect of the under-mentioned inventions for the periods shown against each:—

No. 419 of 1893.—David Kinloch Michie, Engineer, St. Sebastian Mills, Colombo. Invention for partially disintegrating, equal feeding, breaking, or sizing material, more especially as applied to tea leaf, either while such leaf is in process of manufacture or after it has become dry tea (from July 25, 1897, to July 25, 1899).

No. 424 of 1893.—David Kinloch Michie, Engineer, St. Sebastian Mills, Colombo. Invention for lubricating wireshoot runners (from October 24, 1897, to October 24, 1899).

No. 432 of 1894.—William Jackson, of Thorngrove, Manorfield, Aberdeen, Scotland, Engineer. Improvements in tubular heating stoves, more especially intended for heating air for use in drying tea or other produce (from January 9, 1893, to January 9, 1899).

No. 433 of 1894.—William Jackson, of Thorngrove, Manorfield, Aberdeen, Scotland Engineer. Improvements in apparatus for subjecting materials to the action of hot air or for analogous operations, more especially intended for use in drying tea leaves, coffee, or other produce, for one year (from January 9, 1898, to January 9, 1899).

No. 434 of 1894.—John Roger, of 20, Guildford street, London. Improvement in the manufacture of tea (from January 10, 1893, to January 10 1899).—*Gazette*.

"ALL ABOUT COCONUT PLANTING."

The Brisbane Department of Agriculture have ordered two copies of this book to be added to their reference library.

AGRICULTURAL STUDIES.—What is the Commission, which is said to have been appointed to inquire into the working of the School of Agriculture, about? In India the importance of an agricultural training, and of encouraging a knowledge of agriculture seems fully recognised. We read that "A resolution appears in the *Calcutta Gazette*, sanctioning the opening of agricultural classes at the Seebpore College, Mr. N. G. Mookerjee, now Assistant Director of the Bengal Agricultural Department, has been appointed Agricultural Lecturer. The scheme of education comprises two classes, and the Resolution states that His Honour the Lieutenant-Governor is prepared to assign certain appointments in the Provincial and Subordinate Executive Services to suitable holders of agricultural diplomas."

CARDAMOMS ; COFFEE.

SOUTH MYSORE PLANTERS' ASSOCIATION.

The annual general meeting was held in Belur on 3rd March, and from the Report, we quote:—

The scheme for the employment of an Agricultural Chemist has practically fallen through for want of support. This is the more to be regretted, as from enquiries made it appears that the project would not have involved so large an expenditure as was anticipated, and had only three or four Associations come forward with offers of help, it might have been carried through.

THE CURRENCY QUESTION.—The persistent efforts of the Government of India to bolster up the value of the rupee to nearly double its intrinsic worth is a source of great anxiety to producers. The new gold Note Bill, and the remarks of the Finance Minister, show plainly their determination to keep up the rate of exchange, and indicate the possible introduction later on of a gold standard. With regard to the U.P.A. proposed circular letter, this Association, while it agreed that it was advisable to hold consultation with the Chambers of Commerce, Banks and other Mercantile institutions, deprecated the adoption of a definite policy and recourse to any action until the views of such bodies were ascertained.

Cardamoms.—The crop this season has been better than last, but prices are now lower. I have expressed our thanks to Government for settling the re-assessment question.

Labour has again been plentiful, and is, I think, likely to be so during the coming year; the scale of advances has already been reduced, and I think a combined effort should be made to lower the rate of wages.

Leaf Disease.—Mr. J. L. Stewart spoke as follows: "Gentlemen, I have an explanation to ask for and a few words to say about a very injudicious and pessimistic speech made by one of our delegates, Mr. Harris, at the U.P.A. Meeting last year. This speech has caused an unnecessary small panic among agents, and consequently been the cause of much trouble and annoyance to men who depend on agents for money to work their estates. I use the word unnecessary advisedly, as after nearly twenty years' experience of coffee. I can honestly say that I consider that leaf-disease is no more virulent now than it was when I first came out to this country."

Mr. Harris replied: "Gentlemen, I find it hard to believe in the sincerity of Mr. Stewart's remarks. If he considered that my speech would have such deleterious effects as he has described, why did he not at once denounce it? Instead of waiting six months when the mischief, if any, would be done."

I believe myself that by judicious manuring and careful cultivation we shall successfully contend with the ravages of leaf-disease. We have two things in our favour as compared with Ceylon, a climate subject to long droughts, and a certain isolation as regards the position of our estates. The present season bears out this opinion: leaf-disease has been present in a very mild form, and prospects may be said to be decidedly favourable."

Messrs. J. G. Hamilton and J. A. Harris were re-elected President and Honorary Secretary; Messrs. L. Crawford, G. Horne, J. G. Hamilton, J. A. Harris and W. H. Scott were elected to form the Committee, and Messrs. Graham Anderson, E. M. Playfair and W. H. Scott as extra delegates to the U.P.A.

TO MAKE ROSELLA JAM.—Pick the red calyx from the seed-pods; boil the latter in sufficient water to quite cover them until the jelly is extracted, and they look dry. Strain them, and weigh the liquor and the red fruit. Then boil the fruit in the liquor until it is tender. Add as much weight of sugar as there was of liquor and red fruit before the second boiling, and boil again until it becomes jelly. This is a milder jam than when the seed-pods are not used, but not so good a colour. Boil the red fruit in sufficient water to cover it. When tender weigh it. Add equal weight of fine white sugar, and boil till it sets. — *Queensland Agricultural Journal* for March.

PLANTING NOTES.

THE FINANCIAL AND TEA PROSPECT.—A merchant writes:—"There will be a very strong case against the Government sinking unprofitably millions of rupees. Producers will soon be clamouring (and justly so) for reduced railway rates, if low prices and high exchange continue. What will then become of the anticipated annual surplus revenue?"

OIL ENGINES FOR ESTATES.—Mr. Wm. Forsythe has had a twenty-four brake horse-power Campbell engine at work on Pambegamma estate for about eighteen months past, and is thoroughly satisfied with its working. He tells us that the complaints as to the complicated nature of oil engine and their liability to get out of order do not apply to the Campbell engine, by which he swears as a model of simplicity. During the eighteen months the engine has consumed 3,000 gallons of oil, for which Mr. Forsythe has had to pay R750 duty—at the rate of twenty-five cents a gallon. The rebate of the duty will, he estimates make a reduction in the cost of working of about forty per cent.

THE NORTH MYSORE PLANTERS' ASSOCIATION.—We congratulate a very respected ex-Ceylon planter, Mr. E. C. Bolton, on his election as Chairman of this body, or rather we should congratulate the Association on securing so good and experienced a President. Mr. Bolton's letter to us will be read with interest by old friends in Ceylon; and we now proceed to quote from the Report of his Association and of the proceedings held on 23rd February last:—

ACCOUNTS.—In spite of the fact, that one of the largest Proprietors has withdrawn his estates from the roll of the Association, the income has been sufficient to pay our expenses and leave the Reserve Fund of R1,000 intact. The number of estates now subscribing to the Association is 59. It is with deep regret that we have to record the deaths of Messrs. Brett, W. Allardice, Sen. McMaster and Lee during the year under review.

BAGGANI TODDY TREES.—The objectionable Memorandum No. 215 issued by the Excise Supervisor last October, relating to toddy drawing on Coffee estates, has, on account of the protests raised by the Association been cancelled in the Malnaad, until the end of the current official year.

AGRICULTURAL CHEMIST.—The Mysore Government through the Dewan has expressed its intention of providing an Agricultural Chemist for the Province. The matter is, at present, under the consideration of Dr. Evans, head of the Geological Department, who has kindly undertaken the difficult task of selecting a competent man.

SCALE PESTS.—Although we are not at present afflicted with the green bug, Your committee are pleased to announce that sufficient funds have been collected to send Mr. H. O. Newport of the Lower Palaces to Australia; to bring over a consignment of lady birds, with which it is hoped that the pest may be eventually exterminated.

Mr. Parton and Mr. Leslie proposed, a vote of thanks to Mr. O. Scot Skirving for his services as President during the past year, and regretted the cause which had prevented his attendance at the Meeting. The Committee was then balloted for with the following result:—Mr. E. C. Bolton—President, Members.—Mr. F. J. Parton, Mr. C. H. Browne, Mr. F. Clifford, Mr. W. H. Maynard, Mr. H. M. Northey, Mr. H. Pilkington.

Mr. Bolton returned thanks for the unexpected honour done him and while regretting the absence of abler men to fill the position, assured the meeting that no efforts on his part would be wanting to merit the confidence placed in him.

AGRICULTURAL CHEMIST.—Read letter from Mr. Maxwell Maynard. Resolved:—"That the Honorary Secretary be requested to communicate again with the Mysore Government in the appointment of an Agricultural Chemist for the Province, urging the necessity of early action in the matter."

THE PLANTING RESOURCES OF CUBA.—Although it is three years since the standard of revolt was raised in Cuba against Spanish authority, and the plantations have suffered severely, there is sufficient evidence of the splendid resources of the island. Both the sugar and tobacco crops will be larger than last year. Some people estimate the total yield of sugar for the season as likely to be some 300,000 tons. The yield of tobacco will certainly considerably exceed last year's crop, and it is calculated at some 70,000 to 80,000 bales for the Vuelta Abajo and 120,000 or 130,000 for the rest of the island—in all about 30 per cent of an ordinary crop in times of peace.—*H. and C. Mail*, March 25.

TOBACCO.—There is a great falling-off in the export of leaf tobacco from Bangalore this year, compared with that of previous years, writes a Bangalore paper. Formerly, the octroi duty realised in one week was something like R1,800 and R2,000, but for last week it was only R120. Owing to failure of the crops in the tobacco-growing districts of the Madras Presidency, the merchants in Bangalore have to pay a high price, besides paying duty and income-tax for their goods. The stock taken from the Bonded Warehouse for sale to constituents is less than one-half to what it usually was.

THE FIRST SHIPMENT of the season's fruit was sent away from Port Melbourne on Saturday last. The consignee is an agent who deals extensively with Ceylon, and he has already sent away 150 cases of early apples for sale in that island. The examination of the fruit prior to storing on board ship is placed in the hands of Mr. C. B. Luffmann, and that gentleman finds that the samples so far have been small. As only about 10 per cent. of the cases are opened, however, this must not be taken as proof of inferiority throughout. Yet to judge from the special articles now appearing in "The Leader," it is, unfortunately, most likely that this is the case.—*Melbourne Leader*, Feb. 5.

CARDAMOM HUSKS—What is done with cardamom husks? asks the *Chemist and Druggist* of March 12th, and adds:—"Parcels appear in Mincing Lane occasionally and seldom fail to find a buyer at a penny or so per lb., but much more of them is bought on the Continent, where the husks have a distinct marketable value, and are now sent regularly there from Ceylon. In grading the cardamoms the splits are utilised for this purpose after seeing them. Formerly the husks were thrown away, but for some time back there has been a demand for them. What for?" Just the same use as for cacao or cocoa husks which are sold for 2d to 4d a lb and a delicious drink made therefrom.

COFFEE IN THE STRAITS.—Writes the District Officer, Ulu Selangor, for February, 1898:—"I am sorry to say that, owing to the low price of coffee, many of the Malay planters are allowing their gardens to relapse into jungle, and I have no doubt that we shall find some difficulty in getting in these rents. This is particularly the case in Rawang, where the general depression is causing much distress and the Assistant District Officer has received a petition from the "raiat" asking that Government will forego the collection of their rents. Discretion will, of course, be used in dealing with such cases. The District Officer, Kuala Selangor, for February, 1898, writes:—"The Bantarese coffee on Bukit Panjang is improving. They have cleared off most of their garden crops, and the coffee planted on Bukit Cheraka last year was even better looked after, and has no pisang and tapioca planted amongst it; I have now hopes that they will perhaps do some good here with coffee.

"TEA PLANTING IN FIJI"—is the subject of a letter from a resident planter which contains a good deal of interesting information—as to the suitability of Fiji for the cultivation of our staple. An admirable lay of land and rich soil are great advantages; but if, through "over-production," there is the risk of tea not paying in India and Ceylon later on, how much more liable to be unprofitable in a distant Colony which looks to India for its labour supply?

THE OLIVE OIL TREATMENT OF ENTERIC.—The "Times of India" says:—"It may interest Surgeon-Major Rennie, who is making encouraging experiments at Meerut to establish the curative effect of olive oil in enteric fever, to know that the oil in question is in many parts of Spanish America considered the only remedy of much use in yellow fever. The usual practice is to make at patient drink half-a-pint of olive oil—not always an easy thing to do—and then send for a doctor, who, if he is well advised, repeats the dose. The remedy, real or supposed, is well known to the captains of merchant vessels trading with Havana the Brazils, and Pernambuco. They prescribe it for sailors under their charge who may be attacked by that deadly form of fever.

FINE TEAS AT LAST PUBLIC SALE.—The amount of fine teas offered at public sale was not so large as was the case a few days before, but one or two invoices of excellent tea were nevertheless offered. The following prices were realized for some of the flavory teas:—

Pedro.		Agraouvah.	
	cts.		cts.
47 hf-chs B. O. P.	87	53 hf-chs B. O. P.	66
18 chs P.	72	21 hf-chs O. P.	55
22 chs P. S.	53 bid	7 chs	
21 hf-chs F.	38		
Glasgow.			
42 chs B. O. P.	60 cts.		
14 chs O. P.	67 "		
12 chs P.	47 "		

These teas were again, we understand, mostly bought for shipment to Russia, and, looking to the high rate of exchange, and the terribly bad prices brought out by the last mail from home, the advantages of the Colombo market for sellers are becoming increasingly evident.

THE CAMBRIDGE EXPEDITION TO TORRES STRAITS.—Yesterday (says the *London Times* of March 11th) an expedition of peculiar interest left England. Travelling scholars are often enough sent out both by Oxford and Cambridge; but this is probably the first time that a real exploring expedition has been sent out by either University. The expedition is under the command of Dr. A. Haddon, Professor of Zoology in the Royal College of Science, Dublin, and Lecturer on Anthropology at Cambridge University. The expedition is bound first for Torres Straits, between Australia and New Guinea, and afterwards to the province of Barran, in Central Borneo, in the territory ruled over by the Rajah of Sarawak. The chief object of the expedition will be to investigate the natives, their physical characteristics, their mental condition, their folklore, their customs, their amusements, their songs, their language, and their condition generally, as affected by their geographical environment. A phonograph will form an important part of the equipment of the expedition for the record of language and of native music. By means of a cinematograph, dances and other native ceremonies will be fixed for reproduction at home. The expedition will be away from England for 15 months.

PLANTING IN SUMATRA.

I have just had a visit from a friend returning from a meeting of the Serdang Coffee Planters' Association. "A fine meeting," he said:—

"TWENTY ESTATES REPRESENTED."

And so it was, considering that three years ago there were only four coffee estates representing less than 1,000 acres under cultivation: and today there 24 estates, the smallest of which is over 120 acres, and the largest over 1,500 acres, and extension is the order of the day notwithstanding the slump in the market. I put into my friend's hands the *Ceylon Observer* with account of the Planters' Association meeting in Kandy on 17th Feb. and told him that the Ceylon Planters' Association mustered close on 1,000 strong: "What! all present at the meeting?" "Certainly." I said: for I quite agree with Harry Warrington; that one must lie now and again "for the honor of the old country!" "Oh, but all assistants and so forth go to swell the number." "Nay," I replied: "only estates, firms or companies are represented." "But do you mean to tell me that there are 1,000 estates in Ceylon?"

FERGUSON'S DIRECTORY WAS HANDY

and I was able to show him on page 22, of the Directory of 1896-97—1,529 estates: 1470 managers. "By Jove! fellows here don't know that!" This I was aware of before. You good folks in Ceylon think a deuce of a lot of yourselves. And quite right too. It pleases you and it hurts nobody else. But outsiders have the most fractional idea of the limits of your tight little island.

IDEAS OF CEYLON.

Sometime ago we had a visitor here from Nuwara Eliya, who, during his short stay among us, made himself very popular. A gentleman on his way home said to me "I must go and look up—in Nuwara Eliya; how do I get there?" Upon my giving him directions he threw up his hands and said "Why, I thought you could take a gharry and drive round the whole of Ceylon in two hours!"

From a Singapore paper it appears that the Selangor planters have gone into public mourning over the

FALL IN THE PRICE OF COFFEE

and their own ignorance of curing! This is a pity: and it does not look as if the Selangor men had the grit of their forbears in Ceylon who tackled and struggled through a much more serious crisis than Liberian coffee has yet had to face.

As regards Liberian coffee there are two questions. The curing question has been fully recognised: but few have satisfactorily overcome it. Mark this—well cured Liberian coffee will always fetch its price. One estate that I know fetched a fancy price in Europe two years ago: and has always been able to dispose of its produce at

A FAIR MARKET PRICE.

Another estate shipped a large parcel just before the recent collapse of the market, sold in Europe at public auction it *netted*—when the market was at smash—\$29 per picul. Singapore quotation at same date being \$19—and the shippers were told that they could always get an equal price for such a sample.

So much for Curing.

The other question is prejudice.

All in Ceylon except the podians remember the

PREJUDICE AGAINST CEYLON TEA.

First they said in London that Brokers and Merchants would not waste their time on "Samples." When the samples increased in size, the quality was found fault with. It was trash: it was rank; it was sour; nothing was bad enough for it. And simply because they didn't know what was given them and treated Indian and Ceylon Tea just as they had treated Chinese *chopped straw* for the previous half-century. As a youngster I remember presents of Assam Tea being sent home from India. "Awfully good of dear old Charlie, you know: but ahem, ahem, &c." "Beastly," was whispered: and the tea was relegated to the kitchen.

And so it is with

LIBERIAN COFFEE.

It is called nasty, rank, oily stuff. And so it is, if it is not treated properly. In the first place, as a rule, it is not sufficiently dried. It needs far more drying than Coffee Arabica. This refers especially to coffee for the breakfast table, as distinct from coffee for the market. Then it is frequently drunk too new. It wants a lot of keeping. And finally the roasting must be done slowly and very thoroughly. If these points are well borne in mind, Liberian coffee will give as fragrant a cup as any other: and the quantity will go further. In short, point for point, and step for step, it has to fight the same battle that British-grown teas had to fight a quarter of a century ago.

NO MENTION OF COFFEE!

The forty-fourth Annual Report of the Ceylon Planters' Association should rank as an eighth wonder of the world. *There is no mention of coffee in it.*

OLD HAND.

PIONEERS OF CEYLON: THE MESSRS. HADDEN.

We stand corrected in some of the particulars given in our notice, respecting the younger generation. We stated that Messrs. Frederick and Frank Hadden, soon after their father's death became sole proprietors of the Hunasgeria estates. As a matter of fact they inherited their father's half-share in Kotiyagalla and the Hunasgeria estates, and it was not till some years later, that they sold their half-share in Kotiyagalla to Mr. Chas. S. Hadden and bought his share in the Hunasgeria estates, in which properties Mr. Frederick Hadden was interested till January 1st 1893, when he sold his share in Weygalla, as also did his brother, to Mr. Beilby. On the same date, Mr. Fredrick Hadden sold his share of Hunagalla, Horagalla and Halgalla to his brother. We were wrong in describing Mr. Frederick Hadden as Mr. Charles S. Hadden's nephew: he is his cousin or cousin one remove.

BLACK ANTS.

A lady residing in a dry, lowcountry district, writes:—

"Could any of the readers of the *Observer* kindly inform me how to destroy or prevent the inroads of big black ants? Nothing seems to escape them here:—piano, bookcases, table, drawers, flower pots, &c., and I would be thankful to know of some good remedy."

We trust some one or other of the following hints will be useful to our Correspondent:—

HOW TO PREVENT ANTS FROM ATTACKING SUGAR.—Some of your lady readers will no doubt be glad of this hint, the utility of which I can testify to, and

which I discovered by mere accident. Put your sugar (I mean the small quantities required for daily use) into bottles or other narrow-mouthed vessels, and use a common lime well squeezed in for a stopper and ants will never trouble it.—*Demerara Gazette*.

TO PREVENT ANTS FROM GETTING ON WASH-STANDS AND DRESSING TABLES, &c.—Rub chalk round the legs of these a little up from the floor, till the wood is quite covered with it, and the ants cannot walk over the chalk. It must be renewed every week or so. Another plan to prevent ants getting on the table, teapoy, bed, &c., is to tie round the lower end of the leg or post a thin slip of flannel dipped in castor oil—they will not pass over this; or place the leg in pans of water. To secure boxes from their depredations, the best plan is to place them on glass bottles laid lengthways, and if kept free from dust, the ants cannot ascend. They have a great dislike to indigo, and will seldom touch cloth dyed in it or saturated in a solution of corrosive sublimate; the proportion of one pound to four gallons of water is sufficient. They also dislike salt, which may be mixed up with the mud or gober that is sometimes spread over the floor or wall; though this is not an effectual remedy, it is as well occasionally to adopt it.

TO DESTROY RED OR BLACK ANTS.—After having discovered the aperture of their nests, surround it with soft clay formed into the shape of a funnel, and pour in boiling water. Where they are in the habit of infesting a floor or room, lay down thin slices of raw meat or liver, upon which the ants will soon congregate; let a person go about with hot water in a basin, and throw in the meat as it is covered; then shake it dry, and put it down again to collect more.

A RECIPE FOR THE DESTRUCTION OF INSECTS, which, says the *Builder*, if it be one-half as efficacious as it is stated to be, will prove invaluable, and especially we may add in tropical countries, is published by the *Journal of Chemistry*. Hot Alum Water is the suggestion as an insecticide. It will destroy red and black ants, cockroaches, spiders, chintz bugs, and all the crawling pests which infest our houses. "Take 2 lb. of alum and dissolve it in three or four quarts of boiling water, let it stand on the fire till the alum disappears, apply it with a brush, while nearly boiling hot, to every joint and crevice in your closets, bedsteads, pantry shelves, and the like. Brush the crevices in the floor of the skirting or mop boards, if you suspect that they harbour vermin. If, in whitewashing a ceiling, plenty of alum is added to the line, it will also serve to keep insects at a distance. Cockroaches will flee the paint which has been washed in cool alum water."

TO DESTROY INSECTS IN FLOWER-POTS, GRUB, &c.—A plant grower of considerable experience tells us that a strong solution of copperas in soap-suds water is very invigorating to ornamental shrubs and pear trees. It will also destroy the small grubs that infest the roots of pot-plants. Ammonia water, of the strength of one teaspoonful of spirits of ammonia to two quarters of water, is also a good remedy for the white grubs in pot plants, while it is very invigorating to the growth of the plants.

"THE CREEPING OF CHUFFLES" AND OTHER STORIES BY OSD. SLADE.

A copy of this brochure—very neatly turned out in paper cover from the local "Times" press—reached us today with the compliments of the author. His purpose in the chief story which gives its name to the volume is to illustrate "in narrative form, the kind of life which young men, coming out to learn Tea Planting, are so often unprepared for. But there, the purpose, if it has one, ends: and it is hoped that these 'yarns' concerning various phases of life and incident to be found in Ceylon, may be as interesting to those who live among them, and to those who so imperfectly visit them, as to those whose business or pleasure do not bring them so far East." From

the glance we have given over the "Creeping of Chuffles" we think Mr. Slade has succeeded very well in his aim, while in his autobiography as well as in the succeeding stories he touches on phases of estate, village and native (Sinhalese as well as Tamil) life in a way that makes his pages both interesting and amusing to the general reader. The contents of the little book give a good idea of the treatment of his principal subject:—

Again, the preface indicates the humour of the writer and his style otherwise, very fairly:—

PREFATORY FABLE.

To those of my country-men and women—and there must be many—whom the title of this little volume may tend to mystify, a word in season.

'Creeping!' What does 'creeping' mean?—And thereby hangs a tale.

There was once a Ceylon Planter who took upon himself to teach a certain young man from England the profession of tea-planting. Whether the work, or the life, or both, suited this young 'blade' or not, I do not know—possibly not. But history relates that the planter's lady, seeing one day the new arrival lounging lazily along some estate road, exclaimed of him:—"There is that youth again, creeping—creeping along as if, &c., &c.,—!"—So many young men have come out to Ceylon (in particular) to learn nothing, or merely for the 'fun of the thing, or because their parents dubbed them 'fit for nothing else,' or because the old country was 'too hot to hold 'em!' Everyone knew instances of the kind, and few of these ever did any work; although their parents had paid a premium (often a heavy one) for the privilege of inflicting the Colony with their 'ne'er-dowels.' They should henceforth be called 'creepers.'—Time alters all things.

Nowadays the name 'creeper' implies 'a young man being taught planting,' and is a term almost exclusively applied to those who 'learn, and do not earn.'

The truth of this story I will not vouch for: let it stand for a simple explanation of an ambiguous term.

AUTHOR. Kegalle, Ceylon, 1898.

INDIAN TEA IN FRANCE.

TO THE EDITOR.

SIR,—I have read with considerable interest your article upon this subject, and, as a resident for many years in France, should like to state my experience in this connection. Although I have no statistics in my possession, I can assure you that tea is now by no means a strange commodity in Paris, nor at the many places in the south of France, where English-speaking people most do resort. Indeed, comparatively large quantities are now landed at and distributed from Marseilles, almost every week; and the quality is all that can be desired, though prices are exorbitant. After making sure that the tea shall be sold at a moderate profit, the great difficulty is to educate the French servant how to brew it properly, and this is no small trouble even amongst

English servants. In going about the Continent we adopted the general custom of drinking the red wine at meals, but we like to have a cup of tea during the afternoon, and generally got it; but then we took care to have a small canister handy, and my wife brewed it herself. I remember that at two places we ran short, at Toulon and at the university city of Montpellier, and at those places—I am speaking of seven or eight years ago—we managed to get very small quantities at chemists' shops, sold as a drug, and exposed in the window in glass jars with loose lids. There are at Paris a few shops selling tea and coffee as specialities, and tea can be obtained at a limited number of establishments (tea rooms) at from 25 centimes to 40 centimes a cup; these are principally patronised by ladies out shopping, but, except in aristocratic or wealthy families, it is rare to find a tea-caddy in use. If you speak upon the subject, the lady will probably tell you that your tea is certainly delicious, but, with a shrug, add: "You know we cannot get our servants to make it like this." So that the mere exhibition of tea, or the giving or selling of cups of the beverage, is quite insufficient if the object be to bring it into general practical use. Then, again, even to English people, wine is so much handier, not requiring any manipulation beyond the water bottle, and very decent wine can be had at the equivalent of about Re 1 per gallon. As to prices, good tea is obtainable in France at from 12 francs to 20 francs per kilo, and it must be borne in mind that the French customs duty is 208 francs per hundred kilos when imported direct from the producing country, and 268 francs per hundred kilos when received from European entrepôts; but even then first-class teas should be saleable at 8 francs per kilo, of, roughly, 2 lb. It will take a long time to create a large demand for tea, unless the servant is *educated*, and that can only be done by practical demonstration; and it is not many shop-keepers (or tea-dealers) who will take this trouble. It ought to be a special business in the hands of interested promoters to be even moderately successful. I remember at Montpellier our landlady had a sick headache, and would take some tea as a *tissue*. Being curious as to her methods of making tea, I watched the process, and to my astonishment I saw her take a pinch between two fingers from a small box, holding, perhaps, half an ounce, deliberately put this into cold water in a very small sauceman without a lid to it, and she did not even trust this operation to her domestic. This may possibly be an exaggerated case, but it is typical of tea-making in France. You make a point of sending free samples to hotels. Most hotels keep tea. I know one that takes 200 to 300 lb. at a time, but they do not know how to brew it into anything like a satisfactory beverage, and it is a delicate matter to tell them so. I should not mind having a hand in this educational process, but it will require lots of tact to get the mistress to send the domestic—even when the latter is willing—to take a practical lesson in brewing tea. Opening shops in thickly populated centres for the sale of tea should be a self-supporting and paying venture, and the first outlay in establishment charges, stocks, and judicious advertisement, ought not to be a ruinous matter, for much larger profits are possible in France than is the case in England. I doubt the necessity of sending out Indian servants even to the proposed Exhibition: a couple, for effect, might perhaps be useful, but I consider the expense unnecessary, as there are plenty of English girls, a grade or two above the servant class, quite able and willing to make tea properly, or to learn how to do so. I trust this letter may be of service in a practical sense. W. S.

—*Indian Agriculturist*, April 1.

THE OLDEST PARA RUBBER TREES in the Kalutara district are on the Culloden estate, planted we believe by Mr. R. Morison so far back as 1833. Three trees dating from that year are described as giants, and the seed from them ought to be specially valuable.

TEA IN THE KANGRA VALLEY.

REDUCTION IN RAILWAY RATES ASKED FOR.

The Kangra Tea Association is young; and, being young it has evinced its vigour by approaching the Financial Commissioner of the Punjab with a deputation which submitted a statement of the requirements of the tea industry in that salubrious valley. "The tea industry of the Kangra Valley has fallen into such a critical state," said the memorandum, "that unless some amelioration takes place in its circumstances, ruin must speedily follow." This was certainly not a cheerful view of the situation; but the Association was apparently justified in lamenting over the departed glory of the valley. Thus, it was stated that "green tea is manufactured almost exclusively by natives, and black tea by Europeans. The present market value of green tea, which used to sell at a rupee per pound twenty years ago, is two annas per pound at Palampur. Black tea, which twenty years ago was fetching a rupee per pound in Calcutta, now obtains with difficulty an average of about five annas per pound and deducting the cost of freight, sale charges, and packing in lead, this represents about 3½ annas per pound at Palampur. The lowest cost of production is 3 annas per pound for green tea, and 4 annas per pound for black." The memorandum then quoted figures in support of this, taken from the working of one of the tea estates, to show that it here, at any rate, realised a profit of only 3 per cent in two years. So much for tea gardens under European management.

On the other hand, gardens under native management, which manufacture only green tea, suffered equal loss; and the most curious feature of the memorandum presented by the Association is, that attention was drawn to an injustice perpetrated against the native growers. It was pointed out that while European planters paid only twelve annas per acre as Government revenue for their holdings, native planters were assessed at one rupee per *ghumao*, which was only one-fourth of an acre, and that the loss sustained on working by these native planters varied from Rs 10 to 15 per *ghumao*. "This," said the Association, "presents a positive injustice in the incidence of land taxation, and to it this deputation desires to draw your attention." It seems to us that the European planters can scarcely complain if their tea holdings are assessed at rates more favourable than those of the native planters. But apparently the European and native planters have joined issues—hence this united action. Indeed, the deputation seems to have held a brief for the native tea planters. What the deputation was really leading up to, comes out at the end of the memorandum, for what they wished to press was "the desirability (in the interests of the industry started by Government) of suspending all, or a portion of, the land revenue on tea lands during its present life-and-death struggle for existence;" that should an improvement take place, taxation could be reverted to. A reduction in the rates charged for the carriage of tea on State Railways in the Punjab was also asked for. Summed up, the prayer of the deputation was not for any particular concession to the European tea planter, but to the native; and the reason for this is found in the statement that an attempt was being made to find new markets for green tea in Central Asia. No doubt the tea industry in the Kangra Valley suffers from an absence of proper roads and facilities for placing it on the market, and this will doubtless receive the attention of the authorities. It may interest some of our readers to peruse the letter which we reproduce elsewhere from a correspondent of the Allahabad paper on this subject.—*Indian Planters' Gazette*, April 2.

RUBBER.—As information has been received from the Collectors of various districts in the Protectorate that Rubber is procurable, and as it is, of course, very desirable to encourage and develop such a valuable industry, H. M. Acting Commissioner desires that Collectors will do all they can to foster this industry, by informing natives that they may pay their Hut Taxes in India Rubber, reckoning it at a value of 9s per lb. the price quoted by the Zomba Agent of the African Lakes Corporation, Limited.

INDIAN TEA: EXPORTS FOR 1897-8.

CLOSE OF THE SEASON: INCREASE OVER
1896-7 ONLY 1½ MILLION LB.

Messrs. W. Moran & Co.'s Calcutta Circular of 7th April gives us the total exports for the past season and previous two seasons as follows:—

Total quantity of Tea passed through Calcutta from 1st April to end of Season:

	1897-98.	1896 97.	1895-96.
Great Britain ..	133,782,962	132,599,882	121,174,380
Foreign Europe ..	797,313	439,800	276,333
America ..	2,086,369	1,937,799	1,086,419
Asia ..	3,601,532	4,415,342	5,135,727
Australia ..	6,802,579	6,171,380	6,845,327

147,070,755 145,564,203 134,518,186

It will be observed that the increase last year over 1896-7 is only 1,506,552 lb. As regards the coming season, the circular before us has the following:—

Shortly after the date of our last, rain was reported from *Cachar*, but not in sufficient quantities to be of much service. By letter we hear that rain is again badly wanted, but by telegram we are informed that slight showers have fallen near *Silchar*. In parts of *Assam* there has been good rain, also in the *Dooars*, but in this latter district accompanied in some instances with hail which has done some damage. A few gardens in the *Terai* and some in *Dooars* are well ahead of last year in manufacture but on the whole, the season is not likely to be early.

PLANTING NOTES.

FINE COFFEE BLOSSOMS are reported from Uva—one planter writes that he wishes now he "had 1,000 acres of the old King"! The great question in Uva seems to be how to get cheaper rice for the coolies and cheaper transport for tea—every fraction per lb. being now a consideration in striving for a profit.

THE "TROPICAL AGRICULTURIST."—Major A. J. Boyd, writing from Brisbane on March 22, says:—"Since taking possession of the Editorial chair of the *Queenland Agricultural Journal* in May last year, I have had the greatest difficulty in obtaining your most valuable and interesting Magazine. I consider it one of the best, if not really the best of Tropical Agricultural publications and I derive a vast fund of information from it. I find that other officers of the department hold the same opinion."

WEST NYASA.—Mr. C. A. Cardew reports that Mr. A. Estermann, and Mr. A. Watkinson, are making rapid progress on their new plantations at Kawia, ten miles south of Bandawe. They are very confident of the suitability of the land for coffee culture. Mr. Estermann has 600,000 pits ready, and these will be all planted during February. Mr. Estermann has also gone in for rubber cultivation, and has collected some 2,900 lb in the last two months. He is confident that rubber culture will prove a paying industry. It costs about 4d per lb to collect, and the creper from which the rubber is obtained is plentiful in the district. If a specimen of this rubber and the creper are sent to this office they will be submitted to the Scientific Department in the first instance for the purpose of comparison with the rubber vine at Chikala, and afterwards for the opinion of an expert at home in regard to quality and actual value. Plumbago is to be obtained in abundance from the vicinity of the Bua River. A specimen of plumbago was recently sent home for inspection.

CHIKALA.—Mr. George Hoare is making an exhaustive census of the Chikala sub-district. He reports that rubber is plentiful at Chikala, of the same kind as the Mangoche rubber. The sample sent in is much whiter than that usually obtained from the landolphia creeper. I have sent a specimen of it to an American expert for a report on its value, and some hints on the best method of obtaining it, as well as suggestions for the proper cultivation of the vine itself. The result will be published in a future number of the Gazette.

THE COFFEE MARKET AND BRAZIL CROPS are thus discussed by Messrs. I. A. Rucker and Benecraft's on March 24th:—

Today, for the first time, we can talk of 9,000,000 bags (Brazils) receipts as an accomplished fact, and it only remains to be seen how far we eventually exceed 10,000,000 bags for the whole season. We have therefore entered, as it were, an unexplored country, and we can only hope that extremely low retail prices may become current in Europe, and that increasing consumption may successfully grapple with these enormous crops. The receipts are very heavy at the moment, 42,000 bags on Tuesday upsetting many expert calculations, and values on term and the Brazils are lower. We hear little or nothing about next crops, but it seems to be accepted that they are smaller than current ones. The spot market is lower. The fancy values current at the commencement of the season, in a majority of cases having disappeared. We may go lower, but it has to be remembered that the Java colory crops are very short, and colory coffees will be scarce in the late autumn.

MR. GEO. CHRISTISON, the well-known Darjeeling planter, whom, writes *Planting Opinion*, we unfortunately missed during his short stay in Coonoor, gives his opinion thusly on Nilgiri tea: "I like your district in many ways. Your soil generally is very good and your tea looks healthy and well. Of course without being with you all the year round, I cannot form any very reliable opinion . . . As you must know your tea has not been in good favour in the London market. This may, I think, be remedied in some measure." We quite agree with Mr. Christison. The capabilities of the Nilgiris are shown in the success of perhaps only two or three gardens at most. The soil is good, the climate very good, but the jat is—mostly—vile. Until a fuller appreciation is shown of the virtues of a better jat of tea than is now commonly grown on the Nilgiris, and until the present style of three acres and a factory are given up the prospects of the Blue Mountains as a modern tea district, will remain ultramarine.

A CEYLON PLANTER ON OUR COFFEE INDUSTRY.—We had a desultory talk with Mr. Trubridge shortly after his arrival in Blantyre in which, although it was not a formal interview he gave his opinions very freely as to the Coffee Industry of B.C.A. He had just come straight out from London and his object was to see and report upon the suitability of B. C. A. as a field for the investment of capital in coffee and he would probably make a six months' stay in the country. Coming to the subject of coffee, Mr. Trubridge stated that he had seen some fine plantations and as regards fertility of soil, plant growth, climate, rainfall, etc., he thought this was an ideal country for coffee. He was, however, very much disgusted to see how the weeds were allowed to grow up in many gardens and stated that weeds were a prolific cause of light berry. A special point to which he had directed attention was the presence of disease in the coffee. He said he had looked minutely for any trace of leaf disease, and (our Indian friends please note) had not so far seen a single speck of it. Mr. Trubridge has formed a most favourable idea of the capabilities of B. C. A. as a coffee growing country judging from the little which he has seen.—*Central Africa Gazette*, Feb. 26

PRODUCE AND PLANTING.

REGULATION OF SALES.—At a Committee meeting of the Indian Tea Association held on Tuesday, approval was given to the following notice, which has been issued to the trade by the Tea Brokers' Association of London, with reference to public auctions of Indian tea: "For the better regulation of sales, Indian tea importers have agreed to adopt the following rules: 1. That Indian tea sales be held on Mondays and Thursdays during eight months of the year, and on Mondays only from the first Monday in April until the last Monday in July. 2. That the quantity limit for Mondays be from 25,000 to 30,000 packages regulated so as not to require the sale to be continued later than 4 p.m. 3. Any surplus unsold from Monday's sale shall be offered on Wednesdays, no catalogue to be printed for Wednesday. 4. Small breaks appertaining to the tea offered to be sold at the close of each day's sale.

TEA CULTIVATION IN THE SOUTHERN STATES OF N. AMERICA.—The sale of Indian and Ceylon teas in the United States is not likely to suffer on account of the development of home-grown tea, for at present the experiment does not meet with any marked success. The British Consul at Charleston states that an experimental tea farm is conducted by Dr. Charles U. Shepard, at Pinehurst, Summerville, South Carolina, twenty-two miles from Charleston, under the auspices of the United States Government. The results appear to show that although it is possible, under such careful cultivation as Dr. Shepard has given to the plants under his charge, to produce in that climate a fairly good quality of tea so far as appearances go, no serious competition with imported teas is likely to arise. The product of the South Carolina farm has been sold for two or three years for 1 dol. per lb. (equal to about 4s), but the beverage made from this article had a yellowish, muddy colour, and a weedy taste in comparison with the ordinary grades of Chinese and Ceylon teas sold in the market.

PLANTING OPERATIONS IN EAST AFRICA.—In 1891 an Indian planter, Mr. W. W. Fitzgerald, was engaged by the British East Africa Company to establish experimental plantations on the coast lands, and to examine the soil of the great unexplored tract that lies between Lamu and Port Durnford. Mr. Fitzgerald has just issued a book entitled "Travels in British East Africa, Zanzibar, and Pemba," in which there is an account of his labours. The Arabs had already established plantations in the neighbourhood of Melindi, but with the abolition of slavery, large tracts of land were falling out of cultivation for want of labour. There were, however, settlements of runaway slaves who were induced to engage as plantation hands by the novelty of a promise of wages, and Mr. Fitzgerald, with that rare combination of tact and kindness which was conspicuous throughout his dealings with the natives, had a strong and loyal body of labourers at work upon the land within a few months of his arrival. While his crops were ripening he scoured the country in search of other promising fields, with his eyes always fixed upon the main object of his expeditions. Mr. Fitzgerald takes a cheerful view of agricultural prospects. In the Sabaki Valley he found a soil in which cotton, tobacco, sugar, fibre plant and coconuts, flourish with equal luxuriance, which can be tilled with a light bullock-plough, and is never subject to the long droughts of the Indian plains. But the planter has to contend with his old enemy—the dearth of labour. Mr. Fitzgerald would apply the old panacea—the importation of Indian coolies, but he does not say how the Indian Government is to be induced to waive restrictions and safeguards that are greater than any Protectorate is in a position to give, or how, with a minimum wage of shilling a day added to the cost of introduction, housing, and hospital, the East African planter is to compete with the Indian. With the exception of rubber, British East Africa does not produce anything that cannot be grown in tropical countries where the labour difficulties are

less acute, and what has failed to pay in them scarcely likely to prosper in a colony where the conditions are less favourable.—*H. & C. Mail*, April 1.

CURIOS—AND CEYLON TEA.

LONDON, April 1st.

Messrs. J. & M. L. Tregaskis, the well known antiquarian booksellers of High Holborn had lately a carved coconut for sale, described as follows:

1950 Coconut Flask, carved, with stopper, 7iu high, 10/6

On one side a lady with a bottle, parting with a soldier holding a glass, beside a ship; on the other, an elephant with rajah in howdah and other figures, royal crown and Ceylon. Also the verse:

"The mother of me is a coconut tree,
Her liquor is excellent sound;
Arrack and toddy proceed from her body,
So drink and be merry all round."

ADVICE TO CEYLON TEA PLANTERS.

There are many complaints by tea buyers that CEYLON TEAS are not leafy and whole, but are too much broken. Lately a London firm sent a crack orange pekoe to the Continent and heard that the purchasers had to sieve out the dust before it would sell. A small, well-twisted leaf, free from all dust, is the tea to sell at present. Far too much "broken pekoe" is shipped, buyers here are no fools, and know that when 75 per cent "Broken Pekoe" is shipped, it is only a name. Above all, make planters burn the "Red Leaf" and other trash too often shipped, and which is only fit to be condemned by H. M. Customs. It gives a bad name to all Ceylon tea and does not pay. If planters would agree to pluck finer and reduce the yield by 20,000,000 lb. they would not have to cry out about prices. A few years ago Oolongs were occasionally shipped. If carefully made, and in very small quantity, these would pay, but the demand is limited.

COFFEE IN BRITISH GUIANA.

Land of Canaan, D. R., 22nd Sept. 1897.
S. Bellairs, Esq., Hony. Secretary,
Agricultural Committee, Georgetown.

Dear Sir,—To procure a good sample of Liberian coffee, sweating is absolutely necessary. The berries must be fully ripe before they are taken from the trees. If the weather is wet, the berries as they are taken from the trees, may be made up in heaps in some shaded part of the field. Each heap should not be less than three feet high by five feet wide. The berries so heaped should be covered with plantain leaves and allowed to remain from four to five weeks, by which time the pulp should be black and soft, and the sweating is then completed. The pulp should be washed off and the berries dried and prepared for use. If the weather is dry, the berries should be taken from the field and placed under cover and the heaps watered and covered with plantain leaves. The heaps should be watered every second day, with a watering pot, the same as used for garden work; heavy watering will injure the sample of the berries. After fermentation has fully commenced, the watering should be stopped but the berries must be kept covered until the sweating is completed. I will send for the inspection of your committee the following samples:—

Berries as taken from the trees.
Berries with the sweating completed.
Berries washed after sweating.
Berries dried and prepared for use.
Hoping the above will furnish the information desired,—I am, &c.,
(Signed) C. ROSS.

The Secretary read the following letter and enclosure from Dr. Morris:—

Kew, 29th October, 1897.

Dear Harrison,—I am in receipt of your letter of the 28th September, respecting the samples of coffee sent from British Guiana. The latter were duly received and I was greatly interested in looking over them. There is no doubt coffee can be grown in British Guiana. That was evident from the samples. But it was equally evident that the preparation of the produce is in a very crude and primitive state. In order to obtain a commercial opinion upon the various sorts of coffee, I selected two of the best of the Arabian and Liberian samples and forwarded them to Messrs. Lewis and Peat, the well-known Produce Brokers in Mincing Lane. I enclose their report. Considering the great fall in prices recently, this is a very promising statement. It is admitted that the coffee itself is good, but it has been so badly prepared that it has lost nearly one-half its value. You will notice that if the coffee had been properly prepared the market value would have been from 60s to 80s per cwt.

The suggestion in regard to shipping coffee to this country in parchment is one that should receive serious attention. You will find plenty of information on the subject in the *Kew Bulletin*. See June, 1893 page 123. I enclose one on Liberian coffee herewith. When parchment coffee* is cleaned in London, it costs only about 2s 6d per cwt. This is much less than the cost of clearing by hand and the product is of much greater value. Liberian coffee is not so readily cleaned; but it can be done. It would be of great service to those engaged in coffee growing to let this be widely known.

All that really need be done in the colony is to pulp the coffee. This is a simple process and several good machines are available to be worked by hand or by power. Particulars of suitable machines as used in Jamaica could be obtained from Fawcett

The suggestion made by Messrs. Lewis and Peat in regard to cacao is an important one. Cacao was very depressed not long ago, but it has apparently picked up again. There is always an ebb and flow in the price of colonial produce, but there is one matter always to be borne in mind and that is, a really good commodity well prepared and skilfully presented will always stand a better chance than an inferior one. I am glad to hear rice is being taken so vigorously.—With kind wishes &c.,
D. MORRIS.
Professor Harrison, F.C.S., F.I.C.

Messrs. Lewis & Peat to Royal Gardens, Kew,
6, Mincing Lane, London, E.C., Oct. 26, 1897.

Dear Sir,—We duly received your favour of the 23rd instant, with samples of coffee from British Guiana, which we have carefully examined, and beg to report upon same as follows:—

ARABIAN.—No. 1 Canal, small, broken, and very mixed in colour, some green and some foxy, apparently grown from East India seed and badly prepared, value about 38s to 40s per cwt. West Bank, ditto, peaberry, value about 55s to 60s.

LIBERIAN.—West Bank, mixed in size and very poor in colour, value about 38s per cwt. Essequibo River, good, bold, clean, and well prepared, value about 45s per cwt. In reference to the Arabian samples, it is quite evident that they have not been prepared in the right way. The coffee is a good deal damaged and broken in cleaning and of all colours. We would suggest sending home small parcels, well cured and dried in parchment that can be cleared here, taking great care that berries which have fallen on the ground and thereby spoiled are not mixed with the good berries. We should probably get a much better result.

Coffee, such as samples now before us, owing to the very low prices now ruling for Santos and Rio descriptions from Brazil, cannot possibly pay, but might eventually do so if cured and cleaned properly,

* I send a sample of parchment coffee in a separate packet by this mail.

in other words, good and fine coffees may keep up in value, and good ordinary sorts remain very low. Our opinion is that if a well cured sample could be produced it would bring 20s to 30s per cwt more, say 60s to 80s. At present there is no chance of Liberian going up, there is too much Brazil.

Have your friends thought of cultivating cocoa? We should recommend this if the ground is suitable. Present prices range from 65s to 75s per cwt and the prospects are good, whereas except for fine coffees the outlook is not bright.—We are, etc.,

(Signed) LEWIS & PEAT.

On the motion of Mr Messer, a vote of thanks was accorded to Dr. Morris for the trouble he had taken in the matter, the Secretary being directed to convey the same.—*Timchi*.

COFFEE.

The year is notable for a heavy decline in prices, due to an enormous increase in the crops of the world, only partially offset by an increase in the deliveries, which are reckoned as consumption. The latter shows an increase of over 7 per cent over 1896. The decline in prices has been most marked in Brazil sorts and lower grades of mild coffee. The average yearly cost of No. 7 Rio, in 1897, was 773 cents against 15 cents in 1896, a drop of 48½ per cent.

On January 1st 1897, the world's visible supply was 4,024,968 bags, since increased to about 6,500,000 bags, notwithstanding the gain noted in consumption. We have recently so fully outlined the position of coffee, and noted each month in detail the movement, that a further review at this time would be a needless repetition. The outlook is for a period of heavy supplies and low prices for at least two years to come. The aggregate of the world's crop is over 2,500,000 bags above present annual requirements.—*Hawaiian Planter's Monthly*, Feb. 1898.

MARKET FOR MINOR PRODUCTS.

March 26.

OIL CITRONELLA, is quiet at 1s 1½d per lb. on the spot. 308,402 lb. were shipped from Ceylon from January 1 to March 1, of which 199,592 lb. went direct to America and 102,733 to the United Kingdom.

OIL EUCALYPTUS, is in good demand and firmer, 1s 10d to 1s 11d per lb. is the price for good brands, and up to 2s 3d for special brands, such as "Platypus." There has recently been inquiry for oil containing about 50 per cent of eucalyptol, in view of the requirements of the new British Pharmacopœia.—*Chemist and Druggist*, March 26.

OIL OF LEMONGRASS.

Adulteration of this oil continues. Referring to the article by Mr. J. C. Umney in the *Chemist and Druggist* of December 18, 1897, a German firm of distillers confirm the observations therein recorded, and state that three kinds of oil may be met with in the market—(a) natural lemongrass oil, sp. gr. 0.9041, optical rotation—3 18°, and solubility in 70-per-cent. alcohol 1 in 3; (b) oil deprived of citral, sp. gr. 0.9102, which is insoluble in 70-per-cent. alcohol, and, being heavier than that solvent, sinks in it; (c) lemongrass oil adulterated with oil of lemon, sp. gr. 0.8886, optical rotation ÷ 18 20°, insoluble in and swims upon 70-per-cent alcohol. We also learn that *Andropogon citratus* D.C., the plant from which lemongrass oil is distilled, is now grown at St. Thomas in Portuguese West Africa, and the oil distilled from it agrees in physical characteristics with East Indian oil, but it is optically inactive. In our report of March 5 we mentioned the importation by Mr. Schlessinger of Tonkin verbena oil. This has now been chemically examined, and found to contain 70 per cent. of citral.—*Chemist and Druggist*, March 26.

OUR TEA INDUSTRY: CURRENCY AND EXCHANGE:

THE CHAMBER'S MEMORIAL.

The following notes which reached us from a responsible "City" man interested in Ceylon will, we have no doubt, receive careful consideration at this time:—

"Talking yesterday with one of the best informed and most largely interested men in the Ceylon tea industry he informed me that comparing 1897 with the year 1894 he calculated that the adverse influences at work last year meant altogether a loss of £1,300,000 as compared with 1894, made up thus:—

(1) Difference in exchange 2d per rupee	£250,000
(2) Extra cost of rice	600,000
(3) Reduced market price of tea	450,000
	£1,300,000

That is for Ceylon only and if these figures are anything like correct the matter is serious indeed. The tea industry could no doubt successfully combat and overcome the difficulties caused by items (1) and (2); but the most serious matter is item (3), because it is likely to be more permanent and to get worse rather than better.

"Surely it would be better for the Government to push on the inexpensive line to Awissawella and so assist the tea industry there rather than give precedence to the expensive line to the North with its very uncertain prospects? I am not a pessimist, but I cannot help thinking that the time has come for very carefully disbursing, or perhaps even husbanding the revenue of the Colony."

It may be questioned whether it would not be advisable to include some such comparison as the above, or as lately made between 1896 and 1897, in the Planters' Memorial to Mr. Chamberlain. It would be out of place in that adopted by the Chamber of Commerce, because the latter has to serve for the producing or at any rate, the exporting interests of the Colony as a whole. The Chamber's Memorial will be found below. It is, in our opinion, an honest straightforward document which he who runs may read, and we are especially glad to note that the non-consideration by the Indian Government of the interests of Indian producers—the silent but suffering millions—is brought out. Mr. Chamberlain cannot fail to see at a glance how the shoe pinches in the case of Ceylon and he ought to be all the more ready to make his influence felt on our behalf from the fact that no special remedy is suggested; but that the memorialists on this occasion place themselves unreservedly in his hands.

Reverting once again to the "tea industry" we must guard against the prevalence of an opinion that those of the planters who feel the pinch now, have the remedy in their own hands,—in other words that the advice 'to pluck finer and make better teas' applies to all who are suffering from the bad times, and are unable to make both ends meet. Such is not the case. There is a considerable extent of the tea districts where the planters have never gone in for "quantity"—simply because their soil was not equal to yielding returns over 350 lb. per acre,—and who have always done their best by the leaf they gathered. And yet, many of these are now realizing that tea production will not pay, do what they can, unless prices improve or exchange falls. For such, the visible means of economizing or improving are exceedingly limited if at all

existent. There are others who steering a medium course as regards plucking, complain of the cost of their transport, and say the railway could and should help them in this time of need. Of course, none of the lowcountry districts with their abundant crops of leaf are included in this category. To planters in the latter, as well as on plantations with virgin soil in higher districts, the counsel to pluck fine and improve the make and quality of their teas as a means of meeting the present hard times, may be very suitable. But, let Mr. Chamberlain and His Excellency the Governor understand that there is no inconsiderable acreage under tea in Ceylon whose owners may, before the year is out, require and deserve official aid quite as much as the West Indian sugar planters—if indeed their "case for relief" should not prove even stronger seeing that the direct occasion of their suffering is found in the action of the Indian Government in tampering with the Currency and forcing on the public an artificial, inflated and dishonest rupee.

THE EXCHANGE QUESTION.

THE MEMORIAL TO MR. CHAMBERLAIN.

The Right Hon'ble Joseph Chamberlain, M.P., Her Majesty's Secretary of State for the Colonies. The memorial of the undersigned inhabitants of Ceylon.

Respectfully Sheweth,

That they represent the General Community of the Island, embracing all classes, and that they humbly beg to set forth the disadvantages under which they are at present suffering, and the deplorable condition to which the producing and exporting interests of the Colony is being reduced, owing to the policy of the Indian Government in regard to the Currency and the resultant artificial rate of exchange and dearness of money.

2.—That this Colony is dependent on India in a very large measure for its labour, and for its food supplies, these having to be paid for in rupees. The currency of Ceylon is identical with that of India, and cannot now apparently be dissociated from it.

3.—That with interest and discount ruling as they are now, at about 15 per cent. approved security, in Colombo, and even higher in outlying districts, the severe strain is exercising such a very adverse influence, that no industry can for any lengthened period stand it, and that business of all kinds is restricted and is being gradually strangled.

4.—That the staple export products of this Colony are not grains or cereals which are cultivated annually, and which if found to be unprofitable from any cause one year, need not be cultivated the next, but consist of articles, the cultivation of which requires a large capital outlay, and which have taken years to bring into production. If, therefore, the cultivation of these products be rendered unprofitable—and over a large proportion of the cultivated area of the Colony this point is dangerously near—the land will have to be abandoned and the result would be the loss of capital that has been invested and of all the time and energy that have been spent. In a word, it would mean ruin to many of those engaged in these industries, and prove a serious loss to the Government and Colony generally. There might then be a recurrence of the calamities which afflicted the Colony after the failure of coffee.

5.—That from its dependent condition, and merely by its adoption of the Indian currency, the Colony is obliged to be a party to the arrangements which were proposed and carried out for the supposed benefit of India, and is without any apparent means of extricating itself from its present difficulties.

6.—That as the efforts to establish the Rupee at 1/4 under the present policy depends upon the success

attained in rendering it scarce, it is manifest that so long as this scarcity is maintained money will be dear, all business be carried on with difficulty and the prosperity of this island endangered.

7.—That they do not believe that the Indian Government anticipated this effect of its policy, and they would urge a consideration of the position on your part in the interests of this Island more especially, as, when the action was taken, from the ill-effects of which they are now suffering, the interests of the producers in India—largely consisting of uneducated natives unable to voice their own interests—were overlooked.

8.—That the producing interests of Ceylon, your Memorialists would point out, are overwhelmingly more important than any other, and these interests through the Colony's exports,—over two-thirds of which are sent to the United Kingdom,—suffer in a disastrous way from an artificially inflated rupee, since so many of its products compete with those exported by other countries using a silver currency based on silver bullion.

9.—That whilst fully recognising the difficulties of the Indian Government, your Memorialists are of opinion that any tampering with its currency must be injurious to the trade of this Colony, upon the prosperity of which all revenue, public and private, is dependent, and they pray that such steps may be taken, as may be effectual to afford them speedy relief.

INSECT-PESTS.

Miss E. A. Ormerod, so well known as one of the best authorities on this subject, has just issued her twenty-first report on injurious insects (Simpkin, 1s 6d). It is a book which is of decided value to chemists, especially those living in agricultural districts, who, if not actually consulted about the insect pests, are called upon to supply the necessary chemicals for exterminating them, and should be able to give an intelligent idea of the methods of using the various remedies. We have in this report, covering 1897, notes on thirty-six insects, and although during the year there was no special crop-attack spreading widely over the country, the infestations of orchard and fruit crops were unusually troublesome. Plum-trees were much attacked by the shot-borer beetle (*Xyleborus Saxosens*), large crops of strawberries were destroyed by ground-beetles (*Harpalus ruficornis* and *Pterostichus vulgaris*), and on black-currant bushes *Phytoptus ribis*, the currant-gall mite, was unusually active. We learn from the article on cockroaches that St. Bartholomew's Hospital has been infested with two separate species of these insects—the common cockroach and the German cockroach—each kind living quite apart, the German cockroaches eventually being driven out by the common variety or voluntarily migrated. It is with the remedies for insect-pests that chemists will be more concerned. Kerosene emulsion is frequently recommended, and as it is a somewhat difficult preparation to make except by methods well known to chemists, it should be a suitable article for retail trade. It is a preparation of paraffin, equally distributed by being mixed with soft soap and water. It is necessary that it should be made so that the emulsion will not separate, as paraffin itself is harmful to foliage. Another thing recommended as a top-dressing in some cases is kainite, the supplying of which seems to be drifting into the hands of seedsmen. Kainite is a salt of variable composition found in Strassfurt saltworks—it is potassium magnesium sulphate combined with magnesium chloride, and is represented by the following formula:—

Although a somewhat "heavy" chemical, there is no reason why the supply should not come through chemists. Other chemicals used are sul-

phide of calcium, bisulphide of carbon, and sulphate of iron. In the case of tobacco preparations, it should be noted that Messrs. Whiffen, of Battersea, now turn out large quantities of nicotine, the Excise authorities allowing them to use duty-free tobacco for the purpose, thus putting English makers on equal footing with foreign competitors.

We would recommend chemists in agricultural districts to read this book; there is much useful information in it, and many suggestions of commercial value to them for the treatment of many kinds of insect-pests.—*Chemist and Druggist.*

Gow, Wilson & Stanton's Report.

TEA REVIEW:

ANNUAL REPORT OF MESSRS. GEORGE

WHITE & CO., TEA BROKERS, LONDON.

We reproduce and issue as a *Supplement* the valuable Report received by a late mail from the above well-known firm of tea-brokers, and to which we direct the attention of all interested in our "tea industry." It opens with a review of the Indian, Ceylon and Java Tea Trade with the United Kingdom in 1897; and to take the last-mentioned first, we are glad to see that the said trade in Java tea is not increasing according to the landings in the United Kingdom. We have always insisted that with so good a market before them as Holland and Belgium (not to speak of the adjacent provinces of Germany.) the Java tea planters ought not to trouble the London market at all with their produce. In the year's review, we are shown how the Ceylon average has fallen from 8½d in 1895, to 8¼d in 1896 and to 7¾d in 1897; but in the interesting comparative table appended to the Report, the averages are given for eight months only in each case, namely 1st July to end of February and for 1897-8, the returns may be quoted as follows:—

All Ceylon	..	8d
All India	..	8½
All Java	..	6½

Now to take the Indian districts:—

Darjeeling	..	10½d
Assam	..	10¼
Doors	..	7½
Kangra	..	7¼
Cachar	..	7
Travancore	..	6½

The above is for 8 months; but we may compare this with the Ceylon district list for 12 months:—

Udapussellawa, Nuwara Eliya, New Galway and Dimbula	..	9¾d
Masketiya and Dikoya	..	8¾
Uva	..	8½
Eastern Districts from Maturatta to Rangala	..	7½
Central (Pussellawa, Ramboda, Pundalnoya, Kadugannawa)	..	7½

And so on—see thirteen divisions of districts—some of them rather arbitrary—as detailed by Messrs. Geo. White & Co. in their table. It may be mentioned that of the Indian districts Kangra Valley is the only one that shows an improved average—7¼d in 1897 against 7d in 1896. The slow progress made in the re-export tea trade from the United Kingdom is not satisfactory. In three years we might expect a greater increase than from 30½ million lb. in 1895, to 36½ in 1897 or 6 million lb. of an increase. As regards prospects, Messrs. White hope for improved trade and larger home consumption, last year being affected by industrial troubles; but if war breaks out, we fear, there may be disappointment. All the more reason therefore, that, by finer plucking and more careful treatment, a better average quality of tea should be sent home during the present year. To this end, the Report before us makes one practical recommendation, which deserves attention here and in India. Why, it is asked, should coarse and dust teas be sent to London to increase the supply of poor and low-class grades really not wanted at home? Can an effort not be made both in India and Ceylon, to encourage a local *native* consumption that would work off a large quantity, if not the whole, of these lowest

descriptions; and so relieve the pressure in packages and weight of descriptions of tea that it can scarcely pay, in any case, to ship to London, while prices are so low?

JAVA QUININE.

We have received this week from an independent manufacturer in Java a sample of quinine-sulphate made by himself. He says it contains "less than 1 per cent. of cinchonidine." So far as the absence of alkaloids other than quinine is concerned we find that the sample is good, and passes the ammonia-test; but the salt has in bulk a slightly yellowish tinge, although less so than another Java quinine, which was received here in January. We have submitted a portion of the sample to a well-known expert, who reports:—"It is evidently a very imperfectly refined product from a *Ledgeriana* bark. It might pass as 'unbleached quinine,' but it is certainly not of 'good commercial quality.'" Apparently, Java manufacturers have yet to learn the trick of how to make the sulphate absolutely white, and light as to density.—*Chemist and Druggist*.

BANDARAPOLA CEYLON CO., LD.

(Special Report for the "Tropical Agriculturist.")

The fifth annual meeting of this Company was held at 16, Philpot Lane, London, on March 31. Mr. George W Pain (chairman), presided, and among those present were Messrs. Hugh Fraser (managing director), Leopold F Davies, Menzel, Campbell, G G Anderson, A Leslie, W W Lord, W C Scott, J F Anderson, W Mackenzie and G W Dodds.

The CHAIRMAN said that the net profits for the year had amounted to £1,956 1s 8d, and the directors proposed to pay a final dividend of seven per cent and to write off for depreciation on buildings and machinery the sum of £295 1s 2d, carrying forward a balance of £66. They had had an average of 632 lb. per acre in tea, but the shareholders would notice that there had been a slight falling-off in the realized price. The directors had decided to incur no further expense for clearing for fresh tea while exchange was in its present unsatisfactory position, but they intended to continue to manure the estates freely (hear, hear). Except in that respect, and in regard to the ordinary expenses of the acreage now in full working order, they did not mean to incur any expense that could be possibly avoided till there was some settlement of the exchange question. They were able to pay the same dividend for 1897 as they had paid for 1896, although on an increased capital; and they had increased the reserve fund by £1,000 and written off nearly £300 for depreciation. The directors thought that, under all the circumstances, the report was a very fair one, and they felt that they were justified in thanking their manager, Mr. James Anderson, for the very satisfactory manner in which he had helped to achieve a very good result (hear, hear). He moved, "That the report and statement of accounts be received and adopted."

Mr. HUGH FRASER seconded, remarking that he considered they were in a very favourable and a very strong position. He did not think there would be any difficulty whatever in getting the shareholders to approve the report.

Mr. G. W. DODDS:—Is not the cost of manuring a very high charge? I see it comes out at about £3 10s 0d.

The CHAIRMAN:—It is artificial manure, and it is, of course, a very heavy charge. But the directors think it will repay the Company from the outlay (hear, hear).

Mr. MENNEL said he had sometimes had to offer criticisms (laughter) but on this occasion he saw that on the whole they had a very satisfactory report. Looking at the things that were hanging over their heads—the low markets and the high exchange—he thought the shareholders would have been quite satisfied if the directors had paid a slightly lower dividend and kept a little more in hand for the reserve fund. But they were always thankful for all they could get (laughter.) Looking at the political situation and at the state of things in Parliament he did not think they would be justified in looking forward to any alteration in exchange affairs—at any rate, not to an alteration that would better their position. Things were far more likely to get worse than better; judging by the feeling that was shown in officialdom and the state of political affairs generally he did not think there would be any move to better the position of the exchange.

A Shareholder asked for an explanation of the large item of expenditure put down for new lines and bungalows.

Mr. LEOPOLD F. DAVIES said he thought they ought to congratulate the directors on their decision not to clear any more land at present. He noticed that last year the amount of tea from the Company for home consumption was less than the quantity sent on the previous year. He hoped that the Chairman and all the Ceylon Tea Companies would address words of warning to their people against sending over too much tea, and against sending tea of inferior quality. In London what was wanted was tea of the best quality, not large quantities. The private garden owners were perhaps the worst sinners, and often sent over as much tea as they possibly could—and were not very particular what they sent. (Hear hear.)

The CHAIRMAN said with regard to what had been said about the rate of exchange, that the directors were somewhat of the opinion that there would not be a lower exchange; they would be glad if only they could know that it would remain at an average of 1s 4d. (Hear hear.) At any rate they had made their calculations on that for the future. They were doing their best in the matter to which Mr. Davies had referred; they were quite alive to the importance of it. Mr. Porter had made some suggestions to their manager, and those suggestions would no doubt be carried into effect. The suggestions included one for a better system of withering than they had hitherto adopted. Mr. Porter was confident that if the new instructions were followed they would be able to improve their tea to the extent of $\frac{1}{4}$ d. per lb. (Hear, hear.) A shareholder had asked about the expense on bungalows, etc. In the last report they had written off £500 on account of the old bungalows and they had had to set about erecting new ones. On this they had spent R21,270. Then on new lines they had spent R2,091, on the factory R6,249 and on machinery R6,894. The machinery consisted of a large engine that had been put up, and a new wheel for increasing the water supply. The factory was a large one, and was in a good position. An entirely new bungalow

had been built—a capacious one was necessary for so large an area of ground, and of course they wanted to make the managers as comfortable as possible (hear, hear.) All these expenses were considered necessary, and he could assure them that each item had been carefully looked into.

The report and accounts were adopted unanimously.

The CHAIRMAN moved: “That a final dividend be declared of 7 per cent, free of income-tax, payable forthwith, making a total dividend of 10 per cent for the year.”

This was also carried unanimously.

Sir GEORGE PILKINGTON was re-elected a director of the Company, the Chairman remarking, amid laughter, that Sir George was probably doing his duty more effectively in Ceylon than his fellow-directors were doing theirs at home.

On the motion of Mr. L. F. Davies, Mr. John Dalgleish, C.A., was re-elected auditor.

The CHAIRMAN moved a vote of thanks to the Ceylon and London staffs. The results, he said, were produced by the staff in Ceylon. In the London office, everything was done by the staff in the most capable manner, and he had always been able to get any information he required at a moment's notice (applause.) The best proof of belief in the fitness of the Ceylon manager, Mr. James Anderson, was that he (the Chairman) was sending out his son to work under him. He was starting for Ceylon on the next day (hear, hear.)

Mr. W. C. SCOTT seconded the proposition, remarking that he hoped Mr. Faine, junior, would add to their strength in Ceylon (hear, hear.)

The proposition was carried, and the meeting closed with the usual compliment to the Chairman.

PROGRESS OF TEA CONSUMPTION IN EASTERN EUROPE AND ASIA MINOR.

We are pleased to have a note from Mr. Marinitsch, dated Brindisi, April 3rd—he was on his way then to Vienna—and had experienced very cold weather just after leaving Port Said all along the Syrian Coast up to Smyrna. But the important part of his letter runs as follows:—“I am glad to tell you that the consumption of tea is visibly increasing all over Turkey, and that Ceylon sorts take a good share to meet the demand. It is amazing to see the progress, tea has made in the habits of the people inasmuch as at present, in some instances, tea is taken to alternate with coffee, it having dawned upon the people that tea when well made and *fresh* contains a good deal of stimulating power. Altogether you will be pleased to hear that people's tastes are now in that transitory stage which will ensure at an early date a larger consumption of tea and no doubt Ceylon's good qualities will give it the preponderance.”

ENTOMOLOGICAL SOCIETY.—At a meeting of this Society held in London on the 16th ultimo—Mr. R. McLachlan, V. P. and Treasurer, in the chair—a paper by Mr. E. E. Green, of Pundaluoya, Ceylon, entitled “Further Notes on *Dyscritina*, Westwood,” and illustrated by specimens and drawings, was read. The author had discovered two distinct species of *Dyscritina*, which he was able to keep in captivity and rear from the early larval stage to that of the imago. A discussion followed.—Local “Times.”

THE CURRENCY QUESTION.

A Ceylon estate proprietor, now at home, writing from London, by a recent mail, remarks:—

"We are all deeply interested, of course, in the silver question, but from what took place in the House of Commons the other night, it would not seem as if there is to be any immediate relief. You will hardly credit it, but I have learned that some people who must be deeply interested in the matter of exchange, and who from their prominent position might be of some assistance in obtaining redress, or at least lead an agitation towards the opening of the Indian mints, decline to take part in any such agitation.

"I have seen our old friend Mr. Sharpe, who is very anxious indeed to do something that would relieve us, and I dare say hopes, by means of the Committee appointed to enquire into these matters to aid us somehow. I must confess however that the flourishing condition of the Indian finances, as shown in their recently issued Budget Report, and the personal interest of those engaged in the affairs of that country, apart from the merchants and producers, prevent the former adopting or acting upon any view likely to relieve the land owners, and those whose welfare depends upon exchange being governed by the market value of silver as before. It would not matter so much if, as many at one time believed, a rise in exchange meant also a rise in the value of produce on this side; but at present at any rate, that optimistic feeling has been belied. Never I suppose has tea been so cheap as at present."

The Currency question was discussed by the Chairman Mr. C. J. Lindsay Nicholson at the general meeting of the members of the Agra Bank, Limited in London on 24th ultimo, when after dealing with the satisfactory business of the Bank in 1897, he continued:—

This bank has up till now done very well this year, and your directors are quite satisfied with the results. We have nothing to complain of so far; but it is impossible not to realise that India generally is suffering severely by the closing of her mints and the artificial forcing of exchange to 16d. It would ill become us to attempt to criticise the action of the Indian Finance Minister, Sir James Westland, as you may remember he was for some time a member of this board, and his colleagues were sensible of his undoubted grasp of all the difficulties of Indian affairs and finance. Still it must be felt that at the present moment the position of the Indian export trade is most serious and for the vast amount of capital invested in India and Ceylon in tea, indigo, and other products, the look out this year is serious. It has well been said that India's great currency problem can be solved by her fields and by her looms, and by them alone. I will read too extracts of trite remarks on the present position which must strike one forcibly. One is from Sir James Westland's speech early this year. He said:—"It must be understood that we are not rolling in wealth while we are refusing aid to others, and our inability to advance money is due, not to any wilful obstinacy, but to want of adequate means. The Secretary of State cannot draw on us for more than we are able to pay. The fear is, therefore, that the market may reach a point where money will become actually unavailable, and merchants will find it impossible to sell their bills." And very recently the President of the Calcutta Chamber of Commerce, speaking at its annual meeting, and I think most reasonably, said: "It is not for use to say by what plan a gold standard should be made effective but we can point out to Government that the present position is intolerable, and that it is clearly their duty, in the interests of their own finances and of our trade, to fix on a sound currency system." He asks that the Government plan whatever it may be, shall be published on the same day in England and India, and that time shall be given for its criticism by the experts and practical financiers of both countries before the scheme is adopted. He protests against delay in dealing with the question "not only because loanable capital is being

driven from India, fresh capital repelled and trade hampered by the uncertainty of the future, but also because recurring periods of monetary stringency which we have recently experienced are gaining in intensity and it is impossible to foretell what the effect on Indian commerce may be when we are face to face with the next period of stringency which under the present policy, is as certain to come as the sun to rise tomorrow." I cannot go into the currency question, which has been said by Lord Beaconsfield "to have caused more madness than even love did." Let us hope that amongst the multitude of councillors there will be wisdom.

EXCHANGE AND TEA.

Our hearty endorsement of the action of the Planters' Association, the Chamber of Commerce, and the general public at the meeting in the Council Chamber, does not blind us to a possible danger that may result to the island's Tea Industry as one result of such action. We say "possible," because injury to the credit of the island, or misapprehension of all the causes affecting the returns for our teas in the market, is improbable with those who have accurate knowledge of the industry and its exact position. It is only those who are ignorant of all the facts, who are liable to misread the information within their reach in a way prejudicial to the island and its industries. But we adhere to the view we expressed in a recent article, that the publicity that has been given to the drawbacks under which our tea industry is now labouring, is much to be preferred to the reticence which prevailed twenty years ago when our then leading staple, coffee, was threatened. The facts to be remembered in connection with the fall in the price of tea shares—and the fall has been by no means universal—are that it is due to more than one cause; that some of the causes are temporary and may possibly ere long disappear; and that the intrinsic value of tea plantations generally in a large proportion of districts in the island, remains much what it was before the scarcity of money and "hard times" set in some months ago. When any Company yields smaller returns than it has done for some years, its shares, if the necessity arises for offering them for sale, naturally fetch less in the market. The would-be purchaser looks at the last dividend, and sees no reason why he should pay for shares the price which the seller had paid in expectation of double that dividend. Then, if money is scarce, and if he has to borrow any part of what he wishes to invest in shares, he has to take that into account in making his offer; and the man who is forced to realize has, of course, to accept what is offered. Meanwhile, there are shareholders who are quite content with their investment, who have no need to realize and no desire for a change; and who still, possibly, value their shares at what they paid for them. Their tea, perhaps, fetched nearly the same price as the year before; and if the profits were less, dear rice afforded one explanation, high exchange did some mischief, and a bad season may have reduced the crop; but the bushes it may be are now responding to manure, and there is no reason why, with greater care in manufacture, the old dividend should not be declared again. In such a case as the illustration we offer, the Share List may prove a very fallacious guide to the real value of the property or the group of properties which is worked on limited liability principles, and so convey an erroneous idea to the outsider. With the stringency in the money market, and the exodus of shareholders to the

old country for a time, it is inevitable that shares should frequently fetch less than they are really worth, while the price originally paid during the rush may have been too high. We think it well, therefore, to caution outside readers against being led away by the notion that a fall in the value of shares, must necessarily, indicate a corresponding fall in the value of tea property. It is significant that we have had to chronicle the sale of an estate within the past few weeks, at £120 an acre,—albeit an exceptionally good estate in a very favourite district,—a price which if it has ever been exceeded, has been excelled only once and by a trifling sum.

The other point, which it is important to keep in view, is that high exchange is but one of the causes which have affected the diminution of profits from tea properties. We have already adverted to another—the high price of rice, due to the Indian Famine, aggravated temporarily by the Allagalla slip. But, on the other hand, as Mr. Renton rightly insisted at the meeting of the Chamber, greater economy and greater care in cultivation and manufacture are not only possible, but they must be enforced. The way we have fallen behind India is not at all comforting to proprietors; and although the increasing area in the low-country responsible for coarse teas, may, to some extent, explain the lower average, it can furnish no answer to the specific complaint that, in roll and appearance, our teas compare unfavourably with Indian makes of the same sort. We are aware that some of our planters consider the leaf crop from Ceylon soils can never be so good. But there is room for improvement in local arrangements and it is also a question how far judicious manuring may give a better leaf. Many thoughtful planters, among those who answered our circulars last year and those who did not, were strongly of opinion that more direct supervision was necessary, both in the field and the factory; and now that we are drifting into hard times, we are hopeful that every effort will be made to ensure improved teas with the utmost economy possible. Men who so exert themselves will have no cause for self-reproach should they, for any reason, be unable to show a profitable result, because this will be due to causes beyond their control.

“TEA PESTS AND BLIGHTS.”—For some time, we have heard very little of pests troubling the tea-planters in Ceylon and indeed with the prospect of over-production and the existence of low prices, there is not so much dread of the loss of a certain proportion of leaf. Still, no doubt there are fields and plantations still widely troubled by pests; and there has just appeared what must be regarded as the permanent standard volume on the subject. A copy has reached us from Calcutta today and it is entitled:—“The Pests and Blights of the Tea Plant being a Report of Investigations conducted in Assam and to some extent also in Kangra” by Geo. Watt, M.B., C.M., F.L.S., C.I.E., &c., issued by the Government of India. This is a bulky volume of 467 pages with a full index and table of contents. The eight chapters on tea pests are prefixed by an equal number on Indications of deterioration, ‘plant life,’ ‘seed gardens and improvement of seed,’ Hoing and Weeding, Drainage, Pruning, Planting, Tea Fertilisers. The volume is therefore a Manual for Planters, and it is one we shall doubtless have frequent occasion to refer to and quote after we have given Dr. Watt’s pages a careful perusal.

PLANTING NOTES.

DEMAND FOR RAW COTTON.—The *Kobe Chronicle* translates the following Tokyo press despatch, dated 29th March, from a venacular paper:—Owing to the scarcity of the stock of raw cotton, the cotton spinning companies at Osaka and other places have applied to the Nippon Yusen Kaisha that an extra boat be despatched to Bombay. Negotiations are going on as regards freight. The Nippon Yusen Kaisha will charter a foreign steamer for the extra trip.—*Hongkong Weekly*.

LOANS TO PEASANTS.—Cannot something be done for our peasants, to protect them from the usurer. We read in an Indian paper that taking advantage of the Agricultural Loans Act, the Chief Commissioner of Assam publishes in his provincial *Gazette* a code of rules under which any proprietor, landholder, or other occupier of arable land may borrow from the Government for agricultural purposes a loan not exceeding ₹300 at 6½ per cent per annum. The period of repayment varies with the purpose to which the loan is applied but is always easy. Loans made for the purchase of seed are to be repaid from the profits obtained from the crops so produced; loans for the purchase of plough cattle are repayable in three years; the maximum in any case is ten years.

THE SUGAR CRISIS IN MAURITIUS—is described as follows in the *Commercial Gazette* to hand today and has some points parallel to the case of Ceylon:—

There are some persons in Mauritius—among whom must be included our correspondent whose remarks on the subject appeared in our issue of the 4th instant—who take a pessimistic view of the planters’ chance of obtaining the loan of £400,000 which has been applied for. For our part we see no reason for supposing that Mr. Chamberlain will be less content to treat the position of the sugar industry in Mauritius with liberality than he is the West Indian planter. The conditions are analogous in many respects—the analogy is one instance being a depleted exchequer. As most people know, this state of affairs, in Mauritius, has been brought about, principally, by a short crop and the high price of the food which the country imports from India. Were the planters to obtain the loan of £400,000 it would not cover the deficit of 1897 crop. The real fact of the matter is, that the loan *must* be granted or great discomfort will prevail. Planters must have money to carry on their estates until the new crop comes in, and the money to enable them to do this is not in the country. This does not apply only to the estate proprietors who have liabilities to meet in the shape of interest and sinking fund, but also to those whose estates are unencumbered. It is only the interested, directly or indirectly, in Sugar Estates, who have any idea of the amount of money that is required “in advance” against a crop. Superintendence, cooly food and labour machinery, artificial manure, etc., have all to be taken into account. The loan of £400,000 has been applied for principally to improve the Sugar factories, but if its application be entirely restricted to this, other means will have to be found to provide monies for the upkeep of Estates until the crops come in. The yield for 1898 promises to be a very large one, and there is no reason why prices should go lower; so that making the necessary advances would not be hazardous. The question is:—where to find the spring to tap for the money to flow? So long as there are men like the Honourable Leclézio and Sir Virgile Naz at the helm of the planter’s bark there will be confidence and hope—it is to them that all eyes are turned to find means to relieve the existing difficulties. Before long we shall know Mr. Chamberlain’s decision as to the loan and we repeat, there is no reason to suppose it will be an adverse one—on the contrary he has said British Colonies, when in distress, must be assisted, and he is not likely to leave Mauritius out in the cold.

“THE WONDERS OF THE YANG-TSE VALLEY:”

“RICE FOR THE WORLD;” AND THE “HISTORIC TEA COUNTRY.”

Mr. Alfred Kinnear has supplied to the London *Daily Chronicle* a very striking account of the region bordering on the navigable portion of China's central and grandest river—a region, moreover, which will now be rapidly exploited by British merchants and capitalists; as it is bound year by year to come, more and more, under British influence. The prospect is one that concerns the tea planters of India and Ceylon very nearly; but it is also one that opens up the bare possibility of a connection between China and this Colony, leaving India out of view, which, without being sanguine as to its fulfilment, is at least worthy of consideration. The two great difficulties in the way of Ceylon adopting a silver currency of its own have always been,—how are we to pay for our Indian rice and our Indian coolies? Nothing, it is always said, but the currency of India would suffice for these two indispensable elements of the Ceylon Planter's existence, as matters stand at present. But how if we got our rice from the valley of the Yang-tse—which is capable of supplying the needs of the whole world with this staple—and paid for the same in the Ceylon dollar to be coined of the same value as the dollar current in China—in other words an honest silver dollar? It is of course a question which only time and practical experiments could answer, as to whether rice could be laid down as cheaply at Colombo by steamers from the “Yangste” as from the Hoogly, although surely “exchange” for India, would give the former a certain advantage? As to labour, the difficulty is greater. We gather that new regions are now likely to be tapped with millions of hardworking Chinamen, many of whom would come to Ceylon or elsewhere for much less wages than the Coast Chinamen have hitherto demanded. But we doubt whether, under the most favourable circumstances and with more and better work, the Chinaman would ever be so cheap as the Tamil cooly; while there would always be the difficulty of diverse races and how the presence of Chinese would affect our Sinhalese as well as Tamils. True, in the Straits Settlements, the “Klings” (Tamils) and Chinese seem to get on fairly well together, and we are anticipating that from the Yangste Valley, a quieter and more agricultural class of yellow labourers is likely to be available as emigrants. Be that as it may and remembering how, year by year, more and more of our Tamil immigrants seem to settle in Ceylon—15 to 20 per cent perhaps—would it be impossible to have the dollar and face the “exchange” question with “Ramasamy” so long as he had his rice duly supplied as at present? In other words when the time came for coolies to return to their country all that would have to be done would be to exchange their dollar-balance of wages for Indian rupees. Even now it is pressed urgently on planters to get their departing coolies to allow their money be remitted by postal order in place of risking the carrying of silver in their cloths. The Post Office then would have no more difficulty in granting orders in “Indian rupees” for the equivalent of “Ceylon dollars,” than for issuing sterling orders in exchange for our current rupees.

But leaving aside these questions of Currency, Rice and Labour Supply, there is another matter of unquestionable importance to our planters, arising out of the opening of the valley and border lands of the Yang-tse; for, these include the historic tea region of China, and with the progress already made on the Coast in establishing factories and securing machine-made teas, it is only reasonable to anticipate changes and improvements of special significance in the tea districts leading out from Hankow, as these come under the influence of British merchants, agents and possibly, of British tea planters working with an honest silver dollar at an advantage of 60 or more per cent over their brethren in India and (if it so be) in Ceylon. In proof of the importance of the advance and change that are fast approaching, we proceed to quote from Mr. Alfred Kinnear's paper, the portions which bear expressly on the fortunes of our planters in respect of their staple product, their rice, and labour supply. Mr. Kinnear writes:—

In the scramble for China Britain's place in the interests of herself and of the world is in the Yang-tse Valley. Even as it is, we dominate the most magnificent, most virile territory in the world. There is nothing to be compared with it, not even upon the banks of the great rivers of America. It is a territory of illimitable possibilities, for it constitutes all that is best worth having in China. It is the richest in the empire, and with its undeveloped opportunities the richest in the world. It is the tea-garden of the historic tea country. It is the birthplace of the discovery of silk. It cuts China in half, and it is a belt magnificent to the eye and jewelled with the brightest gems of commerce.

For 3,000 miles down to Shanghai, flowing between opulent valleys, the Yang-tse Kiang is nature's ready carrier for the produce of 700,000 square miles of the most wonderful soil in the world. There are points at which it expands into an inland sea, so that the traveller standing upon the deck of one of the many fine English liners that connect Shanghai and Hankow may look in vain for the banks that hedge this colossal artery. Then there are turns which suddenly switch the voyager into a defile of steep and rugged rocks, quaintly jagged, as with stony arms they would shake hands one frowning crag with another over the dark waters below.

The towns are numerous, and some of them are from a trading as well as a European point of view places of importance. But between them there are long tracts of open and wooded country glorious in its wealth of uncultivated vegetation, which only awaits reclamation by the pioneer. It might be made to grow

RICE FOR THE WORLD.

It grows wattles only. Wealth is a crime in China, and to conceal its possession is a virtue. The owner of the soil cultivates wattles because to cultivate rice would bring him under the suspicion of the Taotai, and subject himself to the “squeeze” of the tax gatherer. So he remains poor that he may remain untaxed. That is political economy as “she is taught” in China.

While at Tientsin I was carried by an eminent European resident into a native street, and was presented to a dismal individual in a squalid home, reeking in filth. My friend informed me later that I had been with a subject of the Emperor who might put down sovereign for sovereign with Lord Rothschild. He simulated poverty to escape the Taotai, who as it was taxed him and squeezed him on suspicious up to the income of an English Chancellor of the Exchequer. It is the fear of taxation that depresses native enterprise in China and keeps the valley of the Yang-tse for the greater part a glorious wilderness.

Vast quantities of game, wild geese, wild duck, snipe, and pheasant and deer abound about Chinkiang. The scenery almost throughout the entire length of the Yang-tse Valley, which for practical purposes begins at Shanghai and extends to Tchang is curiously English in tone. It is infinitely more English than

America. The landscape is suggestive of Berkshire, and recalls the fertility of the upper reaches of the Thames. The wilder intervals of the Yang-tse are picturesque rather than grand. But these passed, the scene relapses into the normal characteristics of a valley, and the eye may roam for miles over a varied

PANORAMA OF FERTILITY.

wood and glade in alternate profusion, until the vanishing perspective is lost in a blue streak low down on the horizon betokening a far away range of hills.

It will be observed by a visitor, however brief his visit may be, that at each of the river ports up to Tchang, British interests—I will not say British influence—are already in the ascendant. We hold three-fourths of every material acquisition held by the European community.

HANKOW IN THE TEA SEASON—

in the period when the growers send down the new crops of the year for export—is a scene of incredible energy and bustle and business. The fine roadstead which the river at that time of the year affords is crowded with a great fleet of steamers, but ninety-five per cent are under the British flag. The best of the tea exported to Russia goes overland, but on one occasion a magnificent vessel steamed up and anchored under the Russian flag, and she turned out to be one of the Volunteer Fleet from the Black Sea. She was heavily enough armed to have run amok of the river, and though her captain took on board a fair consignment of tea, it was suspected that her mission was rather in the nature of a reconnaissance than in the nature of peaceful trading. Hankow itself corresponds in every respect to the gospel of British monopoly of trade. The Yang-tse Kiang's total course is estimated at 3,600 miles. At low seasons the tide runs up for 520 miles, and beyond this point the river is navigable for 1000 miles.

*** To put it in a nutshell, the British ascendancy in China has grown out of the capitalised British investment of not less than £300,000,000 sterling. The centre of our interests lies undoubtedly in the central provinces of China, Shanghai, on the seaboard, and Hankow, 700 miles inland (with all the treaty ports lying within that strip) are

PRACTICALLY ENGLISH TOWNS.

The entire German population might be deported in a single steamer without inconvenience to themselves or their fellow-passengers. By the occupation of the Wu-Sung ports the mainstay of our trade in China, from Chefoo to Hong Kong, and from the sea to the confluence of the Yalong Kiang and the Kiu-Kiang, would be safe. We might then regard complacently Germany's "twelve-mile radius" at Kiae Chao and leave Russia tranquilly to rejoice in other sterile comfort of Port Arthur, for we should then dominate the most magnificent territory under the Eastern sun.—ALFRED KINNEAR.

"THE QUININE QUESTION."

This is the heading of an article in the *Chemist and Druggist* from which we learn that "two years ago a German professor estimated the world's annual consumption of quinine salts to be 7,000,000 oz., and those who were able to check him did not think the professor wide of the mark. This must now be taken as an underestimate, for in the year ending December 31st, 1897, the United States alone imported 4,364,823 oz. of quinine sulphate, and as a third as much is made in U.S.A. as is imported, it follows that the consumption there is well over 5,000,000 oz. a year. The rest of the world consumes somewhat more, as Java alone supplies 100,000,000 oz. of quinine sulphate in the bark yearly, and the supplies from other sources bring the total up to over 12,000,000 oz."—Our contemporary may see from our review in the "Ceylon Handbook and Directory" that so far back as August 1895, we gave statistics to show that the quinine

consumption of the United States was not less than five million ounces—or nearly half that of the world which we estimated (giving details for different countries) at close on 11 million ounces. No doubt in the two-and-a-half years which have elapsed, the consumption has increased to 12 million or more ounces. Mr. Joseph W. England, of Philadelphia, has been writing on the subject, and he reports that,—

Mr. England tells us that "since 1879 the United States has been the dumping-ground of Europe's excess of quinine." How long that will obtain is a problem—says our London contemporary—not that American manufacturers will increase their production, but because Java, as a quinine-producer has to be reckoned with. Nearly three years have elapsed since the foundation of the factory at Bandoeng, or, rather, Samarang, was laid, and the first consignments of quinine sulphate manufactured there are to be put forward to auction, one in London this week, another in Amsterdam next week. The Java people seem sanguine of success, as may be judged by the following glowing epistle which we have received from Amsterdam:—

"On April 6th twenty-one cases, each containing 12 kilo. tins of Java quinine, will be offered in public auction. This is the first import of the quinine manufactured in Java. According to the chemical analysis of Dr. W. F. Koppeschaar, the quinine is of excellent quality, and can compete with the first qualities of the European market. There is every probability that the Java factories will in the future continue to send considerable quantities of their make to our market, and they will be able to sell at a lower rate than their European competitors, because they avoid the great expenses of freight, commissions, &c., on the bark, and have their plantations at their door. Should the English market show sufficient interest in this quinine, we feel sure that we shall be able to get the manufacturer to put it up in a style suitable for that market."

Here are performance and a promise. The only comment that need be made in respect of the performance—i.e., the production of quinine in Java—is that they have hastened slowly, and they might, while they were at it, have made the quinine salt exactly as we like it—viz., in perfectly white, feathery crystals. It is almost impossible not to make chemically pure quinine from Java bark. The parcel of 10,000 oz. which comes up for sale in London today (Thursday) is accompanied by the following analysis from Dr. B. H. Paul:—

The sample of sulphate quinine (1 tin) received from Smith's warehouse gives on analysis the following result:

Water	15.4
Quinine sulphate	84.6

100.0

The quinine is of high-class quality."

This analysis has tended to prejudice the article in Mincing Lane, through no fault of the analyst, but because many who are interested in the article have looked upon the 15.4 per cent of water as a contamination. We may, therefore, explain that B.P. sulphate of quinine contains 15 molecules of water of crystallisation—i.e., slightly under 16 per cent of water, so that the Java article is excellent in this respect. But while the quinine is chemically pure as far as pharmacopœial tests go, it is in too minute crystals, and has a distinctly yellowish tinge, viewed by reflected light. The characteristics make it objectionable for general sale, and it is probable that it cannot be used for anything but manufacturing purposes. The result of the London auction will be noted in our trade report, and whatever that may be it is interesting to observe that, in Amsterdam, the price wanted (20 florins per kilo. = about 11½d per oz.) is too high to bring it into competition with German quinine. To get a footing Java quinine must compete in price as well as in quality. We see no reason why both should not be done, especi-

ally as the director of the Bandoeng factory said, when the unit was very low, that he could produce quinine sulphate at a cost of 3½d per oz. At present it is worth 6d in the bark, so that there is sufficient margin to make it merchantable and to cut the price—if the European makers do not get before Java on the latter point, which is not improbable, seeing that cinchona is cheaper again.

PLANTING NOTES.

"CHINA CLAY."—A New York trade journal reports a "strong market" for China clay for pottery purposes. With vessels running direct from Colombo to New York, it may pay to ship some of the deposits of "Kaolin" or fine China clay which are found at different points, especially in the Nuwara Eliya district.

CASTOR OIL PLANT FOR SILK WORMS.—I have three varieties of the plant here, seed as used in India for oil purposes. They grow promiscuously and come up spontaneously in newly cleared land, if I am not too low and too dry (35 inches rain in a year). I have at all events ample food free.—*Cor., lowcountry.* [An experiment is well worth making.—ED. T.A.]

NEW AREAS OF CULTIVATION IN THE N.-W. PROVINCE are thus given by Mr. King in his Annual Report:—

The cultivation of the coconut is advancing everywhere in those districts of the Seven Korales in which the rainfall is sufficient. It is difficult to arrive at the correct figures, but several thousand acres must have been added during the past year. It is also difficult to measure the advance of the swardmisation of land for paddy, but this should be put at not less than 1,000 acres. The area of tobacco land is also extending, particularly in Hiriyala. The extent under cultivation in the Seven Korales is given by last return as follows:—

Hiriyala	694 acres
Dewameddi	590 "
Weuda	157 "
Katungampola	50 "
Total	1,500

In the Chilaw district there are over 700 acres under this cultivation, and about half that area in Puttalam. [These figures are far below the fact.—ED. T.A.]

THE PROCEEDINGS OF THE INDIAN TEA ASSOCIATION which we print elsewhere, are—says the *Indian Planters' Gazette*—more than usually interesting. One of the important subject discussed was the connection between the mints and the planting community. We referred some time ago to the protest entered by the United Planters' Association of Southern India regarding exchange, and demanding the re-opening of the mints. The London Secretary of the Association having asked for the views of the Indian Association, has been informed that the General Committee of the latter entirely agreed with the Southern India Association and would be prepared to take up the matter. This announcement will be received with general satisfaction by the entire tea planting community of India. We have all along held the view that in the absence of a stable exchange, the salvation of the Indian planting community depended upon the re-opening of the mints. The rising exchange value of the rupee has had disastrous effects on the tea industry of Ceylon as we showed last week. Capital which ought, in the usual course, to have remained in the Colony, is being transferred to America.

DISHORNING DAIRY COWS.—The dishorning of cattle is a subject which may be said to be settled in the affirmative so far as the great dairy districts of Illinois and Minnesota are concerned. On approaching a farmer for his reasons why he dishorned his stock he stated that he made the cows more gentle and docile, and that he noticed somewhat of an increase in the milk yield since it had been done. The cows lost their fidgety, nervous appearance, and did not seem to be so much afraid of the leader of the herd. Removing the horns, when it is properly done by the Keystone dishorning knives made by A. C. Brosius, Cochranville, Pa. is not a painful operation, as is evidenced by the fact that it will scarcely interfere with the flow of a cow's milk as much as the chase around the pasture in the front of the farmer's dog will do. These best acquainted with dishorning and its results are its strongest advocates.—*Oregon Agriculturist.*

THE PARIS EXHIBITION.—We see it stated in the Indian Press that a "comparatively small area of the Exhibition grounds is to be set aside for the construction of national pavilions by such countries or colonies as care to build them. This is an opportunity of which India certainly ought to avail herself. One of the most interesting features of the Exhibition of 1889 was the Indian Palace, in which Indian tea was served to all and sundry by Indian servants. This enterprise was avowedly undertaken with the idea of encouraging a taste for Indian tea in France." Accordingly the *Indian Agriculturist* suggests that India and Ceylon should join forces to establish a permanent organisation in France to promote the consumption of British-grown teas. There are 35 millions of people, our contemporary says, to be won over to "tea," and already a good beginning has been made. As to the Exhibition itself our contemporary speaks well of the new arrangement:—

INDIAN TEA IN FRANCE.

It is to be hoped that the Government of India is already considering what steps shall be taken for the suitable representation of the great industries of this country at the Paris Exhibition of 1900. The matter will certainly require more careful handling than it did on previous occasions, because of the new system upon which this Exhibition is to be arranged. The French authorities have decided that, instead of grouping the various exhibits in sections, according to the countries from which they come, all exhibits of a similar character are to be placed together, whatever be their country of origin. This plan has the great advantage of enabling the visitor easily to compare the competing products of different countries; but it excludes the possibility of any one country making a general display of the whole of its industries. From this point of view, in fact, it may fairly be said that the Exhibition of 1900 will be the first really International Exhibition; for national differences will be ignored, and competing producers from all parts of the world will have to set their products side by side with the similar products of their competitors, apparently also the organisers of the Exhibition hope, by the adoption of this principle, to secure a more uniform system of arrangement and decoration, for in each section, whether it be steam-engines or perfumery, the French authorities are to be paramount. From the point of view of picturesqueness this will probably be a distinct gain, not because uniformity is a necessary, or even in general a desirable, element of beauty, but because of the undoubted artistic feeling of the French people. Visitors to previous Paris Exhibitions who can remember the contrast between the brightness of the French and the stodginess of the British sections, will be grateful for the fact that no British Royal Commission is again to be allowed to try its hand on artistic work.

SINHALESE TEA-MAKERS FOR CHINA.—Messrs. Molchanoff & Co., are advertising in another column for a thoroughly competent native tea-maker to proceed to China on a six months' engagement. We understand that they intend to employ the man, when they have selected him, at a factory belonging to themselves at Hankow, where they are about to erect proper English machinery for making tea.

BOLIVIAN RUBBER SYND., LD. (56,508).—Regd. March 15th, with capital £5,000, in £1 shares, to seek for and secure openings for the employment of capital in Central and South America or elsewhere, and to acquire, own, and work any rubber-bearing or other lands on the banks of the river Amazon or its territories. Regd without arts of assn. Regd. office, 22, Charter-house Sq., E.C.—*Investors' Guardian*, March 26.

PLUMBAGO AND SOME MINOR INDUSTRIES are thus detailed by Mr King in his Annual Report on the N.-W. Province:—

Of industries not elsewhere referred to, mention should be made of plumbago. The quantity of plumbago conveyed by rail out of the Province was about 4,000 tons. A large factory for the desiccation of the coconut has been established by Mr. John Clovis de Silva close to the town of Kurunegala, which gives employment to about one hundred persons.

A SIMPLE FIRE EXTINGUISHER.—Hand grenades, the simplest form of fire extinguisher, can be made at home cheaply and easily. And it is well to have at hand a simple contrivance for extinguishing at small fire at its start. Take twenty pounds of common salt and ten pounds of sal ammoniac (nitrate of soda, to be had of any druggist,) and dissolve in seven gallons of water. Procure quart bottles of thin glass, such as are ordinarily used by druggists, and fill with this, corking tightly and sealing, to prevent evaporation. In case of fire, throw so as to break in or near the flame. If the fire is in such a place as to prevent the bottle from breaking, as in wool or cotton, knock off the neck and scatter the contents. The breaking of the bottle liberates a certain amount of gas, and the heat of the fire generates more, thus working its own destruction.—*Diocesan Gazette*.

CHEAP COFFEE.—The very low prices now ruling for coffee forces the question. Has the decline reached its limit? During the era of high-cost coffee, which ended in 1897, the planting of coffee trees in Mexico, the Central American States, and the United States of Colombia was greatly stimulated, as it was in Brazil, that Colossus among coffee-producing countries, which produced a crop last year and this equal to nearly two-thirds the total production of the world. Brazil's vast production makes that country the dominating factor in the situation, so that any failure of the Brazil crop would mean a rebound in prices. Such prolific bearing as during 1897 and 1898 rarely continues for three years in succession. If history repeats itself, and the crop of 1898 '99 should drop back 25 to 33½ per cent. below the two previous crops, then coffee must advance. Below we present figures showing the Rio and Santos crops for ten years, and which demonstrate the fluctuations in yield and the probability of a sudden change from low to high cost within two years:

	Bags.		Bags.
1887-88	3,033,000	1892-93	6,202,000
1888-89	6,827,000	1893-94	4,309,000
1889-90	4,260,000	1894-95	6,695,000
1890-91	5,358,000	1895-96	5,476,000
1891-92	7,337,000	1896-97	8,680,000

American Grocer.

TEA IN AMERICA.—The following instructions were issued at Washington on March 5th by the Treasury Department:—

All teas arriving after May 1st, 1898, shall be governed by the new standards adopted for the season beginning May 1st, 1898, and ending April 30th 1899, excepting such teas as shall have been shipped prior to March 1st, 1898, which shall be governed by the old standards.

THE QUININE INDUSTRY IN GERMANY.—Some interesting figures are given in an article on this subject in the *Süddeutsche Apotheker Zeitung* last week. During the 10 years 1887-1896 Germany imported cinchona bark to the value of 35,500,000 marks, whilst her exports in this article were only 2,000,000 marks. Her exports, however, in quinine and quinine salts reached the enormous total of 58,000,000 marks, of which the greater part was to the United States, Russia, Italy, and Holland absorb large quantities also. The imported quinine totalled, during the decade in question, 2,100,000 marks.—*B. and C. Drug-gist*.

PLANTING REPRESENTATIVE.—Why do not the leaders of the indigo and tea industries (asks the *Indian Planter's Gazette*) insist on having a representative on the Bengal Legislative Council. The matter has been brought forward on several occasions, but been quietly shelved. Surely in a matter like the recent amendment to the Tenancy Act such representation would have been most useful. The industries are, we believe, important enough to be represented separately, but if that be not feasible, planters should not rest until they have some one who is qualified to speak on their behalf.

ALUMINIUM UTENSILS.—The attempt being made at the Madras School of Arts to introduce aluminium as a substitute for brass and copper in the manufacture of domestic utensils, seems, says the *Madras Mail*, to have got beyond the experimental stage. About fifty workmen have been brought up from the great metal-working centres of the Presidency, to work off the large number of orders which have been received from all parts of India, and it is expected that the number will soon reach one hundred. Arrangements have been made to secure a regular supply of metal, and any one desirous of testing the claims put forward for the new metal can place orders at the School of Arts with the assurance that he will not be kept waiting.

FRUIT TREES are in some respects—says the *Planter's Monthly (Hawaii)*—like human beings. They live, eat, drink, get diseased and die. If trees could talk, they would probably say: "Save us or we perish; give us something to eat, we have too much to drink; remove the weeds that are growing all around us; and poison the gophers that are devouring us." Every year that you take a crop from your trees give them something for it. Don't ask them to give off their substance without an adequate return. Fertilize every year by using a good article of commercial or other fertilizer. If we want our orchards to live to a good old age, we must take care of them. If trees need fumigating, have it done; don't say you cannot afford it. As a matter of fact you cannot afford to neglect it. A well-cared for orchard of fruit or coffee trees will produce good crops for several generations.

INDIAN TEA ASSOCIATION.

Abstract of proceedings of a meeting of the general Committee held on 14th March, 1898. There were present:—Messrs. G. G. Anderson, Chairman; A. F. Bruce, M. R. Quin, T. Traill and W. Warrington.

In his letter of 18th February, the London Secretary drew attention to a press telegram which stated that the "Planters' Association of Southern India have addressed a strong protest to the Government concerning exchange, and demanding the re-opening of the mints, urging that increased trade would outweigh the Government loss," and he asked for the views of the Association on the subject. After discussion, the Secretary was instructed to inform Mr. Tye that the general Committee entirely agreed with the arguments put forth by the Southern Indian Planters' Association, and they would be prepared to take the matter up.

Letters of 28th January, and 4th, 11th and 18th February, from the Secretary, London Committee, in connection with the American Market Fund, with their various enclosures, came up for reference and record. The Committee read Mr. Blechynden's report with much satisfaction, and the Secretary was instructed to reprint and circulate copies to all members. In his letter of 14th February, the London Secretary stated that, after due consideration of Mr. Blechynden's advice, the London Committee, were of opinion that the Association should continue its work in America for another year.

The general Committee expressed their concurrence with this view, and instructed the Secretary to ask for contributions from members for 1898, on the previous basis.—*Indian Planters' Gazette*, April 9.

COCONUT PLANTING IN MARITIME N.-W. PROVINCE.

Marawila, April 21.

The date of the burst of the monsoon is a vexed subject of annual recurrence. Each station has a different date for the occurrence. We have every indication of the S.W. monsoon, in breezes from the sea, its roar, which is heard for a good distance inland and heavy rain-clouds rising from the sea in the mornings. Occasionally, too, we hear the low rumblings of thunder from the South-West.

The period of drought we passed through was an exceptionally mild one. We had no rain for exactly one month, but coconut trees did not show the slightest signs of distress. The fact is, our district is flat and low-lying and the level of the water did not recede beyond the reach of the roots of the coconut tree.

An exuberance of pasturage is not a characteristic of districts abounding in sandy soil. Cattle feed mainly on the roots of grasses and their food supply was by no means lessened by the drought and their condition was all that could be desired. Sheep, and well-nourished cattle everywhere was the rule and not the exception.

Those who practise the mulching of the soil round coconut trees after digging in manure and promoting a loose, porous tilth round them, must find great encouragement from the article, which appears in the last number of the "Agricultural Magazine," on Fruit Culture.

The usual way of applying manure is in shallow trenches round the tree and covering them up. I usually dig the manure in round the tree as this tends to mix the manure with the soil and

also prevents the caking of the soil. To further keep free and porous the soil, urmel up, I mulch round the tree with coconut branches cut up and weeds when available. This helps trees to pass unscathed during a period of drought. The turning up of the soil round trees in annually widening circles is especially useful on hard, heavy soils. From an æsthetic point of view, an estate quite clean and trim and without a branch to be seen on the ground is very nice and gives its superintendent quite a reputation as a good planter. I prefer to subordinate æsthetics to utility. Study the habits of the coconut tree with some care. You will find that in shedding its fronds, the butt-ends are generally farthest away from the trunk. A neglected tree will in time have quite a litter or muck of fronds. Nature thus provides for the requirements of the tree. Man must follow the teachings of nature.

MACHINE-MADE TEA IN CHINA.

The *North China Daily News* says that very great interest will be taken in the most prospectus of the Lianz Hu Tea Improvement Company. The leaf grown in China is still the best in the world, all the plants that produce decent tea in India and Ceylon having been introduced there from China; the trouble is in the mode of preparation. Three or four men have been working for some years to get the Chinese to adopt the modern system of manufacturing tea. The manufacture has been adopted successfully on a small scale at Foochow, and experiment made at Wenchow last year with very inferior leaf opened the eyes of the Chinese as to how by the use of machinery they may regain the market they have lost. Now the tea-men of Hankow and high officials of the great black tea producing provinces, Hupoh and Hunan, have been interested in the matter, seeing that a recovery of the English market means wealth to themselves, as well as to the growers and the foreign merchants who handle the picked product. A company, modest enough in its inception, has been formed at Hankow with a capital of £15,000 and Shanghai is appealed to for its co-operation. It cannot be doubted that in this small beginning we have the germ of a revolution in the preparation of tea in China, and a resurrection of the trade between Hankow and London, which is dead if not actually buried.

COCONUT PLANTING IN THE STRAITS: NEWS OF MR. DONALD MACKAY.—The following interesting extract from the letter of Mr. Mackay to a friend has been placed at our service:—

My departure has to be again postponed, and I don't think it is any use my thinking of leaving Perak before the 7th prox. for Ceylon. I have good hope I shall be able to leave Penang on that date. The *Observer*, I see, has written an article on the fall in coconuts, his text being Horrekelle results for 1897. You cannot from one estate reason out for all, and I much doubt if the reasoning is applicable in Ceylon: I know it is not in the Straits, for the price of coconuts was never so high nor the demand so great for both the inland and export trade:—

Penang export price for nuts \$28½ per 1,000;

Local sales, home consumption \$30 per 1,000;

Seed nuts, selected \$40 per 1,000;

and difficult to get at that. There is a great rush into coconut planting no one is putting in any more Liberian. We shall have about 30,000 coconuts in the ground by the end of this year. We have begun ploughing.—Messrs. Davies & Co.'s plough not strong enough. Have written to Mr. Lewis Brown for one of the Horrekelly Swedish ploughs."

With such prices as Mr. Mackay names, it may pay some day to ship coconuts from Colombo to Penang?

MANURING AND ECONOMIC PRODUCTION.

We would draw attention to another interesting contribution from Mr. Baur on the above subject. It has been hitherto assumed that weeds were chiefly harmful because they take nourishment out of the soil; but the reason given by our correspondent is, at least, worthy of attention, if indeed, it be not admitted to be the correct one. The weeds being chiefly surface feeders, they dry up the surface soil, which is also the scene of activity of the micro-organisms. Mr. Baur's advice as to the necessity of loosening the soil is not a novel one, but now that the reason has been scientifically explained, and the advantages to be gained made clear, the matter should receive increased attention from planters. They all know the case of the Superintendent who cut manure holes, and after waiting in vain for the manure, covered them in again with the best possible results to his coffee,—for a time. The explanation is found in the increased activity of the micro-organisms and of the consequent increased formation of nitrates in a soil that had been worked. Further interesting information is that which refers to the transpiration of plants and how by a proper system of manuring the same can be diminished, so as to retain the water in the soil for use during the dry months. Those who suffer from drought and small flushes have here a remedy indicated. Altogether the letter before us is exceptionally suggestive and should be carefully perused and as much as possible acted upon, by planters.

NUTMEG CULTIVATION.

The nutmeg cultivation is one of the profitable cultivations as a staple product. The cultivation is simple in all its branches, and does not take long for a novice to learn the planting, caring, and preparing the produce for market.

There are many parts of the island in which the nutmeg may be grown to advantage. It will not pay if planted in shallow soil or on stone ranges, and from lack of moisture, the plains on the south side of the island would be unsuitable. But on the north-east from St. Mary to Morant Bay, in any well sheltered spot, well drained, with deep soil the nutmeg should thrive well. The climate should also be mild and seasonable with frequent showers. The trees should be planted twenty to twenty-five feet apart each way, according to the nature of the soil. They are generally planted three in one hole triangularly, two to two feet six inches either way. They are planted so as to ensure a female tree to each hole (but sometimes two or three declared females or bearing trees) and in that case you can transplant to a vacant spot, and destroy the males or non-bearing trees. But in all cases it is requisite to leave the males to each acre of cultivation. In destroying and transplanting never leave more than one tree to each hole. The young trees should be transplanted when about one year old.

Nutmeg trees commence to declare from three years upwards, according to the nature of the soil and situation, (but they have been known to take twelve years to declare). In one case the trees were exposed, and in another case the soil being too fertile the fruit went into leaves and sap. A tree taking a long time to declare can always with safety be counted to be a bearing tree. After they have commenced bearing, and the limbs droop with the weight of the pods and exclude all light, they should be then carefully propped up so as to admit light. If kept too dark you will lose a lot of your nuts from premature opening of the pods. In establishing a nutmeg plantation it is always best to have cocoa planted between, besides the intermediate crops of

vegetables, such as coco, cassava, bananas; but coco is considered the best, cassava comes next, but they must not remain in the earth longer than one year. As soon as the nutmegs commence to get covered in and require room for the expanding of their branches, you commence to destroy the cocoa trees, just taking off a limb or two as required to make room. It is generally better to pick the nuts during wet weather, in young cultivations, as the rain spoils the mace. In dry weather you need only to gather the nuts as they drop from the trees. After the nuts are gathered, the mace is then taken off, pressed into shape placed in the sun to be dried, though neither nutmegs nor mace should be submitted to very much sun in curing. In wet weather when you cannot depend on the sun, you must place the mace on wire netting, and put it in a place where there is a free current of air, to prevent the mace from mildewing. A good bearing tree is averaged to yield £5 per annum. The expenses on same or less than on any other cultivation of staple products when properly managed. I have supervised a nutmeg plantation in the island of St. Vincent where there are only ten acres in bearing nutmegs, five acres of which have just declared within the last year. But it is to be remembered that a nutmeg tree is never considered in full bearing until it is twenty years of age, and it continues bearing for very many years. This plantation yields £100 sterling per annum. The expenses, including boxes for shipping, etc., amounts to £50 per annum. The prices of nutmegs vary a good deal, for the best and largest nuts from 2s to 3s 6d per lb. The intermediate sized and long sized nuts are sold in proportion to the large ones, varying from 10d to 2s per lb, worm eaten and rotten nuts are also shipped, these vary from 4½d to 8d per lb. Mace also varies a good deal, from 1s 6d to 2s 6d per lb. I think that any one having land in a sea-sonable locality, would do well in establishing a nutmeg plantation here. D. W. MINORS.

—*Journal of the Jamaica Agricultural Society.*

MARKET FOR MINOR PRODUCTS.

London, April 2.

COCA LEAVES.—Bold green and sound Ceylon leaves sold at 7d per lb. and dull and damaged at 4d. Good green Truxillo leaves were bought in at 8d a bid of 7d being declined.

CROTON-SEED.—Dearer. Good seed, rather irregular in colour, sold at 6s. per cwt.

OIL, CINNAMON.—Five parcels were put up, but did not sell. For genuine bark oil 1s 3d per oz. was bid and refused; 3½d is asked for leafy. The exports from Ceylon from January 1 to March 1 were 16,312 oz. to the United Kingdom and 1,763 to Africa.

OIL LEMONGRASS.—No business done publicly today but sales have been made done at 5d per oz for genuine.—*Chemist and Druggist.*

CEYLON TEA IN AUSTRALIA:
A SYDNEY MERCHANT'S VIEWS.

Amongst the visitors to Ceylon recently was Mr. Pitt Brown who has been in business in Sydney as a tea merchant for a period of about eighteen years and was on his way to England, this being his first visit to the old country since he left for the Southern Colonies. He arrived here (where he has a nephew in Mr. Stephen Brown of Messrs. Geo. Stewart & Co.) in the end of March by the "Victoria" and resumed his voyage last week by the "Australia." During his stay here he has visited upcountry planting districts, making Hatton and Nuwara Eliya his centres, and he hopes on his return from England to be able to see something of planting in the low-country. At Hatton he met such well-known planters as Messrs. H. Blacklaw, of Strathdon, Mr. Hamlin, of Darawella, and Mr. Keith Rollo, of Wanarajah, and at the Sanitarium

he went over Scrubs. He next visited Kandy where he made a stay of a few days and no doubt met a number of planters. His trip was one of pleasure, but in Ceylon he had been happily able to unite business with enjoyment; and he was present at one of the tea sales, which was considered to be one of the biggest on record, and purchased some of the Scrubs' broken pekoe. The tea of this estate, he said, could be easily recognised by a boy, who has been only a few months in the tea room, on account of its peculiar earthy flavour, but the strange thing was that he could not discover this flavour on the estate, the explanation probably being that the tea he there saw was fresh off the fire. His impression of the tea market here was that at present the prices were ridiculously high, the Russians having forced up the better grades of whole leaf teas. The market here he considered was just like the wool market in Australia, where they were now selling much wool that used to go to London. The local markets were becoming much larger because, when they found it worth their while, the continental and American buyers went there as they were now doing pretty largely. Ceylon tea, in his opinion, bade fair to be the only tea sought for in Australia. Indian tea had never taken the hold that it did in London and really what we had to do was to oust China tea from the Colonies. What struck one here was what was going to become of all the tea that he saw, for miles and miles around him, for although extensions had been stopped there was new tea coming into bearing. Our tea trade with Australia would, he was sure, develop. The only hope remaining for China was to supply the common ration low-priced tea, for Ceylon tea could never be brewed as it was in a galvanized iron bucket over a fire. What the Australians liked was a well fermented tea. When he went to the colonies in 1880 it was nothing but Foochow tea that was in demand; but now that had "taken a back seat" and Ceylons were coming to the front even as compared with Indians. The Ceylon tea was much more suitable for drinking alone and there was a growing taste for it. The amount of choice tea wanted in Australia was really very small, the people there having been so long used to the low-priced China tea. On bulked tea imported into Queensland there was a duty of 6l and on package teas of 8d. All teas imported into Queensland were packed there because of course it was cheaper. When the duty was taken off at Sydney he was one of a deputation of two who waited upon the Treasurer and pointed out to him that it was not the wish of the trade that the duty should be taken off. The Treasurer's idea was that when he took the duty off the people would be able to pay better prices for tea and get a better article. Mr. Brown replied in the negative and he instanced what had taken place in the Channel Islands which was the jumping ground for all the rubbish which could not be sold anywhere else. He was of opinion however that the duty would have to go on again. At the Melbourne Exhibition he met the late Mr. A. M. Ferguson and he has pleasant recollections of his meetings with him.

COFFEE ENTERPRISE IN MEXICO.

However, I was fortunate enough to find Mr. Thos. Christy at leisure this afternoon and willing to give me his views about several matters. In regard to the Coffee Enterprise in Mexico,

his report is decidedly unfavourable. One of his sons has just returned from Tapachula, so that the facts he reports are brought up to the most recent date. Mr. Christy, junior, with his brother, who is in Mexico at present, have been located on the neighbourhood of Tacha, the volcanic mountain, and suffered much from fever. Most European residents are leaving the country, Mr. Christy tells me, because it does not answer in any way for them to remain. Though very fine coffee can most undoubtedly be grown, and is grown in Mexico, and prices are good, still the growers find the expenses of production are not covered. The absence of money is great also. So much is this the case that the Japanese Society formed near Tapachula, have been obliged to send their first batch of labourers back to Japan, and are at this moment uncertain whether to continue their present estates, not to speak of opening any new ones. Those estate agents from Mexico, who have been in Europe, visiting different capitals, endeavouring to finance their schemes on the strength of the buildings, fittings, area under cultivation and labour engaged have received no encouragement from German banks, who will have nothing to do with Mexican estates. In Austria, where the true state of matters was not at first known these agents met with more consideration; but after enquiries made at Berlin and elsewhere, the Austrian banks also showed the cold shoulder. In London the only approach to business is that advances are offered on the whole yield, but there is no inclination to buy estates outright.

This, it will be seen is a very different account from that in the prospectus of the Tapia Estate, and

INTENDING COLONISTS FROM CEYLON

would do well to pause and consider ere they proceed further as far as Mexico is concerned. There have been recently some meetings held in London, among those interested to see if nothing can be done to foist from the market the many made up concoctions of so called coffee (French coffee in tins, preparation of Cuban coffee, etc.) and to substitute in their place the pure article freshly roasted daily, but unground. It is felt that once the public had the opportunity of getting the whole coffee pure, these compounds which very often are not coffee at all would soon lose their hold of the consumer. The price at which coffee is now sold is 28s a cwt. which comes out about 3d a pound with 1½d allowed for duty per pound, and 1d for roasting—making the article 5½d a pound at first cost. That this coffee could be retailed at 7d or 8d a pound is already a well acknowledged fact inasmuch as 4,000 lb. weight of it is daily sold in Boston in America at that price, whereas the French and other preparations cost the consumer about 1s a pound.

The merchants who have the matter at heart therefore recently submitted to the Society of Public Analysts who in association with the Chemists and Druggists Company have a department in the Chamber of Commerce, several very pertinent questions on the point. Suppose, said they, a poor farmer who either from his poverty or other causes feeds his cows so ill that the animals give a weak standard of milk, would he not be fined for sending this inferior article of food to market? This the Society at once admitted. And suppose, continued the querists, this bad-milk was found to be used in

Restaurants and Hotels would not the penalty be binding equally in such a case? Then what is the position in regard to coffee? When people ask for coffee, what sort of a mixture do they generally get in answer to their demand? And ought not the vendor to be liable in this case quite as much as the farmer who sells bad milk?

The analogy was obvious, but the Society hedged in an ingenious manner. Government they replied, had given them no instructions on the point, and they had no rule to guide them. Individually they admitted the justice of the question and the difficulty experienced in getting pure coffee, but as a body they were unable to take any steps.

The brokers and merchants however went further. In order to prove that the thing could be done, and that a really splendid beverage could be sold at the price mentioned, they offered to supply several of the large establishments in London with

COFFEE FREE OF CHARGE

If sold as genuine, but their proposal met with but a cool reception. It was too much trouble for the Conservative retailer to be bothered with. A written application was also made to the Army and Navy Stores Company, this establishment being supposed to be one which only looked for a reasonable profit on the goods it supplied, to see if they would be willing to put 28s to 30s pure Brazilian first quality coffee before their customers at 7d to 8d a pound freshly roasted whole beans, the fact to be notified to the London press, so that the public might be made aware of the fact. However, the secretary after consulting with his staff wrote that the Company could not sell coffee at these low prices, and there as I understand the matter stands at present. There is no question that the brokers have got the right end of the stick, but whether they will be able to make progress with it remains to be seen. To get people educated up to buying a pure article at 7d

INSTEAD OF A MADE-UP CONCOCTION

at 1s seems at first sight the simplest thing in the world, but he was so thick, little knows the Great British public. Once the man in the street has got a notion he will stick to it through thick and thin, and it will be a clever person who can get it out for him again.

PLANTING NOTES.

COCONUT OIL.—Messrs. Lever Brothers (Limited), of Port Sunlight, have a large oil-mill near Sydney, N.S.W., where they press coconut oil from copra imported from the South Sea Islands. The oil-cake residue is entirely consumed in the colony.—*Chemist and Druggist*, April 2.

LIQUID FUEL is being introduced largely in England for locomotive engines on the Great Eastern Railway. Thirty-seven engines on that railway are burning oil fuel. The form of the engines is not different but the tenders carry two long cylinders of oil on the top of each side of the tender.—*Indian Witness*.

THE RUBBER ESTATES of Para, Limited, has a capital of £350,000, half in 7 per cent. cumulative and half in ordinary shares of £1 each. The company is formed to purchase and work Para Rubber Estates in the municipal district of Anajas, State of Para, Brazil. The purchase price is £300,000, leaving only £50,000 as working capital,

THE SOWRASHTRA OR SILK-WEAVING COMMUNITY of MADURA intended holding a Conference at that city during the first week of April. Among the subjects for discussion was a scheme for a textile school in which weaving and dyeing can be learnt, for, which the leaders of the movement have sought the help of Mr. John Wallace, C.E.

THE NUWARA ELIYA TEA ESTATES COMPANY'S Report reaches us at too late an hour to do more than call attention to the splendid array of figures afforded for yield per acre, average price and profit per acre of the different estates. The average yield is 518 lb. per acre; the average net price 9-28d., and the average profit per bearing acre £3 10s 11d. The Company have now 2,632 acres in tea out of a total of 3,047.

COCOA.—The allotments and most of the regrets in Tibbles Vi Cocoa were posted on April 3rd. This expedition has been attained by a large staff working in shifts, and by the adoption of an elaborate system on the part of Messrs. Williamson, Murray, and Co., who made the allotment. To all ledger customers, who applied for more than 10 shares, an allotment has been given on a liberal scale, and the bulk of the shares were absorbed by them and traders. Only a small balance remains for the general public.—*Globe*, April 4.

PLANTAIN CULTURE IN CEYLON.—A native correspondent writes urging that the larger cultivation of plantains by villagers might well be encouraged by Government, for the reason that there is a big demand for this fruit, and many a man could make a profitable living, who, for the present, resorts very frequently to crime to eke out a living. He makes a rather good suggestion, which is that a Government botanist from Peradeniya gardens might be asked to make a scientific investigation into the system largely followed in the N.-W. Province, of planting up the land between young coconuts with plantain trees. If it can be carried on without impoverishing the soil, he thinks the method should be extended.—*Local "Times."*

FIJI: A NEW CUSTOMS TARIFF.—The "Fiji Colonist and Levuka Gazette," of March 19th announces the introduction of a new Tariff by Governor O'Brien, the main features of which are:—

The increased Revenue to be derived will be exacted mostly from the natives, the Indian Coolies, the Polynestians, the Rotumans, and all the other coloured races who have elected to make Fiji their home, while the European settler is affected only in one or two particulars, tinned meats and biscuits for instance, but it is the Fijian and Coolie who will practically have to pay the piper. The second scheme which suggests itself is, that these import duties constitute as nearly as possible a thorough-paced Protective Tariff. Sugar £4 13s 4d per ton, tea 6d per lb, meats 1d per lb, rice £2 per ton and flour of all sorts £1, while in many minor details the local producer of marketable commodities will find his wares more valuable.

We add a few more items:—

Coffee, chicory, cocoa and chocolate per lb. or reputed package of that weight, and so in proportion for any such reputed weight 3d.

Spirits, of all kinds imported into the Colony, the strength of which can be ascertained by Sykes' hydrometer, and is under proof, per liquid gallon 14s.

Tobacco, manufactured, per lb. 3s.

Tobacco, unmanufactured,

THE YATIYANTOTA CEYLON TEA COMPANY, LIMITED.

Directors:—A. Thomson, Esq., Chairman; Charles Young, Esq.; W. J. Smith, Esq. Managing Agents:—Messrs. Whittall & Co., Colombo. Secretary and Offices:—T. A. Williams, 27, Mincing Lane, London, E.C.

REPORT OF THE DIRECTORS

to be submitted at the First Annual Ordinary General Meeting of Shareholders, to be held at the London Commercial Sale Rooms, 30 to 34, Mincing Lane, London, E.C., on Thursday, the 14th April, 1898, at 11 o'clock a.m.

The directors beg to submit the balance sheet and profit and loss account for the year ending 31st December 1897.

The net amount at credit of profit and loss account is. £3,999 5 10 of which the following sums have been observed in paying absorbed at 6 per cent. annum on the preference Shares—

On 1st July 1897 ..	£900 0 0	
On 1st January 1898 .	1,087 14 10	
		1,987 14 10

Leaving now to be dealt with a balance of £2,011 11 0

This the directors propose to appropriate as follows:—

1. In payment of a dividend of 2 per cent (free of Income Tax) on the £90,000 Ordinary Capital ..	£1,800 0 0	
2. In writing off the small balance of Preliminary Expenses ..	71 7 3	
3. In carrying forward to 1898 the balance of ..	140 3 9	
		£2,011 11 0

The crops secured amounted to 1,014,291 lb., being the yield for the full year from Polatagama, New Polatagama, We-Oya, and Walpola; and for nine months only, from the Rondura Group. The plucking area on all the estates was 2,032 acres, but the yield from 478 acres was very small, as the fields to this extent were quite young, and only just coming into bearing.

The quantity of tea sold in the Colombo market was 666,571 lb., and the balance of 347,720 lb. was sold in London.

The cost f.o.b. (or delivered to buyers in Colombo) was 3'91 pence per lb., and the average not realised price of the whole was 4'98 pence per lb.

The result for the year is disappointing, and much below the expectations formed at the time the arrangements were made for placing the Company on a sterling footing. To the lower range of prices which has of late ruled in the Tea market, and to the higher level of exchange between London and Ceylon, this result is mainly due, while last year the cost of production was enhanced in some measure, by the exceptional item of Loss on the Rice supplied to the Coolies, and by abnormal weather which lessened the yield. The average price obtained for the Crop the Directors do not consider satisfactory, but with the ample facilities for manufacture now at the disposal of the respective Managers of the Estates, they look for an improvement in quality which, apart from market considerations, should result in a higher average being secured in future.

A sum of £700 obtained as premium on the second issue of preference shares has been placed against the preliminary expenses of the Company, the balance of which (£71 7s 3d), as will be seen above, it is proposed to charge against the profits of last year, thus closing this account.

Up to 31st December last a sum of £10,317 12s 7d was expended on the development of the properties which amount is made up as follows:—

On planting and upkeep of area not in bearing ..	£6,693 4 2
On purchase of 34 acres land added to the estates ..	152 12 11
On additions to Buildings and Machinery ..	3,471 15 6

£10,317 12 7

In accordance with the terms upon which the properties were, respectively, taken over, the above figures include all expenditure, less crop receipts, from 1st January to 31st March, 1897, in connection with the working of the Rondura group; as also the outlay subsequent to 14th August 1896 (as per Prospectus), on development of the other Estates.

The following are details of the acreage of the Estates as at 31st December, 1897:—

Acreage under Tea.

Estate.	Bearing.	Partial Bearing.	Not Bearing.	Being Cleared.	Total Cultivated	Forest Reserves, &c.	Total Acreage.
Polatagama	665	—	72	50	787	255	1,042
We-Oya	381	16	90	—	487	136	623
New Polatagama	235	—	5	—	240	209	449
Walpola	401	192	228	50	871	133	1,004
Rondura	350	—	169	80	599	631	1,238
Totals	2,032	208	564	180	2,984	1,364	4,348

As mentioned in their circular of 13th February, 1898, the Directors anticipate that the further issue of 800 Preference Shares, therein referred to, will provide all the funds necessary to bring the above cultivated area into full bearing.

The Directors are pleased to be able to report that the latest advices from the Managing Agents are of a satisfactory character, and justify the expectation of steadily increasing crops at lower cost of production as compared with that of last year. The yield for the current year is likely to show an increase of 20 to 25 per cent on that of last year, while three to four years hence, when all the young fields will be of a full yielding age, a very satisfactory return on the capital of the Company may reasonably be looked for, even under the present existing conditions of market and exchange.

Messrs. Cape & Dalglissh, C.A., offered themselves for re-election as Auditors of the Company.—By order of the Board,

T. A. WILLIAMS, Secretary.
27, Mincing Lane, London, E.C., 6th April, 1898.

NUWARA ELIYA TEA ESTATES COMPANY, LIMITED.
SECOND ANNUAL REPORT.

(Annual meeting fixed for April 20 in London.)

The directors beg to submit to the shareholders the balance sheet and profit and loss account for the year ending 31st December, 1897.

The surplus shown is £13,584 18s 10d from which falls to be deducted Debenture Interest, amounting to £1,800, leaving a balance of £11,784 18s 10d. An Interim Dividend free of Income tax, was paid in October, 1897, of £1,761, being at the rate of 6 per cent per annum, and it is now proposed to pay a final Dividend, free of Income tax, at the same rate, making 6 per cent for the year, which will absorb a

further sum of £6,000, and be apportioned as follows:—
 Shares Nos. 1—15,870, from 1st Jan. to 31st Dec. 1897, at 6 per cent per annum £9,522 0 0
 Less In'm Div'd 4,761 0 0
 £4,761 0 0
 „ 15,871—20,000, from 1st July to 31st December, 1897, at 6 per cent per annum 1,239 0 0
 £6,000 0 0

Of the balance £1,023 18s 10d, it is proposed to add £300 to the Sinking Fund against the premium of £2,162 15s 2d paid for Leases, bringing the total up to £6'0; to write off £481 1s 3d, the balance of the formation expenses of the Company, thus closing this account; and to carry forward £242 17s 7d.

The crop of Tea from the Company's Estates amounted to 964,963 lbs. of which all but 23,254 lb. were made at the Company's own factories.

Of other products, 505 bushels of Coffee and 27,338 lb. of Cinchona Bark, were gathered and sold in Colombo.

The cost of production of the Tea crop and placing on Steamer at Colombo was 5-58d. per lb.

The rate of Exchange for the year averaged 1/3 15-32, and the nett price realized for the Tea crop was 9-215d. as against 9-30d. in 1896, a decline which is almost nominal in face of the serious drop in the average price of Ceylon Teas during the year.

The following table shows the result of the year's working of each Estate, excluding Hethersett and Denmark Hill, two gardens in the immediate neighbourhood of the other properties of the Company, and which were only acquired as from 1st July, 1897:—

E state.	Acreage in bearing in 1897.		Tea Crop. lb.	Average yield per bearing-acre.	Nett price realized per lb tea.	Profit per bearing-acre.	
	Full.	Partial.				£	s. d.
Park	161	7	91,285	543	10-06	10	7
Kenmare	113	7	58,781	490	9-70	8	7
Portswood	260	—	148,561	571	7-58	4	19
Naseby	125	27	86,544	565	9-95	10	1
Pedro	213	—	181,809	619	8-89	10	18
Lovers' Leap	132	44	71,411	406	8-89	5	15
Concordia	80	102	83,000	456	10-06	10	4
Hillside	137	—	79,762	582	9-90	11	15
Court Lodge	302	24	148,070	454	9-25	7	8
	1,523	211	899,223	518	9-28	8	10

The directors are sanguine that those estates which this year have not given a due proportion of profit per acre will in the future shew better results.

The weather during the season was exceptionally favourable for growth of leaf, and the tea crop considerably exceeded the estimate.

On the other hand the rate of Exchange continued adverse throughout the season, to the extent of about 1/4d per lb. of tea as compared with the average of 1896, while the loss on rice owing to the famine in India, amounted to a further 1/4d per lb. of tea. These causes have materially affected the result of the season's working. It is not, however, expected that this year there will be any deficit in the rice account.

A new issue of shares, amounting to £41,300, was made as from 1st July last, £17,300 of which was subscribed for at £2 per share premium, the balance being issued the vendor in payment of the purchase price of Hethersett estate.

The present acreage of the Company's estates is constituted as follows:—

	Acres	Acres
Tea in full bearing	1,819	
Do do leased lands	90	
Tea, in partial bearing	393	
Tea, not yet in bearing	330	
Total land under cultivation with Tea		2,632
Jungle, Patna and Scrub, and Fuel Trees, &c.	415	
Total acreage	3,047	

During the year Mr. Alexander Thomson accepted a seat on the Board as an additional Director, and Mr. Wharram Megginson has also been elected in place of Mr. C. R. Robson, who resigned his seat in September last.

The Directors retiring are Mr. C. A. W. Cameron and Mr. H. St. J. Oscar Thompson, who being eligible offer themselves for re-election.
 London, 31st March, 1898.

THE STANDARD TEA COMPANY OF CEYLON LIMITED.

Directors:—Alex. Brooke, 25, Fenchurch Street, London (Chairman); Robt. Kay-Shuttleworth, Slough Place, Cuckfield, Sussex; Norman W. Grieve, Harbury, Forest Row, Sussex; William Rollo, 5, Stanley Gardens, Kensington Park, W.

Secretary:—A. Trafford Brooke.

Agents in Ceylon:—George Steuart & Co., Colombo. Offices:—25, Fenchurch Street, London, E.C.

SEVENTH REPORT OF THE DIRECTORS TO THE SHAREHOLDERS.

To be submitted at the general meeting, to be held on Thursday, 21st April, 1898, at noon, at the offices of the Company.

The Directors submit Statement of Accounts to 31st December, 1897.

The Profit and Loss Account shows a profit on the working of the Estates in Ceylon of £12,332 18s 0d., which with amount brought forward from last year, less interest and home charges, shows a sum of £11,720 12s 3d available for division.

In July, 1897, the Directors, under the powers entrusted to them, distributed an interim Dividend for the six months ending 30th June, 1897, of five per cent. (10 per cent. per annum), absorbing £2,975.

They now recommend a Dividend at the rate of ten per cent. (making fifteen per cent for the year) absorbing £5,950; the placing £1,000 against depreciation; £1,000 to reserve; and the carrying forward to the next year £795 12s 3d.

Coffee has contributed to the results to the extent of about 440 cwt. of £1,900, less expenses of cultivation and marketing.

The average Exchange for the Company as drawers in Colombo was 1/3 15-32 against 1/2 19-32 in 1896, and 1/1 1/4 in 1895. The difference in 1897 compared with 1896, unfavourably affected the accounts to the extent of about £1,200. The Loss on Rice, that is the difference between the price at which it is supplied to the Estate Coolies and the price paid for it, is equivalent to something not far off 1 cent per lb. on the season's output of Tea. The Tea from the Company's Uda Pussellawa properties sold during 1897 in Mincing Lane averaged a higher price than any Ceylon Estate or group of Estates producing above 100,000 lb. Still, Tea prices have been lower this last season than previously, those for the Uda Pussellawa Estates 1 1/4d per lb. nett lower, and for the Maskeliya 3d per lb. lower, and it is only the young land coming into bearing that gives opportunity to the Company to keep up the dividend.

Coneygar, the purchase of which was announced in the last report, is receiving careful attention, and the Directors are satisfied that this will eventually prove a good investment.

The Company's Properties at the close of 1897, were 3,465 acres, with 1,680 acres of Tea considered in full bearing, viz.:—

in Uda-Pussellawa—				
St. Leonards	} 901 acres.	399 acres tea bearing		
Coneygar				
Liddesdale		814 do	140 do	
Eskdale		240 do	208 do	
Gordon		386 do	154 do	
Tulloes	419 do	165 do		
in Up. Maskeliya—				
Gouravilla and Up. Cruden	} 705 do	614 do		

There are also 507 acres tea in partial bearing, and some 295 acres in addition planted with tea. On St. Leonards, Liddesdale and Gordon Estates there is

still some coffee interspersed through the tea. Mr. Norman W. Grieve, the Director, who retires by rotation, being eligible, offers himself for re-election.

PEPPER: GOVERNMENT ESTATES IN KUALA KANGSAR, STRAITS SETTLEMENTS.

On the Chigar Galah pepper estate permanent new coolie lines and a go-down have been built and a tank for making white pepper. About half the estate was manured with guano, with excellent result. The bulk of the *lallang* is now got rid off, and the whole estate is fairly clean. The crop was sent direct to London, where it fetched top market price: viz., 6 $\frac{3}{4}$ d. per pound for white and 3 $\frac{1}{4}$ d. per pound for black pepper. The revenue derived by sale of pepper, fruit and young trees was \$2,848.82, and the expenditure \$2,833.45. This includes \$600 stolen, and \$225 given to Syed Mnsa (not a fair charge on the estate) while the expenditure on buildings will not recur.

Citily has been on our hands, and visited regularly until handed over to Sir Graeme Elphinstone at the end of the year for \$25 per annum. He has since sub-let it for \$250 per annum, and he still keeps the Government pepper gardens.

The Kuala Kangsar gardens have been enlarged by a field of six acres planted with nutmegs, and six more acres under coconuts and other fruits. All the old trees have been thoroughly manured, and the grounds kept up. Fruit and seedlings were sold to the value of \$1,665.50, and cattle to the value of \$281.63. Total revenue \$1,957.15.

The herd of cattle have been improved by the introduction of new blood.

A nursery of Trang pepper has been planted up with cuttings direct from Trang, and looks very well. Many thousand Para gutta seeds and seedlings have been sold. All the Para gutta trees have been trapped, with good results, and samples sent to London are valued at 6s. 9d. to 3s. per pound. We did not sell any gutta in 1897, so have a lot still in store. The expenditure amounted to \$3,449.72. -Report for 1897 by Mr. H. Berkeley.

THE TICK PLAGUE AMONGST HORSES.

The most stringent regulations are in force in Madras regarding the quarantine of all shipments of horses from Australia, and particularly from Queensland, owing to the fear of bovine tick fever being introduced. The following is the text of a letter from the Government of India to the Madras Government upon the subject: The fact that, during the last shipping season, a shipment of horses was landed at Madras, and a part of them railed to Bombay, which had been brought direct from a tract in Queensland, where the tick plague is so prevalent that the Colonial authorities do not allow stock from within it to cross its borders, has directed the attention of the Government of India to the possibility of the new and virulent disease being introduced at any moment into India from abroad. Early measures will be taken to obtain the necessary legislative authority to prohibit or control the importation of live-stock from infected areas. But in the mean while, it is very desirable that all shipment of Australian horses landed at ports in the Madras Presidency should be carefully watched with a view to minimising the danger of the pest being introduced into this country. Having regard to the terribly fatal nature of the disease, and the doubts as to its existence in India and as the immunity of Indian cattle, the Govern-

ment of Madras are assured of the cordial co-operation of the Governor in Council, in adopting such precautionary measures as may be possible, pending the grant of fuller powers by the Legislature.—Asian.

THE ALLIANCE TEA COMPANY.

Yesterday morning I was at the annual meeting of the Alliance Tea Company of Ceylon. The accommodation of 9, Fenchurch Avenue, is not so extensive as for instance at Winchester House, or Cannon Street Hotel, and the reduction of the dividend had the effect of bringing together sufficient shareholders to fully occupy the sitting accommodation provided. I noticed Mr. Bowden Smith, Mr. W. Mackenzie, Mr. E. M. Rossiter and others. Mr. John Bell-Irving occupied the chair, supported on either side by Mr. E. J. Young and Mr. R. S. Corbett. Mr. Bell-Irving was quickly on his feet and said:—The Directors regret the poor result of the season's operations, but this arises from circumstances beyond their control, and is not in any way caused by a falling-off either in the crops or the quality of the tea produced on the various estates. In most instances there has been an increase in the production, but, whilst the estates producing high-grown teas such as Thornfield, Gleneagles, Uda Radella, and Calsay, have shewn very profitable results, Aberdeen and Luccombe have practically only paid their way, owing to the high exchange and the poor prices ruling last season for the class of teas produced by these properties. The estimates for the present year to which reference is made in the report, lead us to hope for good profits from all the estates, particularly as every effort is being made to keep down expenses, to increase the output, and to improve the quality of the tea. Even if exchange remains at its present high level, and only the average prices of last season are realised, there should be a distinct improvement in the year's profit. You are aware of the issue of Debentures we have recently made. A reference to the balance sheet will show you that whilst we have a total capital in shares, premium and debentures of £105,838, the Capital Expenditure amounts to £112,000, and Advances to Coolies £3,280, and it was essential, therefore, that additional funds should be raised to cover this excess. The funds thus provided, however, are sufficient for our requirements, and we shall not I hope, have occasion to raise further money for some time to come. I should mention, however, that the estimates for the present year provide for a further Capital Expenditure of about £1,500, and that we have had to arrange for a new factory for Uda Radella. These Capital outlays are serious items, but they are necessary for the proper upkeep of the Company's properties, and for the increasing crops of tea, and the expenditure will, I think, prove to be justified by results. I might add that on last year's working there was a loss on rice supplied to coolies of £612, which represents almost as 1 per cent. dividend on the share capital of the Company. We have again been at a disadvantage this last year in consequence of the high rate of exchange that has ruled throughout the year. As shewn in the Balance Sheet the average rate has been nearly 1d per rupee above 1896, and 1d in exchange makes a difference to us of 2 per cent on the share capital of the Company. In our report we give you particulars of the total acreage of tea in bearing, but these figures are slightly misleading, and we should have shewn separate columns of the tea in full bearing, in partial bearing, not in bearing, and tea clearings. These figures are as follows:—

	Acres.
Total tea in full bearing	.. 2,563
" " in partial bearing	.. 105
" " not in bearing	.. 61
" " clearings	.. 75

Without these details before you, some explanation would be required of the item under capital expenditure of tea clearings, £612 10s 2d, this expense

being in respect to the field outlay on the acreage not in bearing. He concluded his speech as usual with the remark that he would be glad to hear any remarks any shareholder might wish to make.

Mr. W. MACKENZIE rose and disclaiming any wish to cavil at the accounts or the year's results, asked, in connection with the purchase of Dunkeld estate, what the borrowing powers of the directors were. He was informed they were up to half the purchase price of the properties. He then remarked that he thought that the acquisition of estates in Ceylon should be submitted to the shareholders and receive their approval. That he thought £50 per acre for a property yielding 400 lb. per acre was high, and he would be glad to know if the board contemplated any further purchase. The Chairman informed him that the board had no further purchase in view, and that the intended acquisition of Dunkeld was mentioned in last year's report. Mr. Mackenzie's remarks met with some approval amongst those in the room, and he sat down expressing himself perfectly satisfied with the replies he had received.

Mr. E. M. ROSSITER, whom I was glad to see looking so fit and well, then made some remarks upon Coast Advances. The amount, £3,250 17s. 1d., showing under this head in the balance-sheet, was a heavy one. As an old Ceylon coffee planter he had been accustomed in his day to 10s per head. He did not know what labour force the Company employed, but he thought that this amount at 5 per cent. would yield something towards a dividend. [Mr. Rossiter had evidently not studied the Ceylon papers in these latter days, or he would know that things have changed a great deal since his day.]

The CHAIRMAN suitably replied, and then Mr. CORBETT rose to second the adoption of the report and accounts. But Mr. RICHARD WADE JENKINS, a shareholder, said he was anxious to make a few remarks upon an addition to the board. On enquiry he was informed that the articles provided there should be not less than three nor more than five members of the board. He said he thought it would be to the advantage of the Company if a thoroughly practical man were added to the board, and he wished to propose that Mr. F. H. WIGGIN be elected. He thought this a most advisable measure, for, as an instance, however much knowledge Mr. Corbett might possess of Ceylon, he was not well acquainted with estate management. He suggested moreover that this addition to the board be made without increasing Directors' fees which he considered liberal. This class of reduction of expenses immediately results are not so satisfactory is well-known, and more than one shareholder expressed his disapproval of the suggestion. The articles, however, provide that the Chairman takes £150 per annum, and the other Directors each £100 per annum, surely moderate enough remuneration for a Company of the size and standing of the "Alliance." It was suggested to Mr. Jenkins that it was usual in a matter of this sort that notice should be given to enable all the shareholders to have a voice. But Mr. Jenkins persisted, and asked for the articles to be referred to. It was eventually decided that Mr. Jenkins should give the necessary notice. Mr. Rossiter seconded Mr. Jenkins' motion during the discussion.

The CHAIRMAN closed the proceedings by saying it was no pleasant to come down from 10 to 6 per cent, but he hoped for better things next year.—Cor. of the local "Times" April 26.

TRAVANCORE TEA ESTATES COMPANY, LIMITED.

The first ordinary general meeting of the shareholders of this company was held at the offices of the company, 20, Eastcheap, E.C., on Monday. The chair was occupied by Mr. W. Mackenzie, chairman of the board of directors.

The CHAIRMAN:—I presume you will take the report and accounts as read. The copy of accounts sent to all of you has told you that the directors have called this meeting in order to submit the general

balance-sheet and profit and loss account to end of September, 1897. Various reasons, the chief being difficulties in obtaining transfers of properties purchased since the company was formed, account for the delay in calling you together. You are aware that this company was formed essentially as a development company—to open up extensive areas of land in Travancore, and plant them with tea. The table embodied in the report shows you, that of a total of 6,490 acres which we own, only 975 acres are in bearing, while 1,022 acres were planted in 1896 and 1897, and we are endeavouring to plant 1,300 acres this year. If we succeeded in getting this work done we shall have 3,297 acres of tea with almost as much more land for future extensions. Being a development company the ordinary shareholders are in the position of men who have joined together to buy and open land as tea planters, and of course, must expect to wait some time for their profits. The directors, however, could have paid a very fair dividend on the ordinary shares had they not been advised that the profits earned before registration, £1,150, were not available for dividend purposes. On £20,500 the amount paid up during the six months to end of September, £1,150 would pay 10 per cent. You will observe also that £121 has been carried forward, so that we begin the New Year with £1575 on hand, of which £1,150 has been placed to reserve. Another point you will observe is that, although only at end of our first year, there is nothing due for preliminary expenses, every penny being charged up and paid. In this you will see the conservative policy of the great company under whose auspices we were launched. We are further indebted to the directors of that company, who are also directors of this company, in that they have waived all claims to directors' fees for this first year. I may mention that although subsequent purchases have given us 975 acres in bearing our plucking area, last year, for which you have the report, was only 644 acres. About our future prospects I shall be in a better position to speak when I return from a visit I am to make immediately to our properties, but it is our hope and aim to bring into bearing and fully equip the 3,300 acres which we expect to have planted this year at a cost of somewhat less than £30 an acre, and have the remaining 3,000 acres for nothing. The estates Tangakul, Granby, Telkadi, Inji Cadu, and Blocks 13 and 14, aggregating 2,293 acres, have been purchased since the prospectus was issued. I now move the adoption of the report and accounts.

The resolution was seconded by Mr. David Reid and carried unanimously.

On the motion of Mr. Haslam, seconded by Mr. R. B. Reid, Messrs. Harper Brothers, chartered accountants, were appointed auditors.

The proceedings closed with a vote of thanks to the chairman, proposed by Mr. Pettit and seconded by Mr. Haslam.—*H. and C. Mail*, April 8.

A SHARP CRITICISM.—"The Rubber Estates of Para," Limited, is one of those companies which wise investors should (says the *Daily Mail*) leave alone. The capital is big, and there is no independent evidence as to the value of the property to be acquired. It is all a question of estimate. The profit is estimated, the production is estimated, the revenue is estimated, and the extent of the estate itself is estimated. As the purchase price is to be £300,000, and as the estates are out in Brazil, something more than mere estimate is wanted to permit of an investor risking his capital. The course taken at the end of the prospectus in quoting an opinion from the *Daily Mail* on the rubber trade as being in favour of this particular company is not, we hope, likely to mislead many people; but, in case it should, we hasten to announce that we regard the "Rubber Estates of Para," as a highly speculative and most unpromising undertaking.

Correspondence.

To the Editor.

PLANTING IN MYSORE AND THE NORTH
MYSORE PLANTERS' ASSOCIATION.

Koppa, Mysore, Mareh 19.

DEAR SIR,—I enclose copy of proceedings of the annual general meeting of the North Mysore Planters' Association, of which I have had the honor of being elected President. Some of my old friends during my stay in Ceylon, from 1875 to 1883, in Ambagamuwa, Nitre Cave, and for the last five years at Wattedelle, Madukelle, may be glad to hear of me, though a good many have gone. I see many still mentioned in the weekly *Observer*, which I have taken and read regularly since I left Ceylon.

We are not having a very rosy time of it with coffee just now, owing to very late rains, chiefly in May; during the past two years crops have been very poor, and, with the aid of that arch-fiend leaf-disease, coffee is having a hard fight of it. We are now looking anxiously for rain, and if we get an early and good dose of it, crops should be good all round as places are in capital heart and having had practically nothing taken out of them for two years should make us the *amende honorable* this year. Exchange is, of course, hitting us very hard and with the price of coffee fallen from 15 to 20 per cent. Prospects for the coming year are a trifle depressing, but we must hope for the best.—I am, dear sir, yours very truly,
E. C. BOLTON.

THE RECENT IMPORTATION OF
TROUT OVA.

Ceylon Fishing Club, Nuwara Eliya, Mareh 22.

SIR,—It may interest those of your readers who are members of the Fishing Club to know that the last lot of trout ova, imported by the ss. "Gera," have proved a great success. We have already hatched about 11,500 out of 20,000 eggs, and we shall probably get about 1,500 more. The alevins are strong and healthy, and we ought to get from 9,000 to 10,000 fry from them, which will be a most seasonable addition to our streams. This shipment proves that if only the eggs are properly and carefully treated on board ship, the hatchery here (under the very capable management of Mr. Elhart) can deal with them very efficiently. Messrs. Wiekwar and Farr, who are both going home, have kindly promised to do their best to make such arrangements as to packing and shipping as will secure a few more successes like the present.—I am, sir, your obedient servant,
S. M. BURROWS,
Hon. Secretary.

TEA FACTORIES AND SITES.

25th Mareh.

SIR,—In reply to "An Indian Tea Planter" whose letter appears in your issue of the 23rd inst., I would advise him, either to become a "Ceylon creeper" for a short time, or to pay for professional advice. As a practical planter of over 30 years experience, I shall be glad to visit his estate, and give him the best advice as to factory site, etc., for a moderate remuneration.

I will add a word of warning "free, gratis, for nothing." *Don't rush in for expensive buildings and "up to date machinery" till you find your yield of tea per acre will afford the expense.*
—Yours faithfully,

A CEYLON PLANTER.

DEHORNING CATTLE.

DEAR SIR,—Can you or any of your readers tell whether the practice of dehorning cattle has ever been resorted to in Ceylon with the object of improving their condition. This is what the "Queenslander" writes on the subject:—"The manager of a large herd of cattle in the north, who secured one of the dehorning implements imported some two years ago, reports that he has used it very freely in his herd, and with the very best results. He states that dehorning has the effect of quietening the cattle, and his experience is that dehorned cattle fatten more rapidly than horned cattle. In the Western and North-western districts, where cattle are trucked to the coast, dehorning will be found of very great advantage; but when cattle-owners have made up their minds to adopt the practice, the operation will be much more effectively and less painfully performed on calves, either by means of the knife, or by caustic potash." Dehorning has also been used with good effects for years on some of the cattle runs in the Hunter River district.—Yours truly,
INTERESTED.

[We have never heard of "Dehorning" cattle in Ceylon: only of the horns of buffaloes being blunted in some districts.—ED. T.A.]

No. II.

DEAR SIR,—Dehorning cattle in India and Ceylon is practised much and is a common thing, you will be surprised to learn. Dehorned cattle, it is quite true, fatten very *quickly* and on *ordinary food*. The practice has been introduced many years ago into Ceylon principally by the cattle-dealers from India. Dehorning is also resorted to, to show that cattle are younger than they really are! Sheep, goats and other cattle are dehorned, without giving any pain to the animals operated upon merely by gently applying for two or three days heat to the horns, which are previously covered with human hair or thin fibre to secure from excess of fire. The old horns come off very easily, while the root of the young horn (reddish in appearance) remains and by the time the horns have grown, the animal becomes fit for table and is in prime condition, generally. I should much like to know, through the columns of your valuable paper, "the how, the why and the wherefore" from some scientific and qualified authority. The Patriarch of Dimbula,—the late Mr. Wm. Smith—knew all about this I think. Can our amiable "Vet," Mr. Sturgess not enlighten us on the point. Many would "like to know, you know." The blunting of the horns of ferocious buffaloes by Sinhalese is also, as you say, in vogue, particularly throughout the Kandyan country, but that does not fatten them. It is only for protection from being gored by them while working the animals.
MUDALIYAR,

No. III.

DEAR SIR,—There may be said to be three degrees of dehorning or dishorning: (1) cutting off the external horns by means of the saw or shears; (2) removing the shell of the horn and leaving the core described by your correspondent "Mudaliyar," and (3) totally doing away with the horn, root and all. The third method is of course the most effectual and has resulted in

the production of hornless or polled breeds. It is generally performed when the animals are very young before the development of the external horns, the rudiments of which are quickly and with very little pain removed with a sharp knife. Another way of destroying the horn is by making cross incisions into the corny tissue where the horns afterwards appear and inserting a small piece of caustic potash which has the effect of destroying the root of the horn. Where cattle are kept in enclosed yards, or large numbers are herded together, the operation of dehorning has the result of quieting the animals and so indirectly causing them to improve as fat stock or milch cows. There was some time ago a dead set against dehorning as a cruel practice; but the operation is now looked upon as more humane than otherwise where goring and worrying may be expected to take place among crowded confined herds.—Yours truly,
X.

STOCK AND USEFUL HINTS.

Rosewood, Nuwara Eliya, April 16.

DEAR MR. EDITOR,—I enclose a slip taken from a newspaper, it might be useful to some people. I shall thank you to publish the same in your local paper.—Yours faithfully,
E. J. T.

DEHORND CATTLE.

Nowadays most of us accept the belief that cattle ought not to have horns. It is best to breed them off. There are as good animals of the beef breeds that are polled, as those that have horns. It is quite time that horns should be bred off all the milk breeds. If this has not been done, the next best thing is to prevent the horn starting to grow on the calf. The operation does not take five minutes. Use common concentrated lye, such as women use for softening water and making soap. While the calf is less than ten days old is the proper time. Simply wet the bump where you expect the horn, and rub on as much powdered lye as will equal three grains of maize Do not wet elsewhere. Let the calf alone hereafter. The scabs will come off, and the hair grow out as nicely as on a natural poll.

SHELTER BENEFICIAL TO STOCK.

Calves will not thrive if they are gradually being transformed into roast veal under the burning rays of the sun. There is no species of farm live stock that pays better for being made comfortable, and the absence of protection from the summer heat is felt equally as much by the animals as by man. Every paddock should have its place of refuge, either a thick clump of trees or a shed open on all sides, placed on the highest point in the paddock, to allow the breeze to sweep through it. Protection in summer is almost as necessary as in winter, and is a duty that might be urged upon the sense of right of the stock-owner. Those amenable to appeals of this kind will need no urging to provide this needed protection.

THE CUCKOO (SINHALESE "COVAH.")

SIR,—The advent of the cuckoo (Sinhalese "Covah" in the Western Province of Ceylon, is an annual occurrence. It generally takes place by the middle of April or the beginning of May; but this year they have come in unusually soon. Early in the morning of the 14th inst., the hills around Maligakande echoed with the welcome "Coo-hoo" "Coo-hoo," which told us unmistakably that the cuckoo had arrived, much to the discomfort of our wily friend, the crow! It is said that the cuckoo has no architectural proclivities, it does not care to build, but is content with what the crow does in that direction—it stealthily gets into the crow's nest, lays its eggs and departs; leaving the hatching of her eggs, the care and feeding of her offspring to *pater* and *mater* crow,

Very often the deception is detected and the interlopers are ejected, to this is attributed the sparse numbers in the cuckoo tribe. We have two varieties of the cuckoo in Ceylon. The black and the spotted (the kalu and pulley covahs of the Sinhalese). Fine specimens of both are to be seen in Mr. Sannmg-m's beautiful aviary at Devon House. C.

ARTIFICIAL MANURES (BONES) IN AGRICULTURE: USEFUL INFORMATION.

Colombo, April 2nd.

DEAR SIR,—With reference to your article on the value of bones in agriculture, the following table, showing the results of some experiments carried on at home, may prove of interest:

Out of 100 parts of phosphoric acid there was removed by the first year's crop:

Superphosphate	63.
Bone-meal	7.

Out of 100 parts of phosphoric acid left by the first crop, there was removed by the three succeeding crops:

Superphosphate	30.
Bone meal	13.

The phosphoric acid in raw bones is now generally recognized to have the same manurial value as that of insoluble mineral phosphates. If bones exercise a better influence, as they undoubtedly do, it is due to the nitrogen they contain, and to nothing else. Out here bones ought to have a slightly superior value as our climate has a decided influence on the decomposition of organic matter, of which bones are largely composed, but this more favourable action is to a great extent counteracted by the coarser state in which bones are used.—I am, dear sir, yours faithfully,
A. BAUR,

The Ceylon Manure Works.

MANURING OF TEA vs. CHEAP PRODUCTION.

DEAR SIR,—The difficulties besetting the Planting Industry have received such prominence of late, that it may not be out of place to examine whether there are not means to extricate the same from the present unsatisfactory position. Such a resource—lying within practical reach of every planter—I hold a proper system of Manuring to be.

Before referring to the practical side of the question, it may be well to note how this subject of manuring is thought about at home and out here. There, manuring has been generally adopted, because it has been recognised to be the only means of making cultivation pay, whilst in Ceylon manuring is looked upon rather as a luxury, which is resorted to only reluctantly and by few. What then, it may be asked, is the difference between manuring at home and manuring out here? The conclusion is simple. In Europe manuring is and can be carried on economically owing to the progress of and aid given by agricultural chemistry, whilst in Ceylon manuring has always proved expensive, owing to want of guidance and of knowledge as to its proper principles.

If manuring in Ceylon has not proved the success it ought to be, considering its exceptionally favourable climatic conditions, and if, in consequence, it has not been more generally resorted to, it is simply because the system of manuring is bad. It is not the planter, who is responsible for this. He cannot look after his business and be an agricultural chemist besides. But, as in other countries whose welfare is largely dependent upon agriculture, it should have been the duty of Government to keep a staff of agricultural chemists entrusted with the solution of matters of practical interest to the planter. Instead of that, agriculturists have been left to their own resources, and it is not surprising therefore that Ceylon should not have benefited by the progress made in agricultural

chemistry during the past 20 years. The planter has recognized the necessity of returning to the soil certain plantfood ingredients removed by crop; but with regard to the most important and most costly of them, he has not been made aware that it is largely supplied by natural sources. The consequence is that thousands and thousands of tons of nitrogenous manures are still yearly being put into the soil, for which there is but little necessity. And what consideration has been given to the other necessary manurial constituents? Very little and that little (except by a few) has been given without proper discrimination. It is well-known that, for its successful growth, the plant is just as much dependent upon one as upon the other plantfood constituent. It cannot live on the ready nitrogen first and on phosphoric acid (the yet undissolved bones) later on. Yet the most soluble nitrogenous manures are being applied along with the most slowly acting phosphoric manures. No wonder therefore that plants never do get the full benefit of those large applications of nitrogen, and that manuring should prove a costly operation. To recognize the necessity of applying phosphoric acid and yet to apply it only in a slowly available form, as in raw bones, means nothing else than to make the plants' growth dependent on the latter. It is therefore indispensable that phosphoric acid and potash should be applied liberally and only in a form readily available for the plants in order to enable the latter to make full use of the natural sources of nitrogen or of any nitrogen applied artificially.

In my second circular explaining the principle of the fertilizers recommended by Mr. John Hughes, for Ceylon Tea, I touched upon the natural sources of nitrogen and considering the importance of the matter I may be permitted to refer to the subject again. By last mail I received a Report published under the auspices of the French Minister of Agriculture, in which the fixation of atmospheric nitrogen has been most amply demonstrated. I have already pointed out that certain conditions are necessary to induce nitrification (the formation of nitrates by micro-organisms), of which warmth, moisture, and the presence of oxygen may be stated as the most important. In Europe nitrification is intercepted during the cold season, a good deal of the nitrates that are formed during summer and more particularly during autumn, get lost during winter through drainage and percolation, and in spring the soil is not only particularly deficient in nitrates; but owing to the lethargic state of the micro-organisms the formation of nitrates is going on at its slowest just when the growing vegetation stands most in need of it. That is why it has been found necessary to assist the growing vegetation by an artificial supply of nitrates, in the form of nitrate of soda. It had, however, been discovered that if some soil is taken from the field in autumn and during winter maintained in a warm room, where, it is kept moist by the addition of water and occasionally stirred up, the formation of nitrates went on uninterruptedly. Some French agricultural chemists decided to give this lesson a practical application. For this purpose a certain number of experimental plots were set aside and planted. One series was manured with cattle dung and in addition with 2 cwt. of nitrate of soda (containing 15 per cent of nitrogen) per acre. The other series received an equal quantity of cattle dung and in addition 2 cwt. of nitrifying earth per acre. This nitrifying earth, as explained above, was nothing else than natural soil taken from a field in autumn, and maintained during winter in a state favorable for nitrification by being kept in a warm room, where it was occasionally stirred up and kept moist by the addition of water. These experiments were first undertaken in 1896, repeated in 1897, conducted independently at different places and with different crops. During their growth the plants which were thus differently manured, showed no difference in appearance, and when the produce was taken from the fields it was found that in most instances a better crop was obtained from the plots which had received this nitrifying earth than from those which had received the

nitrate of soda. To still further demonstrate the influence which this nitrifying earth had on vegetation, two plots were set aside and planted. One received an application of 2 cwt. of nitrate of soda and the other of 2 cwt. of nitrifying earth without any other manure being added, nor had the two plots been manured the previous year. The results again justified expectations, for the crop from the field which had received the two cwt. of nitrifying earth exceeded by about 10 per cent the crop from the field which had received the two cwt. of nitrate of soda (which latter was equal to an application of five cwt. of best white castor cakes per acre). This favorable action of the nitrifying earth is not to be attributed to the insignificant quantity of nitrates introduced into the soil, but to the intervention of the micro-organisms, which, being maintained in full activity during winter, continued their work of fixing the nitrogen from the atmosphere and of rendering it available for the plants. If, however, they can succeed at home in doing away with the necessity of applying special nitrogenous manures why should not the same be possible out here where there is no winter to intercept nitrification? With such a damp climate, even temperature, and well-distributed rainfall, it may be taken that the most favourable conditions for nitrification are fulfilled by nature; and those who in spite of this continue to apply large quantities of nitrogenous manures do so uselessly and entirely against their interests in a monetary sense. Therefore let those who want good crops and who desire to make their cultivation pay go in for manuring liberally with phosphoric acid and potash, which ingredients are almost always deficient in soils and they will reap the benefit of the natural sources of nitrogen. Instead of saying I cannot afford to manure, they will, by adopting the right principle, find that, as at home, it will pay them handsomely to do so. It is not the cost, but an injudicious selection of manures, which makes manuring an expensive item.

In his climate the Ceylon Planter has a most powerfully, and if he will only take advantage of it, he will be able to hold his own; and it will not be for him, but for his competitors in the North of India, in China, and Japan, to fear the effect of low prices—I am, dear sir, yours faithfully,

A. BAUR,

The Ceylon Manure Works.

Colombo, April 4th, 1898.

No. II.

SIR,—In my last letter I drew attention to the natural sources of nitrogen, which under our climatic conditions render the application of large quantities of nitrogenous manures unnecessary. I have pointed out that we owe these natural sources of nitrogen to micro-organisms living in the soil which fix the nitrogen of the atmosphere and convert into nitrates the organic nitrogen already present in the soil. The conditions favourable for nitrification are equally favorable for the fixation of the atmospheric nitrogen and consist in warmth, moisture, &c. When these conditions are fulfilled the micro-organisms acquire an extraordinary activity and it has been found that even without the aid of nitrogenous manures, the nitrates thus formed are usually in excess of the requirements of the most exacting crop. Unfortunately these nitrates are not capable of being fixed in the soil and cannot be stored up for future use as is the case with phosphoric acid or potash. Any excess or any nitrates that are not taken up by the plants immediately are carried off and get lost through drainage and percolation. Thus when the conditions for the existence of these micro-organisms cease to be favourable, the formation of nitrates diminishes in proportion, a scarcity of nitrogenous food

is brought about and very soon we find that the growth of the plant is arrested. This is exactly what happens here in dry weather. We are apt to attribute the want of growth to want of water for the plants. But we forget that if it was actual want of water for the plants, the leaves of the latter would fade and drop off. The true explanation is this. We know that plants act like pumping machines. By their transpiration they throw back into the atmosphere the water that has fallen to the ground; they cause the soil to dry up, and with the drying up the conditions favorable to the performance of the functions of these micro-organisms disappear. At this stage even the largest provision of nitrogen fails to do any appreciative good, since the micro-organisms are unable to perform their function of converting the nitrogen into nitrates, the form in which nitrogen is taken up by plants. Therefore, before these large and expensive applications of nitrogenous manures are resorted to, which we have seen may be superfluous at one time and useless at another, would it not be well first to attend to the conditions required by these micro-organisms? This can be done by increasing the absorbing and retentive powers of the soil for water. The planter has already recognised this necessity by keeping the soil free from weeds, those powerful evaporators of water. He ought now to go a step further (which some have already done,) and loosen the soil, either by turning, forking or cutting holes and filling them in again, in order to increase the capacity of the soil for holding water and to facilitate the circulation of air containing the oxygen, which is another condition necessary to sustain the functions of these micro-organisms. A soil thus worked has been found to generate as much as three times the amount of nitrates produced by a soil left itself.

But there are yet other means at the disposal of planters to preserve moisture in the soil. I have said already that plants may be looked upon as powerful pumping machines. It has been found that plant leaves often transpire in the space of one hour as much as their own weight in water and that generally they transpire from 233 to 912 lb. of water for every pound of plant tissue formed. What this means everybody can find out by multiplying this amount by the weight of leaves removed by crop. This transpiration has been found to be regulated by the amount of plant-food in the soil. Thus whereas a plant with a sufficient amount of nourishment in the soil transpires 250 lb. of water for every 1 lb. of plant tissue formed, the same plant transpires 800 lb. of water when left to grow in poor soil. It is clear therefore what an advantage it is to keep the plants liberally supplied with properly constituted fertilizers in order to prevent excessive transpiration and thus to keep the moisture in the soil where it is needed during the dry months.

The sooner the planter realizes the fact that nitrogen is not the food for plants but nitrates, the formation of which is dependent upon the function and activity of micro-organisms and that he will have to look to the conditions of life for the latter in order to get the benefit of the former,—the sooner will he arrive at a due appreciation of what constitutes soil fertility and the better will he be able to make his cultivation pay.—I am, dear sir, yours faithfully,

A. BAUR,

The Ceylon Manuring Works.

April 23, 1898.

CAMPHOR CULTIVATION IN CEYLON

Government Botanic Gardens, Hakgala,

Nuwara Eliya, 6th April, 1898.

DEAR SIR,—Referring to your question as to what is being done with camphor cultivation in Ceylon, I may add the following to what I wrote you on the 11th of February last. Wishing to satisfy myself that solid camphor existed in the leaves and twigs, of even very young plants, I sent a small bundle of prunings, from plants planted out at the end of 1895, to Mr. S. A. Owen of Messrs. W. Jordan & Co. of Lindula, who had very kindly undertaken to make the experiment for me. I am pleased to state that he has been very successful in extracting solid camphor from them; and as this of general interest to planters, I shall be much obliged if you will be good enough to publish Mr. Owen's letter in an early issue of your paper.

The prunings from an average plant 28 months old as grown here, weigh from 10 to 12 lb.

I have a good many plants that want pruning, and if applied to before the end of this month, April, I shall be very glad to supply 10 or 20, or 35 lb. prunings to any person wishing to make the experiment for himself.—I am, dear sir, yours faithfully,

W. NOCK,
Superintendent, Government Botanic Gardens,
Hakgala.

The following is Mr. Owen's letter, Talawakele, March 30th, 1898.

Dear Mr. Nock,—Thanks for the parcel of camphor prunings duly received. I have made several experiments. The following is the account of methods employed and results.

(1) Took about 7 lb. of mixture of leaves, twigs and small branches and gently simmered with about 2 gallons of water for 3 hours. Result: a strong smell of Camphor pervaded the bungalow and a small quantity of Camphor Oil collected on the surface of the water but no solid Camphor appeared.

(2) Selected the thickest of the branches (averaging about an inch in diameter) and cut these into small pieces about 4 lb. in all. These chips were put into an empty kerosine tin, and this tin was placed inverted over another kerosine tin partly filled with water and the joints between the two were luted around to make it steam-proof. The upper tin had a circular hole cut into the top part, and this hole was fitted with a cork and the cork was provided with a glass tube about 2 feet long communicating with a condenser. Heat was applied to the lower tin and soon after water began to boil, solid Camphor commenced to form in the tube and a little while after the latter became blocked. The steam now forced a passage through the various joints and so the remaining Camphor was carried into the air thus spoiling this trial.

(3) A gallon iron kettle was packed with leaves and small twigs together with about 2 pints of water. The cover of the kettle was luted on and the spout fitted with a cork, while a long glass tube proceeded from the cork to a condenser. A short time after the steam commenced to flow, solid Camphor began to form in the tube until the latter was at length blocked to a considerable distance; there was in consequence a loss of Camphor as in previous experiments, but not so much as the tube was cleared by the application of a spirit flame which caused the Camphor to melt and run down. As the result was so promising I determined to carry out the same experiment, with a definite quantity of material, as below.

(4) Packed the kettle with 1½ lb. of leaves and twigs as before with same amount of water and modified the arrangement so that no blocking could occur. Applied heat gradually and kept it up for five hours. At the end of this time the sides of the

condenser were coated with camphor, and small lumps were floating in the water which distilled over. All the camphor was collected carefully and dried between bibulous paper (to absorb most of the adhering oil). It then weighed 55 grains, which is equivalent to 12 ounces to the cwt. or 15 lb. to the ton.

I think the results very encouraging, as the leaves and young parts of the camphor tree contain but a very small proportion of camphor compared with the trunk-wood. Indeed I believe that in Formosa and other camphor-producing countries it is customary to altogether discard the branches and leaves and use the mainwood only.

I should think that planters who have young camphor trees coming on here in Ceylon, would find it well worth their while to utilise their prunings—especially if firewood is available and cheap, as this latter item would be practically the only expense, beyond the small amount of labour required and the initial expense of a still; which latter could be easily extemporised out of almost any kind of large iron vessel to which heat could be applied. As the camphor tree is a long while coming to maturity, considerations of this kind ought to be borne in mind.

I have pleasure in enclosing a small sample of the camphor obtained. As you will see it has a rather dirty appearance due to unavoidable impurity and the sample smells of camphor oil, but these are easily got rid of in the process of refinement. I also enclose a small sample of the same camphor partly purified by sublimation.

You are, of course, very welcome to make what use you like of this account of these small experiments, whether by publication or otherwise. No doubt it would be encouraging to those who have gone to the expense of planting up camphor trees to know that there is camphor in our locally grown trees. I have heard of one or two misgivings as to whether the soil and climate here would favour the formation of camphor in the tree.

The trees are cut out recklessly in Formosa and other countries, while the consumption of the article increases yearly. Enormous quantities being used in the manufacture of "celluloid" and other goods of this kind.—I am, yours faithfully, (signed)

S. A. OWEN.

THE POSITION OF TEA: THE NEED FOR NEW PRODUCTS.

SIR,—Now that many of us have conquered our characteristic false modesty and have openly expressed the opinion that tea cultivation is and for some time has been on many estates an unprofitable occupation, it seems not unnatural to enquire what we propose to substitute for it in the event, by no means improbable, of no relief being afforded to producers in the matter of exchange.

Already we hear the more enlightened of our coolies, anxiously enquiring what their future prospects are when tea is no longer cultivated, and though they look at the great silver question from a different standpoint, who can say that the problem is not already of sufficient importance to demand immediate and earnest enquiry? Although we may consider the Exchange Question as the rock which most seriously endangers the future of the Tea Industry, as well as all others, it is not the only danger to be faced. Leaving out of consideration the great risks of over-production with so much young tea soon coming into bearing and the failure to secure new markets, with the competition of scientific manufacture in China, Java and Japan, we have to reckon on the gradually lessened yield from our older tea fields which the spread of insect-pests is certain to bring about. Efforts have been made in despatches and in public

speeches to promulgate the idea that the industry is absolutely safe from any danger of this kind, but it is time that the bubble was pricked and the true state of affairs generally admitted.

What about the ravages of *Helopeltis* in the lower district, the frequent appearance of red spider in many others and the prevalence of scale insects in nearly all? Does the wholesale burning of tea-prunings on many estates on which firewood is by no means plentiful mean nothing? Is it not a fact that tea is *apparently* being killed out on some estates by a boring beetle closely allied to the species which has for some years been attacking the most weakly cacao trees in every district? We are reaping the benefits again, as with coffee, of our indiscriminate *mono-cultivation*, and the only remedy lies, as before, in the cultivation of *New Products* and their substitution for all inferior tea.

But what are we to grow? Shall we go on drifting as before until one or more of us hit upon some profitable substitute and then all follow like a flock of sheep?

Again and again you have urged the cultivation of Fibre-yielding Plants, but the only result has been the spasmodic planting of a few roots of rhea: the Ceylon planter is sitting on the fence waiting for his brothers in India and the Straits to show him that rhea fibre will pay! Our indigenous fibres have been wholly neglected and nothing has been done with *Sisal*, with *Phormium tenax* or other plants beyond experiments which have shown clearly that they can be grown as profitably in Ceylon as in any other country.

Other industries have been urged in your columns, one at least for the past fifteen years and latterly camphor, but this should have been taken up some years ago as it takes so long before it brings in any substantial return.

In the lower districts tea can be planted up with Para Rubber and Coconuts,—a good deal has already been done in this direction,—but at higher elevations, what are we to substitute where tea is likely to be no longer profitable?

We have become so imbued with the idea that any cultivated product in Ceylon must be a *permanent* one that it will be a difficult matter to hit upon any that will fulfil this requirement, and in this, paradoxical though it seems, lies our hope of salvation. We want an *annual* product, or, if possible, a variety of such, in order to avoid the evils attendant on *mono-cultivation*, and the Planters' Association might at this juncture invite Essays on the subject and so make an effort to save the Colony from a recurrence of the troubles which followed on the failure of coffee and cinchona. —Yours faithfully, SPERO MELIORA.

THE TEA PLANTING INDUSTRY:

REDUCTION OF EXPENDITURE:

LONDON AND COLOMBO CHARGES MUST COME DOWN.

London, April 8.

DEAR SIR,—Those in England interested in the Ceylon tea industry read with great interest the articles published in the Ceylon papers on the necessity for a reduction of working expenses to meet the altered conditions of the industry, and it is gratifying to see that Agents and others are equal to the occasion and have already taken steps for retrenchment.

But reductions, as in the coffee crisis in the early eighties, must be general and the difficulty be grappled with in Colombo and London as well as on the estates. That there is room for cutting down in "the Colombo and London charges" will be admitted from the following scale of charges elicited by a few planting shareholders at a meeting of the "Imperial Ceylon Tea Estates, Ltd." this week:

Receiving and shipping tea in Colombo 1 cent per lb. plus export duty, and cess, etc.	
Commission on disbursement 1 per cent.	
London Agents' commission 2	
When worked out these charges seem out of all proportion to the nett profits of 1897, thus:—	
Receiving and shippg. at lct. ex 1s 3 ^d —	roughly £365
Commission on disbursements at 1 %	" 141
Lon. Agents' com. on gross sales 2 %	" 485
General charges	" 70
Directors' fees	" 350

	£1,411
Nett profit for 1897	" 3,689

Directors of some Rupee Companies have waived their fees for the past year in view of the unfavourable results and this example might be followed by others to the extent of making a reduction in fees in proportion to the decrease in the profits.

Tea is shipped, as almost everyone knows, at half a cent a pound, and London charges for selling one per cent.

With tea prices lower than in 1897 and exchange steady at about 1s 4d, shareholders must bestir themselves and let their voices be heard at the general meetings and retrenchment in every possible form be insisted on.—Yours faithfully,

AN UNFORTUNATE SHAREHOLDER.

SILK CULTIVATION: A NEW INDUSTRY FOR CEYLON.

10th April.

DEAR SIR,—When I wrote you some fifteen months ago on this subject, I had had no opportunity of making trials with the castor-oil silkworms at any high elevations and merely expressed the opinion that its cultivation would pay well in all the lower districts. Since then trials have been made at 4,000 and 5,000 feet with satisfactory results. In each case, though handicapped by a short supply of leaf and by want of accommodation for large numbers, the worms have been reared without any casualties and have produced very good cocoons.

A brood takes longer, of course, in a cold climate than in the lowcountry where eight 'crops' are yielded in a year, but this would probably after a little while be compensated for by a finer yield of silk. The castor-oil plant grows luxuriantly at all elevations, but the leaves are smaller in a cold district.

Trials have also been made at the elevations above mentioned with the Japanese and the Bengal mulberry-feeding silkworms with results which show that their cultivation will pay better than tea has done for a long time past on many estates. The object in view hitherto has been to improve the *stamina* of each species by careful selection. As regards the cultivation of the mulberry-feeding worms, those who contemplate taking it up should begin by planting mulberry trees amongst their tea and in other suitable places, as the leaf is not fit for feeding silkworms until the trees are two or two and a half years old.

The Colombo School of Agriculture might be of use in starting the cultivation of the castor-oil silkworms in the lowcountry.—Yours faithfully, B.

STERLING TEA COMPANIES AND TEA PRICES.

Dimbula Estate, Kotagala, April 15.

DEAR SIR,—Will you allow me to point out that your "Editorial Note" headed "Sunnygama Tea Estates Company" is not perfectly correct. As you may see from Messrs. Wilson, Smithett & Co.'s Annual Circular for 1897, Queensberry estate sold in that year in London about 391,500lb. tea at an average of 8¹/₂d per lb. against an average of 8d per lb. in 1896 for a somewhat smaller quantity. In both years the whole produce of the estate was sold in London; the estate belongs to the Kotmale Valley Estates Co. of Ceylon (Ltd.), which has a sterling capital and its offices in London. This Company paid last month an interim dividend of 4 per cent on its ordinary stock, being at the same rate as for the corresponding period of last season. I quite agree with you that at present, Colombo prices for certain classes of tea are considerably above those ruling in London. The question is how long it will last?—Yours, etc

J. ROYDON HUGHES.

CANAIGRE—A TANNING PRODUCT—AND NOT IN MUCH REQUEST.

SIR,—Re your correspondent's remarks on Canaigre, this plant undoubtedly merits well-directed trials on upcountry estates, judging by the rate of yield I am told Mr. Nock has obtained at Hakgala gardens. Unfortunately, however, it is a tanning product, and other sources of tan not requiring cultivation are practically unlimited. Probably it is for this reason that, according to the *Australian Tropicalist*, Agricultural Departments have failed to force the Canaigre on the attention of Australian farmers, some of whom regard it as being no better than the common dock, which it closely resembles.—Yours,

ENQUIRER.

PLANTING NOTES.

TIMEHRI "THE JOURNAL OF THE ROYAL AGRICULTURAL AND COMMERCIAL SOCIETY OF BRITISH GUIANA."—Contents for December, 1897:—Papers—Some Neotropical Birds, by C. A. Lloyd; Abortive Publications, by the Editor; Agriculture in 1829, by William Hilhouse; Our Peasant Population—Their Past Condition and Future Prospects, by Seaforth M. Bellairs; The Boa Constrictors, by J. J. Quelch; B. Sc. Lond., C.M.Z.S., Among my Books, by J. G. Cruickshank; Occasional Note; Reports of Society's Meetings, from July to December, 1897.

ERGOT IS A DISEASE OF GRASSES, which is different from smut. It attacks the flower, and assumes the form of large grains, which are in this case also the resting stage of the disease, remaining quiescent through the winter months until the grasses, corn, &c., are flowering when spores are formed in the ergot to be carried by the wind to attack the flowers. Smut or ergot in corn and hemileia in coffee cannot be considered analogous.—Mr. Wm. Fawcett, B.Sc., F.L.S., Jamaica.

DEAFNESS. An essay describing a really genuine Cure for Deafness. Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce.)

Colombo, May, 3rd, 1898.

EXCHANGE ON LONDON:—Closing Rates *Bank Selling Rates*:—On demand 1/3 15-16; 4 months' sight 1/3 31-32; 6 months' sight 1/4

Bank Buying Rates:—Credits 3 months' sight 1/4 3-116 to 1/4; 6 months' sight 1/4 5-16 to 11-32. Docts 3 months sight 1/4 7-32 to 9-32; 6 months sight 1/4 11-32 to 1/3. Indian Bank Minimum Rates 11 % to 13 %. Local Rates 2 o/o to 3 o/o Higher.

COFFEE:—Parchment on the spot per bushel R13-50 Plantation Estate Coffee, f.o.b. on the spot per cwt. R78-00. Liberian parchment on the spot per bus. R4-50. Native Coffee f.o.b per cwt. R45-00 nominal

TEA:—Average Prices ruling during the week Broken Pekoe per lb. 43c. Pekoe per lb. 34c. Pekoe Sou-chong per lb. 28c. Broken mixed and Dust, per lb. 19c. Averages of Week's sale.

CINCHONA BARK:—Per unit of Sulphate of Quinine per lb 5c. 1 to 5 %

CARDAMOMS:—Per lb R2-37

COCONUT OIL:—Mill oil per cwt. no quotation. Dealers' oil per cwt. R13-37 Coconut oil in ordinary packages f.o.b. per ton R30C-00

COPRA:—Per candy of 560 lb. R45-00 nominal

COCONUT CAKE:—(Poonac) f.o.b. (Mill) per ton, R80-00 Coconut unpicked and undried, per cwt. R48-50

COIR YARN.—Nos. 1 to 8 { Kogalla R17.25
Colombo R16 00

CINNAMON:—Nos. 1 & 2 only f.o.b. 60c. Do Ordinary Assortment, per lb 53c. } out of season

EBONY.—Per ton

PLUMBAGO:—Large Lumps per ton, R440 Ordinary Lumps per ton, R410 Chips per ton, R270. Dust per ton, R180 } Tendency upwards

RICE.—Soolye per bushel, { R 3.40 to 3.75
per bag, { R8.75 to 9.77

Coast Calunda per bushel, R3.65 to R4.00 Muttusamba per bushel, R4.00 to R5.00

Kadappa and Kuruwe per bushel, R3-60 to 3-70 Rangoon Raw 3 bushel bag:—R9.50 to 9-75

Kara R3.25 to 3.35

FREIGHTS.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for May:—

Vol. IX.]

MAY, 1898.

[No. 11.

SEASON REPORTS FOR MARCH.

ESTERN Province.—Paddy. Preparations for Yala in progress. Fruits scarce, also vegetables except in the Colombo district. Rainfall very deficient, and interfered with preparations for paddy cultivation.

No. cattle disease.

Central Province.—Paddy. Maha harvest over in most places; outturn and prospects good. Rainfall deficient, 1.89 in. in Matale. No disease among cattle.

Northern Province.—Paddy. Kalapokam harvest in progress. Cattle plague in Putukudiyiruppu and a disease known as "Munanginoi" prevails among goats in the Mannar district. Little rain, .83 in. in Jaffna, .22 in. in Mannar.

Southern Province.—Paddy. Preparations for Yala crop in progress, but somewhat retarded by the drought. Health of cattle good. Rainfall at Galle .73 in.

Eastern Province.—Paddy. Preparations for Pinmari crop under tanks in progress, the Munnari crop is reported fair. Rainfall .75 in. in Batticaloa. No cattle disease reported.

North-Western Province.—Paddy. Maha harvest on; prospects generally good. Preparation for Yala commenced in some parts. Murrain prevails in the Kurunegala district (but is on the decrease), also in some villages of the Chilaw district. Rainfall in Puttalam on six days, and measured 3.45 in.

North-Central Province.—Paddy. Maha crop reaped and yield good. Rainfall at Anuradhapura, 1.17 in. Murrain prevails among cattle, but it is not widespread.

Province of Uva.—Paddy. Maha cultivation going on. Some early sown fields in Welassa are withering for want of rain. Fruits plentiful and cheap. Health of cattle good, except for a few cases of murrain in Dambagalla Korale.

Province of Sabaragamuwa.—Paddy. Maha crop being harvested in most parts, prospects good, outturn very good in the Kegalle district. Some foot and mouth disease in Beligal Korale.

AGRICULTURAL SHOWS.

Agricultural Shows are everywhere recognised as a powerful factor in the agricultural education of the people.

We have lately been perusing a communication made by a farmer to an English Exchange, in which the writer states the many ways in which he derived material benefit by attending a Show of the Royal Agricultural Society in the provinces. And if the English farmer with the ready means of communication available to him and the facilities he has for deriving information through the press and other ways, is prepared to confess that there is so much good in Agricultural Shows, it will be confessed that to the village cultivator of Ceylon, living in remote parts of the interior of the Island, with little opportunity of hearing or reading anything calculated to improve his agricultural knowledge, the benefits derivable from Shows must be incalculable. The educational influence of Shows is in many ways greater than that of the written words of a book or newspaper or the spoken words of a teacher or lecturer, since they provide object lessons which always leave a lasting impression on the mind. Again, these Shows are important mediums for the dissemination of knowledge, for visitors do not simply look at what is to be seen without getting all the information that is to be gained with regard to the means of producing the exhibits so strikingly set before them.

But for bringing about the best results there must be some system in holding Agricultural Shows. What we mean is that a programme of these Shows should be once and for all decided upon, and everybody should be well acquainted with the details, while, what is of most importance, the Shows should be held at regular intervals, and if possible at different centres. There will thus be healthy competition which is often made impossible by the fact that a Show is frequently sprung upon the agricultural community after many years. Various interesting facts are made known by Shows, such as the best season, elevation, &c., for producing the best results with different crops, the comparative merits of produce raised under different conditions, the period of growth of plants, the effect of manures—facts which are often lost sight of in ordinary cultivation.

It is a matter for congratulation that H.E. the Governor is in favour of Agricultural Shows being held in the colony, as is to be inferred from the fact that there is so much activity being displayed in this direction of late. We should expect that a marked influence and improvement for the better will before long be discernable in the quality and scope of agricultural practice among native cultivators,—a result greatly to be desired.

HOW TO TELL THE AGE OF NEAT CATTLE.

The age of an animal may be ascertained by the teeth until it reaches the age of six years, after which time the horns are the only guide. Cattle cast no teeth until they reach the age of two years, when they get two new teeth; at three years they get two more, and every succeeding year two, until five years old, when they are

termed "full-mouthed," although, strictly speaking, they are not "full-mouthed" until they reach the age of six years, because the two corner teeth are not matured until that period is reached.

The age may also be determined by the horns; but in some cases the most enlightened judge is deceived, as the horns may be scraped or filed in such a manner as to deceive any person.

At the age of two years the horns are without wrinkles; but at the age of three a wrinkle appears at the base, and every succeeding year another appears; so by adding two to the number of rings on the horns the age may be ascertained. "Poverty rings" are sometimes to be seen on the horns, which are brought about by starvation when rearing the animal, but are smaller than those brought about by age.

Mr. James Irving, M.R.C.V.S.L., gives the following as the test of age in dairy stock:—

Table of Early Average Improved Breeds.			Table of Late Average Improved Breeds.			Table of Late Average Unimproved Breeds.

—Queensland Agricultural Journal.

OCCASIONAL NOTES.

Dr. Somerville writing to us with reference to a subject that was lately discussed locally says: "I should not think it impossible that strong smelling manures might give a flavour to garden and farm produce, but only if used irrationally."

As the result of actual trial it was found, on using the lactometer for testing the products of the cream separator worked at the School of Agriculture, that while the specific gravity of the skim milk was 1.035, that of the cream was below the 1.000. This gives an indication of the utter unreliability of the instrument.

Messrs. R. de Silva, Lucas Mendis, and M. A. Fernando, who lately completed their course at the Forestry School, have been asked to be in readiness to take up appointments in the Forest Department. The new batch of Forestry students whose term commenced on May 1st, are all drafted from the Forest Department.

We understand that a number of Ceylonese young men will probably leave for New Guinea in June to work for a Syndicate formed with the object of developing the agricultural resources of that Colony, and that one of the old boys of the Colombo School of Agriculture will most likely go out with the party to open out land for coconut cultivation.

We have to thank the Hull Oil Manufacturing Company, Limited, for a sample of their Homco Castor Meal, and their offer to send a consignment of the fertilizer for experimental purposes.

The Andropogon family of grasses which is fairly well represented in Ceylon includes a number of species containing essential oils with characteristic odours. Of these, the best known are *A. nardus*, a cultivated variety, of which is the citronella grass grown in the Southern Province: *A. citratus*, the familiar lemon grass, also cultivated, though not so largely as citronella, in the South: *A. schoenanthus* var. *versicolor*, known variously as anise-scented, palmarosa, oil of ginger, and geranium grass. This grass is found in the north of the Island and is common on the Island of Delft. A good deal of oil (rusa oil) is extracted from it in India: *A. muricatus* is the cuscus grass, the scented roots of which are used for making fans and punkahs, and from which oil is to some extent extracted. Another well-known scented Andropogon of India is *A. luniger*, the Herba Schoemanthi and *Juncus odoratus* of the old pharmacists, commonly met with in N.W. India, where the oil is extracted.

The British and Colonial Druggist of March 4, states that the botanical origin of lemon grass oil is a matter of some doubt, and that it is probable that various species of andropogon are used in its preparation. It may be that commercial lemon grass oils adulterated with essential oil yielded by other andropogons, but the botanical origin of true lemon-grass oil is by no means a matter of doubt, and the grass, which is so common a flavouring agent in Eastern cookery, is too well known to be confused with any other species of the same family. We note that the demand for lemon-grass oil has been rising owing to the fact that ionone or artificial essence of violets is obtainable from citral, the odoriferous constituent of the grass. Ionone is also obtainable from essential oils containing geranium, while the rhizome of *Iris florentia* also produces a substance resembling the odour of violets.

Apropos of the odour of violets it may not be generally known that cattle overdosed with turpentine, secrete through the kidneys a volatile product which gives off a strong scent of violets. Finlay Dunin in his *Veterinary Medicines* thus refers to this fact under the head of "General Actions and Toxic Effects" of turpentine: "Swallowed, it is rapidly absorbed and diffused, and may speedily be detected in the chyle, breath and sweat, which have a strong terebinthinate flavour, and in the urine, to which it imparts the odour of violets." We have ourselves had opportunity of noting this symptom of overdosing with turpentine in a herd of calves, and been much struck by the peculiar phenomenon.

We reproduce elsewhere a *resumé* (taken from the *Australian Tropiculturist*) of the Countess of Warwick's scheme for an opening for women in the domain of agriculture. The scheme is a bold one, but as our contemporary observes, by no means beyond the range of possibility, and we are inclined to think that the details could be so modified as to suit the conditions of different countries and communities. With us, it must always be a reproach that poultry keeping is a neglected industry, at least as a true commercial undertaking and not merely as a pastime.

There is, of course, a good deal of technical knowledge that is necessary before a poultry farm can be started on proper lines, but that is no excuse why poultry keeping should be a neglected industry. Again, if there are difficulties in the way of butter making in the low country, cream and other milk products will command a ready sale; while pig rearing is always referred to as a remunerative undertaking, though "clean" pork can be got only with the greatest difficulty.

CITRONELLA OIL.

We have to thank Mr. F. H. M. Corbert, Executive officer and Home agent for Ceylon at the Imperial Institute, London, for copies of the *Imperial Institute Gazette* and the *Pharmaceutical Journal* containing reports on the examination of Citronella oil. It had been noticed by the trade that native distilled oils have a much inferior aroma to those distilled by two English firms, viz., Messrs. Fisher of Singapore, and Messrs. Winter & Sons of Baddegama in the Southern Province, Ceylon, and that these two classes of oils also show very marked difference in physical character. The impression in England is that there is no difference in the variety of grass from which the oil is obtained. The idea of sophistication is put aside, as the nature of the adulterant, if any, employed has never been determined. Messrs. J. C. Umney and Swinton, after making an examination of oils reported their views to the British Pharmaceutical Association, stating that the high optical activity of the native-distilled oils is undoubtedly due to the presence of a terpene which does not exist, or has been removed from, the oils distilled by English firms. The latter class of oils was found to consist principally of camphene. The experimenters conclude that the native-distilled oil is in no way sophisticated but is a genuine natural oil. The high specific gravity and rotatory power are due to the presence of constituents which also affect the solubility in alcohol, and, by acting as dilutents, impair the odour value.

We submitted the articles in the *Imperial Institute Gazette* and the *Pharmaceutical Journal* containing the reports referred to above, to an expert in the Citronella trade, who has been good enough to give us his opinion on the discussion, which we reproduce below. It will be seen that the differences in the qualities of the oil are really due to differences in the variety of the grass used, of which the English experimenters do not appear to have any knowledge. For this reason the opinion of our correspondent is of special value as settling a point which has apparently been giving rise to much misunderstanding:—

"There are two methods of distillation:

1. *Using Steam*.—Here the grass is placed in a cylindrical vessel which is closed, and steam, generated in a separate boiler, is let from the bottom of the vessel containing the grass: The steam passes upwards through the grass and in its passage extracts the oil.

2. *Using Fire-heat*.—In this process water and grass are put into one vessel and distillation

is carried on by heat applied directly to the bottom of this vessel.

It is not correct to say that the difference in the quality of oil is due to different modes of distillation, as I know of no still in which fire-heat is directly applied as described in the second process, and am certain that only a very small proportion of the oil sold commercially is distilled in that manner, steam distilling being easier and cheaper.

Adulteration used to be common, but the spirit test introduced about five years ago put a stop to this, though I believe that even with this test you cannot detect adulteration under five per cent.

The real difference is the quality of the oil traceable to the different varieties of the grasses employed. The original Citronella grass (which I still use for my oil) is a surface feeder, soon grows out of the ground and gets exhausted; but about twelve years ago a variety was found in the Matara district, which is much hardier, has deeper roots, and produces a larger quantity of oil. Of this latter variety nearly all native oil is made."

THE NUTMEG FAMILY AS A SOURCE OF KINO,

The order Myristicaceæ is represented in Ceylon by *Myristica laurifolia* (Malaboda), *M. zeylanica*, *M. horfieldia* (Ruk), and *M. Irya* (Irya).

The malaboda is commonly called the wild nutmeg and closely resembles the true nutmeg; its wood is sometimes used for making tea-boxes, but it is too light and soft for other purposes.

The male flowers of the Ruk are known to be very fragrant (resembling sandalwood oil), and Trimen mentions that scent is made from them, while the wood is used in boat building in the south of the Island.

Irya produces wood like that of Ruk, moderately heavy, even-grained and yellowish in colour.

M. fragrans, the true nutmeg tree, is now commonly met with in many places.

Other species of Myristica found in India are *M. longifolia* and *M. malabarica*. The last-mentioned is the subject of a note in the *Kew Bulletin* for Feb.-March, and is there referred to as a source of Kino.

The product of the tree was examined by Prof. Edward Schaer of Strasburg, who has written a paper on the subject to the *Pharmaceutical Journal*. The following is a summary of the results of the Professor's investigations:—

I. The dried juices of the bark of several Asiatic species of *Myristica*, for instance, of *M. malabarica* Lam., and *M. fragrans*, Houtt., as regards their appearance and physical qualities, show but little difference from the official Malabar Kino.

II. These substances, which may be termed Myristica Kinos, agree in the chemical reactions due to their constituents, in all important points, with the Kino of *Pterocarpus Marsupium*. It can therefore be stated that drugs of a very similar character, and partly of close resemblance to official kino, are to be found in the families of Leguminosæ (*Butea*, *Pterocarpus*, *Milletia*), Saxifragaceæ (*Ceratopetalum*), Myrtacæ (*Eucalyptus*, *Angophora*), and Myristicaceæ.

III. The *Myristica* Kinos differ, as far as can be observed from the *Pterocarpus* Kino, and probably also from *Butea* and *Eucalyptus* Kino by containing, in the crude state of the inspissated fresh juice, smaller or larger amounts of a distinctly crystalline calcium salt, viz., calcium tartrate, suspended in, and depositing from, the liquid juice. By this characteristic admixture it can be easily distinguished from the official Kino, and probably also from other Kinos of commerce.

Whether this new substance might ever be obtained in combination with the production of nutmegs and mace, so as to play the part of a commercial drug, will depend upon a still better knowledge of its qualities, its formation in the living plant, its quantitative relations, and similar questions.

It would be interesting to know whether it would not be possible to get Kino from the succulent pericarp of the nutmeg and allied fruits (which is at present a waste product) by a process of boiling.

DAIRY NOTES

Too much care cannot be bestowed on cows during their first milking season. If they are allowed to go dry too early, they are inclined to ease off the following season in like manner. It is the experience of the most observant dairy farmers, that if a cow is forced to go dry, some part of the udder suffers, and in some cases the permanent impairment of one or more of the teats. Evidently, the best plan is to let a cow milk the whole time if she will, right up to calving, as drying off requires more care than the ordinary milker is inclined to give. Cows are sensitive animals, and he's a wise man who treats them as such.

Mr. D. Hyam, Terrara, is one of the champion Illawarra dairy stock breeders. His three-quarter bred Jersey, 6 years old, Blossom, at 3 years and four months, won the butter test at Wollongong, testing 9.3, producing 2 lbs. commercial butter from 19 lbs. milk; in 1897, on the same show ground, she tested 8.2, gave 24 lbs. milk which produced 2 lbs. 3 oz. butter. Same year at Albion Park she took the butter prize for cow yielding largest butter-fat. At Berry, same year, she gave 29 lbs. milk in 12 hours producing 2 lbs. butter, equal to 27 lbs. butter per week—which is one of the world's records. At last Dapto Show she gave 30 lbs. of milk, testing 6.7, making 2 lbs. 5 oz. butter. His half-bred Jersey with Ayrshire, 6 year old "Jenny" won first for best dairy cow at Nowra in 1896; in 1897, 1st and champion at Dapto, 2nd at Albion Park, Kiama, and Wollongong; 1st at Nowra, and 1st and champion at Berry. This year 1st at Dapto and 1st and champion at Wollongong. Mr. Hyam has good pastures and hand feeds, when they are on tests, twice a day, giving them a three-gallon bucket of chaff and coconut oil cake.

Dairy farmers cannot pay too much heed in the selection of the bull for their herds. Every farmer can't afford an out-and-out first-class bull for his cows, so he has to put up with one in the district, whether 'tis good or bad; and he often lets a stray animal, that he knows very little about

mate with a good cow. There is money in a really good bull in dairy districts for the breeder, if he watched his opportunities as owners of stallions do.

Handle calves and get them familiar with you from birth; that is, those that are meant for the herd. Then, when they drop their first calf, and are ready for the milk pail, they come up to you without fear, and "let it go" like winking. If this isn't done, there is a lot of good time and good milk wasted.

A good dairy stock breeder will go less by breeds or types than actual individual milk results, as shown by careful separate tests. Dairy farmers have predilections for certain strains, and for large or small cows, but this bias shouldn't run away with their judgment.

Says the *Farm and Dairy* (Sydney):—Some condensed milk doesn't contain enough butter-fat in a dozen tins to oil the wing of a mosquito! We all know that by the modern system of milk separation fully 97 per cent of the butter-fat is extracted from the milk. Well now, some condensed milk makers eliminate the butter-fat, turn it into butter, and whisk up the solid refuse with sugar into "condensed milk." This stuff comes on to the market as a whole-milk product, whereas, it is a separated article, and, as a food, a mere worthless, indigestible compound. Only so recently as six weeks ago, three London grocers were proceeded against for selling tins of condensed milk not of the quality, nature and substance demanded. That is to say, the labels on the tins were delusive. The fact wasn't disclosed that the tins didn't contain whole milk, and the purchasing public were defrauded in consequence. Condensed milk is made at Colangatta and near Singleton, and, doubtless, they will be able to stand the test; also, possibly, some imported brands. On the other hand, some brands are not milk in the food sense at all, and shouldn't be allowed to be sold. Anyhow, before any prosecutions are instituted against our own dairymen for having milk a few points below par, let the authorities see that no imported "milk" goes forth for general consumption that is below the standard for butter-fat.

WOMEN AGRICULTURISTS.

From time immemorial women have been connected with agriculture, but only as helpers to man. A new era has dawned for woman in this respect in all parts of the world; she takes an interest more or less direct in nearly all branches of husbandry. But now that interest is to be carried a step further. Instead of being, as at first, the servant of man, or, as afterwards, as man's assistant or helpmeet, she will now assume the role of man's competitor. In an article from the pen of the Countess of Warwick, contributed to the Christmas number of the *Land Magazine*, a perfect scheme is laid down for women (unmarried women, as the Countess puts it) desirous of

escaping from city rack rents, and enjoying country pursuits. The immediate object of the scheme is threefold—

1. To open a new field of work for women.
2. To stay the depopulation of our rural districts!
3. To keep some of the money in this country which is annually spent in *foreign* dairy, poultry, and horticultural produce.

The Countess argues down any objections that might be brought up against the objects, and especially the first and third clauses. With the second we are not quite so sure. It is contended that the young men of our day have a tendency to leave the country and flock to the towns. To remedy this it is now attempted in this scheme to make amends for this by inducing the young women to flock to the country. We cannot perceive how the depopulation of the rural districts is to be prevented if such a state of things continues. Would it not be better to include in the scheme the idea that the presence of the emancipated, or shall we merely say sensible, women in the country would so attract the giddy young men that they would stay at home, and take a new lease of life as it were? An organisation is proposed to be formed under two distinct heads:—

1. To open an agricultural training college for women.
2. To establish women's agricultural settlements in different parts of the country.

It is intended to start the college at an early date, and it will be under the control of a lady principal, a lady by birth and education, and fully qualified to give instructions on two or three of the branches of the work to be carried out. The other instructions will be carried out by a thoroughly efficient staff of lecturers and practical instructors.

The practical work will include:—Dairy work in all its branches, pig keeping, poultry rearing, market gardening, fruit growing, bee keeping, jam making, bottling fruit, home made wines, &c.

The other details of management are all plainly set forth. These include the age (minimum 16), physical exercise and games, library, debating club, examinations and certificates, laying out of the ground, &c., &c.

Under the second heading, "Women's Agricultural Settlements," the plans are very complete in details: Each settlement shall consist of from 6 to 10 or 20 holdings or cottages, occupying from 1 to 4 acres, each holding to be occupied by two women settlers: A lady warden will have the control of each settlement as far as business (only) is concerned. Each settlement will have a factory, a creamery, central office and club room, but the entire management of the whole system will be directed from a central office in London. Co-operation will be the guiding spirit of the scheme.

The scheme is elaborate in detail, and quite within the possibility of actual fact, although the idea comes as something like a surprise to most of us. With Australians the idea will not "take on," but in a densely populated country like Great Britain we see no reason to doubt its taking a practical shape. And if young women take the lead in inaugurating such a system, who shall say that our men will not follow? We firmly believe that a tendency to go on the land, as a means of livelihood, will become stronger in the immediate future.

THE USES OF WOOD.

BY FILBERT ROTH,
*Expert in Timber Physics, Division of Forestry,
U.S. Department of Agriculture.*

GENERAL REMARKS.

Wood, like soil, air and water, has until recent times been one of those materials which man could obtain without effort beyond the mere taking. Hence, although it has become one of the most important, most generally used, and to our civilization most indispensable products of nature, our attitude toward its production has been one of indifference. Wood has been used so generally that a large amount of empirical knowledge regarding its properties has accumulated. This knowledge has sufficed for immediate purposes, and the need of a more intimate knowledge gained by investigation and experiment in regard to the properties and characteristics of wood has never become very apparent. Abundance and cheapness, together with ignorance of its true merits, have led to a most extravagant and often erroneous use of this product. We have witnessed with indifference, also, the useless destruction of enormous quantities of timber in the vague belief, characteristic of the times, that when the supply is gone some substitute will be found. That this belief is poorly founded is quite apparent, for while such substitution as, for instance, that of iron in ship, bridge, and track construction has taken place, and undoubtedly will continue and even increase in many directions it has not prevented, even in countries like England, where wood is dear, an increased consumption per capita of population, while Germany, with all its well-managed forests, imports great quantities of large-sized timber. Moreover, as we learn to know the properties of this material, we find that it is capable of many uses for which it was supposed the metals alone were fit; wood is today displacing the best qualities of steel even in such delicately balanced structures as the bicycle. That this return to wood in many of our manufactures will continue, in spite of the cheapness of iron and steel, there is not the slightest reason for doubt, and the importance of wood as a material of construction, to say nothing of its use as pulp, cellulose, and its derivatives, and its growing value as a fuel, will steadily increase and not decrease, as is so commonly assumed and taught.

Before entering into the discussion of the uses of different kinds of wood, and the reasons for their selection, it may be well to review the principal useful qualities of this material, and to some extent compare it with its most natural substitutes.

WOOD AS COMPARED WITH IRON.

1. Wood is a natural product; iron the product of a costly, complicated manufacture. Wood may be grown wherever man wishes to use it; the manufacture of iron is practically confined to particular localities. The mines of both iron and coal are exhaustible; the forest, under proper management, produces for ever.

2. Wood is cheap; metals are dear. Even in the form of lumber, and with the cost of long-distance transportation added, wood costs the consumer in

this country rarely more than 25 cents per cubic foot, while iron in bars and sheets is worth at wholesale from \$5 to \$10 per cubic foot.

3. Wood is soft; simple tools and small effort suffice to shape it. Iron is hard, any change of form, whether by casting, rolling, sawing, cutting, planing, turning, filing, boring or grinding, requires much labor, or else complicated and costly processes and equipments. In the ease and rapidity with which wood can be shaped, reshaped, and combined in structures it excels all other materials.

4. Wood cleaves or splits; metals do not. While this property has its disadvantages, it is one that in some directions determines the usefulness of wood. It permits ready preparation for fencing and firewood, which latter use exceeds in bulk ten times the amount of iron and steel used in this country.

5. Wood is stronger than is usually supposed. In tensile strength (pull lengthwise or with the grain of the wood) a bar of hickory exceeds a similar bar of wrought iron of the same length and weight, and it even surpasses steel under the same conditions.

Similarly, a select block of hickory or of long-leaf pine sustains a greater weight in compression endwise (parallel to the grain of the wood) than a block of wrought iron of the same height and weight, and nearly approaches cast iron in this respect.

6. Wood is very elastic and resists bending to a marked degree; and though the modulus of elasticity of iron as ordinarily stated appears 10 to 15 times as great as that of good ash or long-leaf pine, yet a square 10-foot bar of the latter wood requires 6 to 8 times as great a load to bend it by one inch as a similar bar of iron of the same length and weight. Moreover, wood endures a far greater distortion than the metals without receiving a "set" or permanent injury. It does not rust nor crystallize, but retains its quality, and being light, and therefore used in solid pieces, may be selected with perfect assurance of avoiding "flaws" which are so dangerous in all metals when used in small pieces combined to make a larger structure.

7. Wood is light; iron and steel are heavy. The average weight of all wood used in this country does not exceed 31 pounds per cubic foot; that of iron and steel is from 430 to 450 pounds per cubic foot. This quality effects ease of handling and transportation; it permits the floating of most woods when green and of all when dry, and with its superior strength and stiffness results in a saving of more than 75 per cent in the weight of structures, frames, floors furniture, etc.

(To be continued.)

PERFUME MAKING.

In answer to a correspondent enquiring as to the method of extracting scent from flowers, we give the following description of the two processes generally adopted:—

(1.) THE COLD PROCESS.

Procure trays with glass bottoms, spread clarified fat a quarter of an inch thick upon each side of the glass; gather the flowers early in the

morning, and spread thin upon the fat. Close the glass-sided box. Every second day replace the old flowers by fresh ones, and renew them twelve or fifteen times. Then scrape the fat from the trays, break it up into very small pieces and digest it in spirits of wine 60 over-proof, say two lbs. of fat to $2\frac{1}{2}$ lbs. of spirits. Stir every day for a month, keeping it covered. Then bottle and label it "Extract No. 1." Now add fresh alcohol to the fat (1 lb. is sufficient), and stir daily for a month. Pour it off then, and label the bottle "Extract No. 2." Do the same thing a third time, and so obtain "Extract No. 3." Now you had three bottles, all containing different strengths of extract, and all of value according to their strength. The fat is now melted in a *Bain Marie*, is poured off, and kept for next year.

(2.) THE HOT PROCESS.

Take, say 2 lbs. of flowers, being careful that there are no stems; put them in a round tin. Melt 4 lbs. of clarified fat with only just sufficient heat to melt it. Pour it over the flowers, and leave them covered till next day. Now get a larger dish with hot water to melt the fat, on the same principle as the glue-pot. This is called by the French a *Bain Marie*. Now take another round tin containing 2 lbs. weight of the same kind of flowers. Place two strips of wood on top of this to hold a sieve. Then pour in the melted fat from the first pan, thus straining the leaves and allowing the fat to fall on the fresh lot of leaves in the second tin underneath. Cover up and again leave till next day. Clean the first tin for the morrow, so as to repeat the operation each day for fourteen days, when the fat will be fully charged and is ready to be digested in spirits of wine as described above. Only sufficient heat is required to cause the fat to melt and flow, as the extracts are very volatile at a high temperature, and a great loss may be occasioned by over-heating the fat.

If more rose leaves are gathered than can be used on the same day, sprinkle them with salt, when they will hold their scent for a few days. This is called salting the leaves. For oils of the same plants coarse cotton cloths are imbued with the finest olive oil and laid upon a frame containing wire gauze in lieu of glass. On these the flowers are laid and suffered to remain until fresh flowers are procured. This operation is repeated several times, after which the cloths are subjected to great pressure to remove the now perfumed oil.

How to make the Clarified Fat.—Take 7 lbs. each of beef, mutton, and pork fat; chop fine on a board, and wash in clean cold water, then put in a boiler with five gallons of fresh water; put on the fire; add two oz. of alum and a handful of coarse salt and forty cloves; boil until all the fat is melted; then get another basin with five gallons of fresh water, and skim the fat through a wire strainer into the water; now boil the second time (adding the same quantity of salt and alum) for one hour, and then let cool. On each occasion of its cooling a dark-coloured sediment is found at the bottom. This must be carefully scraped away. When the fat is perfected white and pure throughout, it is remelted and put away for use.

How to make a Cheap Still.—Construct a metallic tank of about 100 gallons capacity, the interior fitted with a holed false bottom, about 9 inches from the base. Set in brickwork (although

this is not absolutely necessary) with a fire retort under it. A funnel about a foot in diameter at its greatest extent, with a rim to enter and a flange to support it, is fitted like a saucepan lid over a corresponding hole in the head of the tank. A pipe 2 inches in diameter—a continuation of the funnel—continues like a spiral worm around the interior woodwork of a barrel filled with cold water, the end projecting near the base like a faucet. This completes the apparatus. A five gallon still can be constructed for about \$25 (about £5).

How to Operate the Still.—The space below the false bottom of the still is occupied by water, in which a few pounds of salt or alum are dissolved to increase the boiling point. The tank is now filled with the desired flowers and the funnel-shaped lid is held in place by being screwed down and the joint packed with moist clay. A quick fire is lighted under the still, causing vapour, which percolating through the flowers lying over the false bottom releases the attar, and steam and oil go jointly up the funnel, and wind their way through the condensing corkscrew pipe. A stream of cold water running into the tub condenses the steam and oil, which flows into a glass jug placed at the lower end of the tube. The oil is seen floating on the top, and is skimmed off with a spatula or flat ivory paper knife, or can be sucked off with a pipette (glass pipe), a crystal tube having a bulb about three inches from one extremity. The distiller places one end in his mouth, and, lightly touching the filaments of essential oil with the other, draws them into the bulb.

If the same distilled water is employed several times over, it increases the output of oil. The temperature of the steam must not be too great, or the essential oil is likely to be injured. Time—about three hours. The false bottom containing the stewed leaves is hoisted out, and the mashed mass is useful as a fertiliser. This process applies only to the rose.

Pots of different scented flowers should not be grown too close as each will become tainted with the other and the virgin aroma of each will become confused. Plots of roses, or jasmine, or tube-roses should be separated by others growing vegetables or other scentless plants. The beds should run north and south so as to get the greatest benefit from the sunshine which is an important factor in the production of superior oil. As an adjunct to some regular form of cultivation, scent-making should always provide a nice sum of pocket-money. A few sheets of glass and some fat are practically the only necessities. The work is light and pleasant. Saturated lard is worth from £1 5s. to £1 10s. per lb. in London or Paris, and the spirit or "extract" is worth 3s. 6d per oz. or £3 10s. per pint. For the above information we are indebted to the *Queensland Agricultural Journal*.

GENERAL ITEMS.

Mr. Kershaw, who has been visiting the Australian Colonies, with a view to opening up a trade in certain cotton thread fabrics, of which he is an extensive manufacturer in Manchester, has been giving his views regarding fibre plants other than cotton. Speaking of ramie Mr. Kershaw was emphatic as to the superiority of

this fibre over jute. While the fine silk-like fabrics of jute can be distinguished from pure silk, it is impossible to do so in the case of ramie. As to the price quoted for ramie—£30 per ton for clean fibre—that was absurd. £30 per ton meant about 3½d. per lb., whilst the fibre commanded at least 6d. per lb. in the open market, or £56 per ton. The improved machinery would even have the effect of increasing the price. Ramie was a fibre that lent itself to the most delicate fabrics, as well as to the coarser ones. For his knowledge of the trade, and from what he had learnt whilst in the Colonies on the subject of the adaptability of the soil and climate of N.S. Wales and Queensland to the cultivation of the plant, he came to the conclusion that it was eminently worthy of attention.

The following cure for mange is from the *Queensland Agricultural Journal*:—Boiled linseed oil, sulphur, and kerosene equal parts. First mix the oil and sulphur, then add the kerosene, and mix well. Applied with a hard stubby brush. A tea spoonfull of carbolic acid to a pint of lard, stirred in and well mixed is also a good remedy.

Papaws are largely grown for fruit in Ceylon where it is also now being considerably used as a vegetable. The demand for the fruit, especially for the shipping, is great. There are three distinct varieties in cultivation, two of which produce huge fruits weighing up to 9 lbs. each. Lately, another variety referred to as the Singapore papaw, which is not large but has a characteristic flavour of its own, and turns golden when ripe, has been introduced; it was first grown by Mr. J. W. Ebert, who is well known as a cultivator of flowers and fruits in Colombo. It does not appear necessary to keep "male trees" in gardens, and these are generally destroyed, but sometimes these unsatisfactory specimens are topped—the operation requiring as a rule to be repeated often—till they become transformed into good fruiting trees. Papaw trees may be dioecious, monoecious, and even hermaphrodite.

Papaw juice is now worth 5s. per lb. The *Chemist and Druggist* says that it is best prepared by pressing it out of the unripe fruit, clarifying by filtration through a twill bag and fermenting the precipitate by alcohol. It is then dried and some purified by treatment with water.

The simplest way, says the *Queensland Agricultural Journal*, to tell the age of a fowl, and one which is adopted by the London poultry dealer, is to feel the breastbone, of the live bird. If the bone feels tender and supple like gristle, the bird is young. If, on the other hand, the bone feels hard and ridgy, the bird is fully matured, and very much so.

Paris Green or London Purple solution is an effective remedy against white ants. When they occur in walls, on the floor of buildings, on tennis courts or such places the stronger the solution the better, but care must be exercised in using the poison in the neighbourhood of plants.

The question has just cropped up in Scotland of the rights of women to study, obtain diplomas, and practice as veterinary surgeons in Great Britain. It arose peculiarly. The Principal of the new Veterinary College, Edinburgh, raised an action in that city for damages against the Royal College of Veterinary Surgeons, London, in respect that the latter refused to admit to the college examinations a lady student who had attended the requisite classes and obtained the necessary certificates. The action was dismissed, on the ground that it should not have been raised in the Scottish courts, so that it remains undecided whether or not a lady is eligible to become a veterinary surgeon. Surely there "is something rotten in the State of Denmark," when old-time prejudice blocks the paths of intellectual and social freedom in that way! If a woman is eligible by mental qualifications and physical fitness to follow the profession of veterinary surgeon, surely she should "be let." The mere question of sex in the matter of admission to the college should have no more to do with the Council of the Royal College of Veterinary Surgeons than whether the applicant wears tweeds or moleskins. It is not a question of pants or bloomers, but whether the applicant is, by virtue of his or her special attainments, sufficiently qualified to practice as a veterinary surgeon. Upon that issue, and that alone, the decision should be given.

The apple has been recommended far and near as the food of life. Now it will probably be the turn of the baked banana, which is being extolled in America as the ideal food for the nervous, the anæmic, and the brain worker. Bananas, it will be remembered, occupied a high place in the diet of the late Sir Isaac Holden, and without going so far as to say they are a panacea for all ills, it is asserted that their great power to sustain mental effort is recognised in India, and that pale, thin, poor-blooded people rapidly improve on adopting this diet. Whatever the value of the banana as an artificial diet, it is worth noticing that in the West Indian islands the cooked plantain, which is first cousin to the banana, forms one of the staple articles of the food of all classes of the community—baked, roasted, fried, or, if green boiled.—*Australian Tropicalist*.

From the *Meat Trades Journal* we learn that a case came on before the Warwick (England) County Bench against a farmer for "ill-treating twenty-one bullocks by dishorning them." The solicitor who prosecuted described dishorning as "a survival of a barbarous age," and the veterinary surgeon declared the operation to be a most painful one. It is news to be informed that dishorning was even practised before the present century, and we have sufficient acquaintance with the latest methods to know that the operation can be performed without pain, and even were there a slight pain, the work is done so quickly and faultlessly as to class it as painless. No doubt it would appear more humane to dishorn when the animals were young, but we must not ignore the fact that painless dishorning can be performed at any age.—*Ibid*:

COLOMBO, JUNE 1ST, 1898.

[No. 12.

A PIONEER PLANTATION IN CEYLON AND A SOLDIER PLANTER.

COFFEE—TEA—CACAO:—IN THE DUMBARA
VALLEY.

[We are much indebted to the London friend who writes:—"You have published Memoirs of many of the Pioneer Planters. Would your readers care for one of the Pioneer Plantations? If so, the enclosed may interest you. I think all the figures and statements can be depended on as far as they go, if you put them into shape."—We are exceedingly pleased to have the following most interesting contribution, and to see that it tells us a good deal about a distinguished soldier-planter as well as about his plantation; and also gives us the story of the very beginning of Coffee; and afterwards of experiments in Tea; and later still describes Cacao cultivation in the Dumbara Valley.—Ed. "T.A."]

In some respects the history of THE RAJAWELLA ESTATES may be considered interesting if only as illustrating the more general story of Ceylon as a "Plantation Colony."

It commences on the 18th June, 1836, when a tract of Government forest land called Diabululawella and Rajawella, situated at Kcngalle in the Oodoogampattu Korale of Dumbara, consisting of 1,583 acres, was granted by His Excellency the Rt. Hon. R. Wilmot Horton, Baronet, Knight of the Rl. Guelphic Order, Governor, &c., of Ceylon, (in consideration of the payment of £395 16s. 9d.) to the Hon. George Turuour, Esq. and Colonel Martin Lindsay, C.B.; and was opened by them as a Coffee Plantation.

There have been some additions and subtractions from the acreages of this gran; but much is still

owned by the Colonel's grandsons, Messrs. Martin Hadden and Charles & Martin Pirie.

Colouel Lindsay, a well-bred Scotchman and tough old soldier, had entered the Army in 1794 (above 104 years ago) at the early age of 12, and had seen much active service with the 78th Highlanders in India, Java, and Holland, in the great struggle with Napoleon Bonaparte. In the actions at the taking of Java he commanded the regiment as Major, the Colonel of it being shot, it was said, by his own men. In Holland at the attack on Merxem, January 1814, Licut.-Col. Lindsay (promoted Lt.-Col. 1813 won his C.B., heading the gallant 78th in a bayonet charge which decided the day. He had his grey charger shot under him. He distinguished himself also at the bombardment of Autwerp, and indeed wherever he fought.

In 1826, Colonel Lindsay brought his Highlanders to Ceylon. He filled various civil and military posts here, until 1835, when he retired from the Army. In 1828 he was appointed First Commissiouer for the Kandyan Province, and in early days turned his attention to Coffee planting as we have seen, in conjunction with his old friend and associate in office, the Hon. George Turnour. It used to be said that these old friends and associates in office were helped not a little in their Coffee ventures by commissariat carts in transport, and in various other ways* This may be only the ill-natured or envious remarks of some with less suitable land; for, as always happens, very many of the pioneers were unfortunate in their choice of land. They were all helped at first by "Protection," differential duties in their favour against Brazil rivals, and others; and for awhile by good prices.

* Even within our day, the Postmaster-General of Ceylon, old Major Barton, who fought at Waterloo, used to "frauk" his daily supply of "oats" for a race-horse in training, through the post from Colombo to Nuwara Eliya.—Ed. T.A.

It may interest some to read an estimate made in October, 1839, for opening 100 acres Coffee, when prices stood at 70s. to 80s. net. It is based, it will be seen, on a yield of 5 cwt. per acre and a "safe" net price of 60s. It was sent to Mr. Alexander Hadden, then a member of the firm of William Nicol & Co., Merchants, Bombay, probably by the Hon. George Turnour, possibly by Mr. Hew Stuart. It apparently induced him to make a venture as a Coffee planter, and more or less opened up a Ceylon connection with his firm which lasted long after he had retired from it, bringing to Ceylon Andrew Nicol and many others:—

Copy of Report sent via Bombay under date, October, 1839.

"In the district of Colombo agricultural labour is generally paid at the rate of 4½d. and in Kandy at 6d. per day. In general the Kandians are unwilling to engage as labourers; but the increasing demand is supplied by coolies from the Malabar Coast, who are continually coming over and locating.

"In the following Estimate of the Expense and Receipts of a Coffee Plantation, the land is supposed to stand in at £5 an acre when cleared. Forest land may be bought at 5s. an acre and cleared by contract at £2 10s.; but when to this the expense of making roads, fences, and superintendence is added, the cost cannot be calculated at less than £5.

"In Brazil it is usual to estimate the produce of a Coffee bush at the average of one pound per bush, but in the estimate below, half pound per bush only is taken. A Coffee Plantation cannot be considered as in full bearing until the fifth year, but the produce of the third and fourth years are calculated to equal a full year's crop. The value of the Coffee is estimated at 60s. per cwt. (present value is from 70s. to 80s in Ceylon).

"Expenses for 100 Acres.

100 acres cleared at £5 per acre . . .	£500	0	0
25 coolies at £7 16s. per annum or 6d. per day for 4 years	780	0	0
Superintendence and incidental expenses	780	0	0
100,000 Coffee plants at 6d. per 100 the regular price, 1,000 Coffee plants to an acre	25	0	0
Bungalow (house) and tools	150	0	0
To which add expense of plucking, drying and cleaning from the husk, the estimated crop 491 cwt.	122	15	0
	<hr/>	<hr/>	<hr/>
	£2,357	15	0

Receipts.

100 acres each containing 1,000 plants, each producing ½ lb. = 491 cwt. at £3 per cwt.	1,473	0	0
Less Cooly Lines and Superintendence for the fifth and following years	390	0	0
	<hr/>	<hr/>	<hr/>
	£1,083	0	0

Mr. Alexander Hadden, influenced by Colonel Lindsay's prosperity with Rajawella and this Estimate, opened in 1840 Dodangtalawa, an estate of 120 to 150 acres between Matale and Kurunegala, His partners Wright and Smith (in later years Smith, Fleming & Co. of London,) joining in the venture; but Coffee was not a success there. In 1846 it produced some 650 to 700 cwt. coffee of inferior quality, beans very small, and eventually the place had to be abandoned. His brother, Mr. Charles S. Hadden, the present owner of Kotiyagalla, Bogawantalawa, and his cousin the late Mr. Fred. J. Hadden, were more fortunate than their Bombay relative at this time, though they also went somewhat wrong in the choice of land at first, settling down in Ambaganuwa. However, they were shrewd men, had no other business to occupy their chief thoughts, were practical planters very soon, discovered their mistake in good time, and having command of capital, promptly moved into Hunasgeriya, where they did well with that glorious old

estate Weygalla. The Rajawella estates paid Mr. Turnour and the Colonel very well for some years.

In 1844, £70,000 was offered for these estates by a Mr. Antobus of Paris, but the offer was not accepted; for in the previous year they had yielded some £14,000 to the proprietors; there was nothing in their respective positions to make either of them anxious to sell; and who without some degree of urgency could part on a "5 years' purchase" with property so rapidly increasing in value? As things turned out unless Mr. Turnour and Colonel Lindsay were level-headed far beyond the average of men, it was probably as fortunate for them that they did not sell even for £70,000 what had cost them but £8,000, for those were days of inflation, and likely enough much of the proceeds would have been lost in the panic times that so closely followed—lost through one of the many Bank failures if uninvested, or through the general shrinkage of values if invested.

Late in 1844 the Hon. George Turnour died at Naples, and his Executor, Capt. H. A. Atchison, had to close the partnership; so the Rajawellas were put up for sale in five lots in February, 1846. They realised £25,170. Colonel Martin Lindsay bought lots which were numbered 1, 3 and 5 at £14,260, and Robert Boyd Tytler with Thos. Charles Morton lots 2 and 4 for £10,910.

In January, 1847, the Colonel also died, and left his portion as a provision for his widow and family. He had married a Miss Hadden in 1817 at Aberdeen, then and for many years afterwards a bright little Northern Capital, with all that implies, in connection with gaiety and good society. He died on a visit to Ceylon at Kandy, 28th January; and, though he had become a civilian, was buried in the Churchyard there with military honours rendered by Colonel Drought and the XVth regiment, as may be read by those who are fortunate enough to possess the *Ceylon Observer* of 29th January, 1847, where an account of the military funeral is fully set forth and much said of this "fine old gentleman."

He had not been dead many months when very dark days came. The year 1847 was memorable of financial troubles all over the world, and at the close of it and beginning of 1848 raged a Commercial Panic such as has not been known since. Consols fell from 94 to 78½. Not in the political complications that followed did Consols fall below 83, even when Revolution in France drove Louis Philippe from his throne. Hungary nearly separated from Austria, and the whole Continent seethed in discontent, troubles, and war, and Chartist riots kept people in a ferment at home. Ceylon Plantation Coffee, good quality on 4th January, 1848, was down at 40s. to 42s. in Mincing Lane. Native Coffee at one time was sold there at 19s. a cwt. 3,000 bags were sold at that figure by a much respected Broker who now no longer connected with Produce is still alive and very much to the fore in other lines.

The Commercial failures at the end of 1847 and in January, 1848, were appalling. They were announced daily, and in all trades—among Continental Houses, in American, in African and in West Indian Trades, and not least in the East Indian Trade. Calcutta Houses went down before the storm as fields of oats in an autumn gale. Cockerill & Co.; Colville, Gilmore & Co.; Lyall, Matheson & Co.; Hughesdon Brothers & Co.; Shearman, Mullins & Co.; and many others too numerous to enumerate. Glyn & Co.; London, refused in one day the drafts of the Union Bank of Calcutta and of the North-Western Bank of India. Those who had remittances to make were sorely put to. Private firms seemed to be all going down together, and Banks seemed to promise very little more stability than the private firms. In the general distrust recourse was had to specie to an extent this generation can scarcely realise; and bullion was travelling Eastwards and Westwards at the same time, as almost the only trustworthy means of making a remittance. The climax seemed to be reached when the great firms of Gower Brothers & Co.; and Reid, Irving & Co., of London failed. Abel L. Gowe.

was a Director of the Bank of England. Sir John Rae Reid, Bart., was one also. He had been Governor in 1839. John Cockerill had been on the same board. The senior of W. R. Robertson & Co., who failed in the corn trade, was Governor of the Bank when he failed: one nominated to fill a vacancy failed before the formalities of electing him could be carried through. No position in the City seemed then to testify to any solvency. A spirit of the very wildest speculation had become general in the world and this was the reaction. The speculative impulse which was first manifested at home chiefly in dealings in Railway stocks, had spread among all ranks and classes and into all trades. The result was collapse and panic. The purely mercantile troubles were aggravated intensely by crushing commitments for railway calls which had to be met and paid up whatever the state of the money market. These calls amounted to 22 millions in one half year and 3 or 4 millions during one single month in these bad times. The Bank Act had to be suspended. The minimum Bank Rate was 3 per cent. with very little to be had at that rate even on good security, and a rate equal to 13 per cent. per annum was paid for the discount of £10,000 City Bankers' acceptances within seven days of maturity.

The steady and prudent, as now, were in the majority both among individuals and firms; but for the while they seemed lost sight of, first in the wild days of speculation, and then in the turmoil of liquidation and failures that followed. When the storm had passed over and the atmosphere had cleared, these stood out who had weathered it and preserved the good name of the British Merchant for meeting the liabilities he undertakes to meet, and these were still the many.

The present times are by no means free from the spirit of speculation, and it is not amiss occasionally to cast a glance on the consequences to an earlier generation. Ceylon, not having escaped the infection of speculation, did not escape the wide-spread troubles that followed, as any may read in Ferguson's "Ceylon Handbook and Directory," and as shown in the failures of the Bank of Ceylon, Hudson, Chandler & Co., and others. In the "Handbook," confined to Ceylon affairs, there is naturally much said about the results of the speculations in Coffee in this Island with quotations from Sir Emerson Tennent, perhaps rather as if it were a thing of itself and not part of a world-wide trouble; but as we have seen the spirit of speculation of those days was not in any way or degree confined to Ceylon, nor was the epidemic more virulent here than elsewhere. The rush into Coffee here was only a sign of the times and of what was going on elsewhere. There was nothing in common between the failure of the Bank of Ceylon, and the great house of Prime, Ward & Co., Baring's correspondents in New York, except that both were results of the mad speculation that had raged; or between Hudson, Chandler & Co., Colombo, and the corn-trade house of the Governor Robertson of the Bank of England. The wild rush into Ceylon Coffee by military, civilians, clergy and East Indian officers, as described by Tennent, was another feature of the same classes in Europe more wildly rushing into railway shares and saddling themselves with liabilities for calls. The fever of speculation was an epidemic which had seized the many at home as here in the East and raged in America and elsewhere as violently. Now severe as the reaction was in Ceylon, there was not the extreme distress of some places, probably because there had not been the same inflation—not the distress for instance that there was in Mauritius, when Reid, Irving's failure was announced in December, 1847. To that Colony might have been applied the description of Liverpool at this time on the failure of the Royal Bank of Liverpool—"it reeled and staggered like a drunken man." Still in Colombo things were bad enough and money terribly scarce.

The Lindsay Rajawellas then had passed under the very free or extravagant management of Mr. David Baird Lindsay, an able determined energetic young son and ex-

ecutor of the Colonel, christened after his father's companion in arms, Sir David Baird, the hero of Seringapatam, at one time the rival of Sir Arthur Wellesley.* The estates needed funds that were not to be found in Colombo, and Mr. Lindsay went home in order to obtain the needful, first making that arrangement with the Oriental Bank that was afterwards so profitable to the lawyers in the Island and in Westminster. We have no need to enter on the particulars of that long dispute, except to say time pressed, the arrangement was made in a hurry, at a period of excitement, and therefore probably ill-considered. Each party doubtless acted *bona fide*, but the result was that when Mr. Lindsay returned he found the estates in the hands of the Bank, that the Courts of Law in the Island† said they were rightly in the Bank's hands, and the Privy Council 23rd June, 1860, said they were wrongly in those hands, and ordered them to be restored to the Lindsays and Haddens with back profits and interest £28,525.

After this the history of the Rajawellas is more or less that of most other estates. For family reasons and for convenience in working they were made into a Company in 1863, and valued by Mr. Simon Keir, of Keir, Dundas & Co., at £45,000. They yielded fair Coffee crops for awhile. They had yielded 6,400 cwts. in 1857-58, and 6,822 in 1859-60; and an average of 5,100 cwts. in the 7 years 1853 to 1860. In 1862-63 they gave 5,635 cwts., and in "the seventies" averaged under 1,900 cwts. Succumbing to leaf disease they never saw 1,900 cwts. afterwards, and Rajawellas coffee days are now almost represented only by a fig tree stem in the rooms of the Ceylon Association in London, taken home by the late Peter Moir as a memento.‡

Prices of the Coffee crops varied from a nett of 47s. 6d. in 1867-68 to a nett of 100s. 3d. in 1873-74.

Tea was planted by order of Mr. D. B. Lindsay (who already had a sort of speaking acquaintance with it in India), in the "sixties," with seed he obtained about 1864 from Calcutta; and a chest as sample was despatched home at the end of 1871 to be reported on. It was condemned unsparsingly but deservedly by a firm of highest rank as Tea Brokers. We give the Report as below:—

Report on two boxes Tea ex "Oxfordshire"
19th April, 1872.

"Though one is called black and the other green, both have the characteristics of the first, and that of the most ordinary description, and as a marketable commodity they are worthless. The tea called green shows signs of some attempt at manufacture as there is a considerable portion of fair twisted black leaves in it. The tea called black is chiefly open half-curved leaf, and how any one could consider that such would pass as "tea" surprises us. However, looking at the future of the garden, the inspection of the leaf after infusion indicates that considerable improvement could be made in both the 'withering' and 'fermenting' processes connected with the manufacture. But we should hesitate to give an opinion as to whether the tea can ever be brought up to a high standard as the color of the water is so pale and the flavour so remarkably thin and poor.

* When Sir David Baird's mother in Scotland heard that her son was a prisoner, chained to another man by Tipoo Sahib in Seringapatam, her characteristic remark was: "God help the man that is chained to our Davie,"—a rough-tempered customer evidently, but a splendid soldier and general as he afterward showed.—Ed. T.A.

† The Kandy District Court gave against the Bank; the Supreme Court for it. The Privy Council's judgment was a triumph for Mr. Tom Power, D.J.—Ed. T.A.

‡ As we drove through Dumbara and Teldeniya in 1865, Mr. Edward Mortimer, still alive, shouted: "Are you not coming to see 15 cwt. Coffee an acre on Rajawella?"—Ed. T.A.

Still, a proper process of manufacture would make a very great alteration in this as well as in the appearance of the leaf."

The Tea was plucked from trees over 6 ft. high. They had never been pruned. It naturally had been most crudely cured; the curer had no experience, no books, no machinery to help him. He lunged now over his attempts at withering the leaf by putting it into the firing pan, taking it out and rolling it, and so on, until he considered the tea was made. He was not very surprised to hear that it was too rasping for the English, but might possibly suit Holland or Russia; He could not easily have even a talk with any who had experience. He did his best from a description of the necessary operations written by Mr. Lindsay; but the great fault in the Tea sample was its emanating from a place unrecognised as a Tea-producing country; for no set of men are more conservative than those in Mincing Lane; anything new stiffens their backs and sets their countenances, as was shown when Cinchona bark was first sent to them from Ceylon. The drug brokers with one or two exceptions, scorned the suggestion of it being something worthy of their attention. Cinchona had never come from Ceylon, but from South Africa—was not that enough? The consequence of this attitude was that the sale of much of the Ceylon product, probably the bulk of it, went into the hands of the Coffee Brokers who at the beginning knew no more about it as a marketable article than the planters who grew it.

Be this as it may, the chilling reception given in Mincing Lane to the first attempts at Tea on the Rajawellas, the difficulties in making the Tea with no one on the estate or easily procurable who knew the process, and the absence of a principal, caused the attempt to be abandoned. It was not for many years that it was renewed. There are now 150 acres of promising Tea, and the area will no doubt be extended even with present low prices. We learn from the present Superintendent, Mr. C. W. Sinclair, that the 34 years old tea on Rajawella is represented by a few scattered miserable looking shrubs: it has always been in dense shade, never cultivated, and stands in poor washed out gravel thinly overlying limestone."

Cacao was first seriously planted on the Rajawellas in 1877-78, the proprietors putting out that season 60,000 plants, calculated as 150 acres, in alarm at the havoc in the Coffee by leaf disease, and encouraged at the growth of some 20,000 Cacao plants with which they had then already experimented. They calculated on the plants bearing at about 4 years old, and on their being in full bearing at 8 or 9 years, and producing then 9 to 10 cwt. per acre. After 1877 the area under Cacao cultivation was steadily extended.

In March, 1881, the estates were considered by a competent valuer as then worth £25,000, and he estimated they would be worth £31,000 by March, 1882, and above R500,000 by 1887 for Cacao alone, on an 8 years' purchase; but basing his calculations on 650 acres yielding by that time 5 cwts. per acre worth R35 per cwt.

In connection with our glance at days gone by, we may perhaps relate an incident that happened to Mr. Alexander Hadden, whom we have already mentioned, when he came down from Bombay to look after his Coffee venture in 1846, and see his many connections and friends in the Island; for it was an experience that would not be likely to befall an everyday visitor now, coming to the Island to view his property. He was in the good ship the "Recovery" which carried a number of convicts. (Those who mark coincidences may note it was his third voyage to and from Ceylon.) When off Goa at 3 p.m. the 3rd Feb. "Gang No. 3" made a rush up the hatchway, disarmed the sentries, got on deck, and, in number 20 or 30, made for the Captain, who was unarmed, but hearing the commotion and not realising what it was, naturally went forward to see what it was all about. Mr. Hadden, who was with

him, more instantly taking in the situation, ran off to the Captain's cabin, picked up two double-barrelled pistols with necessary ammunition, and firing at the felons as he returned, was quickly back at the Captain's side, slipping one of the pistols into his hand and reloading his own (for these were days before Otterell's and revolvers). The first shot checked the convicts' advance, they hesitated, and as soon as the Captain had fired the revolt was practically over. He, one Johnston, a well-known Captain in his day, managed rather well; for as soon as he saw the convicts on the deck hesitate, retreat and show there was no fight in them, he confined himself to shots at any fresh heads that came up the hatchway as reinforcements, making them promptly disappear. Meanwhile, three or four muskets were got together and fired also, and the scourgings of Bombay and upcountry jails driven below. The whole affair lasted only three or four minutes. When it was over a Sepoy of the guard was found rather badly wounded in the head by a carpenter's large hammer which the ruffians had somehow managed to lay hold of and apply with effect. One of the convicts was killed by a musket ball; and five were wounded—four by pistol shots. After this brush the Captain had twenty well flogged, three dozen each, well laid on, and the stream cable put through the whole of their irons with the two ends brought on deck, except when the prisoners, two or three shackled together, were brought up for a wash. So they had no other chance of taking the "Recovery's" before she arrived in Colombo on the evening of 16th February, when Mr. Hadden left her, and was immediately informed that the Rajawellas were to be offered for public sale on 21st with the low limit on them of £25,000. It seemed to him a very low limit, when only two years before the places had been all but sold for £70,000; but low as it was, it was about all that was then attainable.

These figures certainly show great fluctuations:—			
What cost	1839	and to open	£8,000
was valued	1844		70,000
and "	1846		25,170
And the part			
that cost	1846	£14,260	
with additions say		£ 1,740	= £16,000
was valued	1863		£45,900
and "	1881	at £25,000 or	£31,000
and then expected to be worth	1888		£50,000

There were, however, very special circumstances connected with all these fluctuations. If the £70,000 of 1844 was an "inflated value" it was at all events based on what the property had yielded, and within 20 years it was far exceeded if Mr. Simon Keir can be at all trusted. If the fall in 1846 to £25,000 was a reaction from the previous inflation, it was still well above 300 per cent advance on what the estate had cost the partnership, and what a magnificent income had been drawn meanwhile! Moreover, the fall might well have been expected to be far more severe, for it was aggravated by many very adverse circumstances, including the severest monetary pressure and the threat of "Free Trade," i.e., the abolition of those preferential duties that had contributed to the large profits. All letters from planters of this date are full of alarm at the certain ruin that awaited plantations under free trade. It was a very real terror to planters and intending investors. Free trade, however, became an accomplished fact, and the estates under it recovered in value nearly 300 per cent as Coffee property, and even when coffee, was *in extremis*, the estates were valued at 100 per cent above the price the Colonel gave for them on the death of his partner.

What strikes the observer in all this, is the speedy recovery even from extreme depression in Ceylon, if these Rajawellas are to be accepted at all as a type. If so the fair lesson seems to be that if you have Ceylon property you should stick to it. However dark the day, you may reasonably hope for brighter

times soon, and the recovery in a shorter period than would be probable in most countries. It may be just as well for a proprietor not to content himself with doing nought except sitting down and lamenting the bad times and waiting till the clouds roll by, but to exert, and in addition to energy, apply common sense to the problem how to quicken the advent of the better days. Then judging by the past the revival will not be far off. Compare things at home. Railways have even yet scarcely seen their stock back at the values of 1844. When we see good Ceylon estates being sold by the "unco" prudent because having passed through times in which they could not sell, an opportunity is presented of getting out of such a land of ruin, or because they see of fancy further ills threatening them, we are reminded of a story of Duncan Forbes of Culloeden or an Innos of Edingicht in Banff when in company with some fellow-lairds, high Conservatives, out of humour with the progress of free trade and other changes, who declared that there was nothing but ruin before landowners in Scotland, and that it was "no longer a place for a gentleman to live in." "Weel," says Edingicht, "I hae jist ae faut to this lan' and that is that I hae 'na a bittie mair o't.' There are some in Ceylon who would be the better for discussing the land question with this old Banff worthy. On the other hand there is many a young planter in the island as good as any of those of the early days who finds but one fault with the land now so much in the hands of Companies, and that is that he has not a bit more of it.

WOOD-ASHES.

We learn from a report by R. Harcourt, B.S.A., Assistant Chemist, O.A.C. Guelph, that there is a growing interest in the subject of wood-ashes, and their use as a fertiliser. This is largely owing to the fact that long cultivated lands are beginning to show a lack of fertilising constituents that are supplied by ashes, and to a desire on the part of the cultivator of the soil to increase and improve his crops.

The growing plant gathers all its mineral constituents from the soil in which it lives, and these, not being combustible, are left as ash when the plant is burned; consequently, the ash must contain all the mineral constituents that are essential to growth. These are potash, phosphoric acid, lime, magnesia, iron, and sulphur. These substances form a very small part of a plant, yet without them no plant could grow and produce seed; in fact, they are indispensable to life. Of the six essential plant-food substances named, potash and phosphoric acid are the most important, not only because they are taken up by the plant in large quantities, but also from the fact that our average soils do not contain them any too abundantly. Wood ashes, therefore, are usually valued according to the amount of those two constituents which they contain. Although potash and phosphoric acid are the most valuable plant-food substances in ashes, yet ashes also contain large quantities of lime, which is of considerable value to the growing plant. Lime is usually present in most garden soils in sufficient quantities to supply the wants of plant-growth, yet its application may produce marked effects. By acting chemically on certain constituents in the soil, plant-food, especially potash, is brought into an available form. It neutralises the free acid of the soil, and thus helps along the process by which vegetable matter is changed into a form in which the plant may make use of its

nitrogen. It also tends to improve the mechanical condition of both clayey and sandy soils.

The amount of these fertilising constituents contained in an ash will vary according to the source from which it is derived. The ash from young branches will be richer in potash than that from the older parts of the tree. Different soils will supply varying quantities of potash, phosphoric acid, and lime. The following table gives the composition of a few of the more common ashes analysed by Mr. Harcourt. The figures given express the percentages of the various constituents in the dry ash:—

Constituents in Wood-ashes per Cent.

Ashes from:—	Potash.	Phosphoric Acid.	Lime.	Magnesia.	Iron.	Sulphuric Acid.
Maple ..	9.31	2.08	45.24	1.14
Peech ..	7.53	1.39	41.21	6.16	0.30	traces
Cedar ...	3.30	0.98	49.06	2.49	0.70	0.77
Swamp Elm	35.37	0.45	23.64	6.48	0.19	traces
Black ash..	25.30	1.20	49.04	7.42	0.22	0.71
Hard coal..	traces	0.16	traces	..	5.32	0.41

The figures show clearly why ash buyers are so anxious to get black ash or swamp Elm ashes, but at the same time, it must not be forgotten that these ashes are very light and bulky; consequently, there may be more potash in one measured bushel of hard Maple-ash than in the same bulk of swamp Elm-ash. The hard woods contain a larger quantity of phosphoric acid and the soft woods. Cedar, as would be expected, is poor in both potash and phosphoric acid. The best way to ascertain the true value of ashes is to note the increased yield when they are applied to crops requiring potash, such as Potatoes, Carrots, Grape-Vines, and fruit-trees generally.

The caring for and application of ashes must receive special attention. If not properly stored while accumulating, much of the soluble plant-food will be lost by leaching. If not applied to those plants which are in special need of potash, no noticeable results may be obtained. Further, if mixed with farmyard or stable manure they may do more harm than good, because they tend to liberate, as ammonia, the nitrogen of the manure. If we may judge by the amount used by fruit-growers in the best fruit districts of the United States and Canada, they are fully aware of the value of wood-ashes in the orchard. J. J. WILLIS, Harpenden.—*Gardeners' Chronicle.*

ORANGE-GROWING IN JAFFA.

BY REINHOLD PALMER, JERUSALEM.

That much-prized fruit, the Jaffa, Orange, is now so well known and appreciated in England that it may interest readers of this journal to learn some details of the method of its cultivation.

The name by which this variety of orange is known in England is derived from the place where it is cultivated, the growing and prosperous little town of Jaffa on the coast of Syria, so well known to those who have visited Jerusalem, for which it is the port. In the vernacular the name for orange is 'Portugan,' doubtless a corruption of the word Portugal, and is an indication that the orange was probably in the first instance introduced into Palestine from Portugal; but as it is not recorded when or by whom this tree was thus introduced, the origin of the name can only be a matter of surmise. Although not a native of Syria, it thrives on the sandy coast of that country better probably than anywhere else in the world, the climatic conditions—the rainless summer, accompanied by heavy night-dews, and the winter without frost—being well suited to the growth and development of the fruit. But the culture must of course be supported throughout the long summer by artificial irrigation. Were

it not that water to any amount can be procured in every garden and at a moderate depth, it would be impossible to grow oranges in Jaffa. The whole neighbourhood seems to cover a river of vast breadth, percolating through the sand *en route* to the sea. Hundreds of Persian wheels working night and day produce no sensible diminution in the supply of life-giving water.

Several varieties of the orange, such as the round Beladi, the Blood Orange, the Mandarin, &c., thrive along the coast of Syria, but the oval and almost pipless kind known as the Jaffa Orange is only produced in Jaffa itself and its vicinity; and this peculiarity, according to the native gardeners, must be attributed to the quality of the brackish water used in its irrigation. Until about thirty years ago this oval form was quite unknown, when a native gardener, quite by chance, through careful attention to his trees, succeeded, much to his own astonishment no doubt, in improving his Beladi or Spanish variety of orange into the Shamuti, by which name the Jaffa kind is known in the vernacular. By selling grafts from his improved variety to other garden proprietors, he was instrumental in substituting the Shamuti for the Beladi orange throughout Jaffa. It is a remarkable fact that all attempts hitherto made at growing the oval orange elsewhere than at Jaffa have not been successful; even at Sidon and Tripoli on the Syrian coast, where the climate and soil seem precisely of the same nature as at Jaffa, all experiments in this direction have failed.

The method of laying out a garden in Jaffa is as follows. The land having been carefully selected and purchased—preference being always given to a red sandy soil—the owner will get in his workmen and start them on levelling and working up the ground. This is very thoroughly done; the levelling of the earth being important with a view to the future irrigating of the orange trees. The ground is in the first instance well ploughed, and then with the object of effectually removing every particle of weed, the workmen use their hoes to turn up the soil to a depth of fully three feet. This expensive process is very necessary, as the presence of even the smallest root of a weed will prove injurious to the trees and be difficult to remove later on. While this work is going on the proprietor will have fixed upon the spot where the well is to be sunk, and have commenced operations. The depth at which water is found varies materially in different gardens, and ranges from about twelve to sixty feet below the surface; consequently the cost of sinking his well is always more or less a matter of speculation to the proprietor. The deeper wells are, however, the exception and not the rule. The system of irrigating is by Persian wheels, simple in construction, cheap, quickly made and repaired; and experience has shown that they are much better adapted for the purpose intended than the steam pump. The whole of this simple machinery is quickly specified and described. A wide cog-wheel is kept going horizontally by a mule with a sweep; this turns a larger one perpendicularly, which is directly above the mouth of the well. Over this revolve two thick ropes, and upon these are fastened small wooden buckets; one side descends while the other rises carrying the buckets with them, these descending empty, those ascending full; and as they pass over the top they discharge the water into a trough which conveys it into an adjoining tank. The quantity of water discharged within the twenty-four hours depends on the speed at which the mule is kept going, and also, of course, on the depth of the well. An average sized garden requires the constant labour of three to four mules to provide the necessary amount of water, the animals being relieved about every three hours.

The ground prepared and manured, the Persian wheel fixed, and accommodation—of the simplest kind of course—being provided for the gardener and the mules, the proprietor now proceeds to buy young lemon trees about a year old. These are meant to be used as stocks upon which the orange slips are later on grafted; and of them there is always a fair supply available in the nurseries of the older

gardens. These lemon trees are now planted, under the supervision of the head-gardener, at a distance of four yards apart, and the most suitable time for this operation is during the months of March and April, before the great heat has set in. A hedge of cactus or prickly pear is planted at the same time round the garden, which in a few years' time grows into an impenetrable mass, preventing the intrusion of man or beast.

The young lemon trees will now thrive without much further attention, except that they must be carefully irrigated; this is done by a system of small masonry troughs running in all directions through the garden, and fed from the tank adjoining the well. The garden is generally divided into four equal parts, each part being irrigated within the course of two days, so that every tree receives its share of water every eighth day in rotation; and this is considered ample. A small trench is dug round each tree sufficiently large to hold its requirement of water, and as the tree grows and needs a larger supply, the trench is enlarged; the amount of water that will eventually be required must therefore be calculated on the basis of the irrigation necessary when the trees are six years old, and may be said to have reached maturity. If the garden is a full-sized one and contains about six thousand trees, it will be necessary to sink either two wells or one well sufficiently wide to admit a double set of buckets, thus raising double the quantity of a single set in the same space of time.

During the winter months the garden is left to itself, the garden employing his time in taking the mules to graze, thus saving the cost of feed. The winter (or rather rains) over, the garden is weeded, manure is worked into the soil, and the trenches round the trees are remade and enlarged. Irrigating commences about the end of June, and lasts till the end of October or middle of November.

In order to recoup himself or his outlay while the trees are growing, the proprietor will sometimes arrange with his gardener to grow vegetables in the empty spaces between the young trees, giving him the seed and one-third to one-half the produce of the vegetables in lieu of wages. This system is, however, not considered economical in the long run, as the trees, which are purposely grown in close proximity to each other, really require the whole of the soil; and their development and productiveness is retarded by the growing of vegetables.

The young lemon trees are allowed to grow for two summers before the orange slip is grafted upon them; this operation is performed in the autumn by the head-gardener, who is an adept at this work. After the fourth summer, calculating from the time the lemon stock was planted, a few oranges may appear on the trees; and during the following two years the whole of the expenses of a garden will as a general rule, be covered by the sale of the orange crops.

It is generally assumed that after the fourth year a garden becomes self-supporting; but it will require two years longer before a return in capital outlay can be expected. After the sixth year, however, a garden that has been well attended to will not only pay all expenses, but give a handsome return as well. The fortunate proprietor will now also have the further satisfaction of knowing that the marketable value of his property represents probably more than double the whole of his outlay. This will give an idea how profitable orange-growing in Jaffa really is, to those who can afford to wait a few years for a return on capital. To the native of Jaffa only one form of investment has a charm—the height of his ambition is to own a 'Biarrah,' the technical term for an orange-garden; unfortunately for him, however, he as frequently as not launches upon the enterprise without having sufficient capital to see it through successfully, with the result that he is compelled to borrow money at a ruinous rate of interest in order to meet his current expenses, and finally has to part with his property before he has seen any of its fruit. This explains why most of the garden property is in the hands of the money-lending class, who have had very little trouble in growing the trees.

THE FUTURE OF COCONUTS.

(Contributed.)

Once the garden is in full bearing, the proprietor, apart from an occasional visit of supervision, has little to do beyond selling his crop of oranges, paying the expenses, and pocketing the balance.

The gardener in charge receives a fixed wage of from two to two pounds ten shillings per measure only as long as the trees do not bear; once they are in full bearing he is no longer paid by a fixed wage, but receives a share of the produce, generally one-twelfth to one-tenth of the crop. It is also understood that the gardener's wife and family, who live on the premises, assist in the garden-work without extra remuneration, hence the size of his gardener's family is a matter of some consideration with the owner. This system of making the gardener a partner in the produce of the garden works very well, as he thereby acquires an interest in the general up-keep of the property.

It is difficult to calculate the exact cost of laying down a garden. The price of the land varies of course according to position and quality; then the depth of the water below the surface and consequent cost of sinking the well cannot be estimated to a nicety. As a general rule, however, a garden containing six thousand young trees will cost from eleven hundred to twelve hundred pounds to lay down complete, with livestock. To this sum will have to be added five years' expenditure (during which period the garden is assumed to be unproductive) at the rate of one hundred and twenty pounds per annum, making six hundred pounds. We have therefore a total of eighteen hundred pounds, representing the capital outlay on the garden up to the time that the trees are in full bearing. From now onwards the crop of oranges will have an annual value of from four hundred to five hundred pounds; and this will leave the proprietor, after deducting all expenses for wages, feed of live-stock, taxes, repairs, &c.; a clear revenue of ten to fifteen per cent. on his total capital outlay of eighteen hundred pounds.

The risks which the Jaffa orange-grower runs, as compared with those which the grower in Florida has to face, are infinitesimal. The storms that visit the Syrian coast, although of frequent occurrence during the winter months, are not of such force as to damage the trees; in fact it is remarkable how very small is the proportion of ripe fruit even which falls to the ground after a storm. This is no doubt due to the fact that the Jaffa orange tree is not allowed to grow larger than a good-sized shrub; and as the trees are placed only four yards apart they afford each other very considerable protection from the force of the wind. The cactus shrubs also, forming the hedge of the garden, grow very thick and high, and give additional protection from the storms. Blizzards and frosts, which have proved so ruinous in Florida, are quite unknown in Jaffa.

Owing to the good keeping qualities of Jaffa oranges, which enables them to be shipped to distant parts, there is always a brisk demand for them, and the grower has hitherto had very little difficulty in disposing of his crops at good prices. If not exorbitant in his demands, he can almost invariably sell his fruit for a lump sum while the fruit is still green, and before the winter, with its risks of hail, &c., has set in. The shipper who purchases the fruit in this way takes over the whole of the risk of any damage that may happen to it, and he cuts the oranges from the trees whenever it suits him to do so; the contract only stipulating that the garden is to be cleared by the middle of March, as the proprietor likes to see his trees free of fruit before the new blossoms appear.

The whole of the crop of Jaffa oranges does not at the present time exceed three hundred thousand boxes of about one hundred and sixty oranges each, which is a mere trifle compared with Spanish or American crops, and about four-fifths of this quantity is at present shipped to England.

The orange-growing industry is almost entirely in the hands of natives; a few of the newer gardens are, however, owned by Germans and Frenchmen.—*Chambers's Journal.*

In view of the interest that has lately been shewn by European planters and capitalists in the coconut industry of Ceylon, it may be of interest to state that a new impetus has been given to extend the industry by finding a more extensive outlet for the produce to Russia. This has been suggested by the presence of the new Russian firms in Colombo, and, there having been much talk on the subject, there now seems every possibility of an extensive trade with that country being worked up before long. Curiously enough, so far as we know, the demand in this direction is only for copperah, and no steamer of the Russian Volunteer Fleet has left our Port for Odessa without a large cargo of that commodity. The demand is increasing, and it will increase with the advancement and progress of the country of the Czar. Besides our shipments direct to Odessa, the London, Hamburg, and Antwerp markets also provide an outlet in this line. The greatest demand for our produce, however, remains, with Russia, but it seems it does not pay her merchants to import coconut oil, owing to the heavy duty imposed. They receive, therefore, the copperah and extract the oil themselves, and also turn the poonac into good use. The demand for copperah is increasing, and it is of interest to inquire whether in this respect, Ceylon can be competed with in the market by any other country. We apprehend no fear on this score. The nearest coconut-producing country to us is the Malabar Coast, with Cochin as its centre, and then we have, on the other side, the Straits. The output from those countries, comparatively speaking, amounts to very little, and we can lead the market yet, without any fear of competition from them, owing to our shipping facilities at Colombo. There are, in the far distant Pacific, the South Sea Islands, which produce an immense quantity of coconuts, and it has been said that the nuts produced in those Islands are far superior to ours in size. Sydney and some few other Colonial Ports, however, are the principal consumers of the produce from those Islands, and with that demand it does not pay to find farther markets, so we have no fear of the South Sea Islanders coming into the market to compete, unless they wait for the Siberian Railway, and even then it is hardly possible that anything much may come out of such competition. We, therefore, see that we can hold our own in the coconut industry until African produce is matured, and then it is doubtful whether new fields will come to anything in this line. Ceylon will always take the lead in the market for the industry, and investments in coconut lands is therefore no mere speculation, but one of sure and steady profitable returns. Glancing over the Administration Report of that most important Province of our Island—the North-Western—we say most important—because it has the finest coconut estates in the Island—we are pleased to note that new areas have been opened up during last year and planted with coconuts, and there yet remain thousands of acres of land in that Province to go under this cultivation. The Government Agent of that Province writes in his Administration Report for 1897:—“The increase in the receipts from land sales is satisfactory. There is a very large area of land still available if there were surveyors to survey it. Meanwhile, the demand for land is very great in this Province.” Our Government however, it must be pointed out, is very short-sighted in its policy in considering the question of the future prospects of the coconut industry and the “sales of land by villagers.” The policy has decidedly a tendency to mar the progress of the country. There are hundreds and thousands of acres of land belonging to the villagers, which can be profitably converted into paying coconut estates. They are just now a burden to the villagers, for he cannot properly cultivate them, because he has not the means, and they are an eye-

sore to the country, owing to their neglected condition. The villager is threatened by the Government label "sales of land by villagers" and other consequences, and he is thus handicapped and so is the capitalist. We must repeat, in the interests of the country, that the policy adopted by Government is not only suicidal, but it is also a serious blow to the march of progress and civilization in the country. A tour round the North-Western Province and among the coconut estates there will amply repay the intending investor. He will note what land there is available for opening up, both from the Crown and natives, and what planted land there is to be had. A year ago, the value of land all round was not the same as the price asked for now. This is not to be wondered at, for the Province is making wonderful progress, though slowly, since the railway line was opened. Since labour and capital have been brought in to ouce a feverish and dreaded Province, and with the increase of the chief industry, the trade is daily increasing, and price of land is looking up. When Government finally decides to throw up its inane policy of restricting the sales of land by villages to capitalists, and thus assist both the villager and capitalist, its Customs returns from shipments of copperah to Europe will alone be a principal revenue to the island—not to speak of nuts, oil, or "dissicated."—Local "Times."

THE USE OF ARTIFICIAL MANURES.

IS IT A CONTRADICTION, OR WHAT?—In the *Journal of the Royal Horticultural Society*, vol. xxi., Part I., August, 1897, p. 37, in a paper on "Artificial Manures," by Mr. J. J. Willis, I find the following:—"How much more useful these manures (stable and farmyard manures) could be rendered by an admixture with suitable artificial fertilisers."

And on p. 42: "Artificial manures, therefore, are not recommended to take the place of farmyard or stable manure, but to be used in conjunction with them."

On the other hand, in the *Journal of the Royal Agricultural Society of England*, third series, vol. viii., Part III., No. 31, Sept. 30, 1897, now before me, I find the following in a paper on "Recent Experiments on Denitrification." On p. 477: "Notwithstanding the high position that artificial manures now take in the estimation of farmers in all parts of the world, it cannot be said that they have done anything to displace the use of farmyard manure, which must still be regarded as our most general and important fertiliser. All the farmyard manure produced in this country is still applied to the land, and artificials find their legitimate place as sources of plant-food on areas that the available supply of home-made manure is insufficient to dress."

But observe what follows on p. 480: "By a series of experiments and calculations, Mæcker showed that from 12 to 47 per cent. of the nitrogen in nitrate of soda was dissipated through contact with the various forms of dung in the soil, and the loss was greatest when the largest quantity of dung was used."

And on p. 482: "It now becomes of interest to ascertain what becomes of the nitrogen that loses its nitric form in the presence of dung." . . . "In every case it has been found that the nitrogen has been liberated in the elementary form."

P. 484: "There is thus no escaping from the conclusion that nitrates, whether naturally present in manure, or the soil, or when added in so-called artificial manures, are rapidly destroyed by organisms (bacteria) which are very abundant in dung, and are also present, though to a much less extent in soil."

Further on p. 481: "It was found that the crop was least, and the loss of nitrogen greatest, in the mixture that contained most straw." In other words, if you use nitrates in "conjunction" with dung, you may as well save the money spent in artificial nitrates, and leave it in the savings-bank, for, if all that has been written be true, you will obtain no advantage from the use of the additional artificial manure!

What is called "long manure," with plenty of straw in it, seems to be the most wasteful, for the additional straw is prolific in denitrifying bacteria, which dissipate the nitrogen in its elementary form, and so render the nitrate valueless.

However, on p. 485, this is stated: "Evidently, therefore the denitrifying power of the dung is lost to a large extent by contact with the soil for two or three months."

"Wagner carried out a series of experiments, which also go to show that the denitrifying bacteria are much less energetic in old than in new dung."

In England it has been found that no appreciable increase of crop resulted when artificial manures, such as nitrates, were used with dung. And now German experiments appear to have solved this riddle. They seem to show that nitrogen is dissipated in its elementary form; that is, it is lost or wasted by contact with dung; and fresh dung, when used in "conjunction" with nitrates, is far more wasteful than well-rotted dung, 'for the reason that the denitrifying organisms so abundant in the dung instantly attack to the nitrate of soda (or other nitrate, and also sulphate of ammonia, &c.) and dissipate the nitrogen in the elementary form.'

I suppose we may infer that it would require the nodulosity of leguminosæ to capture this elementary nitrogen again, and make it available for the growth of plants. The curious thing is, that purely phosphatic and potassic manures also fail to produce satisfactory results when used with dung; "but Wagner's experiments show that the negative results obtained, when mineral-manures are added to dung, are intimately associated with denitrification."

The conclusion to be drawn from all these experiments, if they are reliable, is first, that dung-heaps should be frequently turned, "so as to induce rapid fermentation, oxidation, and a high temperature" before using them; and second not to use dung in "conjunction" with artificial manures, and especially with nitrates.

There can be no doubt whatever that farmyard and stable manures are very valuable and important fertilisers. The whole agricultural history of man, all the world over, from the most primitive times, furnishes evidence of this. The safest plan would, however, seem to be to use home-made and well-rotted manures one year without artificial manures, and only artificial manures the next year.

Artificial manures are trumpeted everywhere as the saviours of agriculturists and horticulturists, and no doubt if the soil wants these ingredients, and if the crops to be grown require them, they must be of advantage; the question, however, remains as to how and when these artificial manures should be used.

Farm and stable manures have for ages given satisfactory results, under certain circumstances, that it would be a hopeless attempt to try and persuade practical growers not to use them; the problem is, how and when to use them, when the soil needs some ingredients which these home-made manures do not contain.

This subject is so important, from not only an individual but also a national point of view, that the more it is ventilated, the more is the likelihood that we shall get at the bottom of the conditions needed for scientific agriculture and horticulture. E. BONAVIA, M.D.—*Gardeners' Chronicle*.

PALMS OF MATTOGROSSO.—The Director of the Botanic Gardens at Rio Janeiro, Senr. J. Barbosa Rodrigues, has lately published a monograph of the Palms of this district, accompanied by twenty-seven lithographic illustrations. The species and varieties number nearly sixty. Among other things, we note a synopsis of the species of *Cocos* native to Brazil, and therein, under the section *Glaziova*, is included the *Cocos Weddelliana*, Wendland, which has been the subject of enquiry lately. This Palm is stated to be known at Rio by the vernacular name of *Iká*. —*Gardeners' Chronicle*.

SCIENTIFIC AGRICULTURE AND THE PLANTING INDUSTRY.

The three long letters dealing chiefly with this topic which we publish elsewhere may be regarded as "dry and uninteresting" by the majority of our readers. But to all the intelligent men concerned about the future welfare of our tea culture and the prosperity of the Colony—the two largely stand or fall together—we commend their careful perusal and thoughtful consideration under present circumstances. To the young or rising planter who wishes to master his profession, and to do the very best he can for his employers and the plantation entrusted to his care, such reading is of vast importance. Every day more and more clearly shows that there is a vast deal yet to be gained by acquiring knowledge from scientific and practical men, by personal observation, and above all by actual experiments, in regard to the tea plant in different soils, and not less as to the best mode of plucking and the details of manufacture. The third is not touched on today; the second is, to some extent treated by "T. K." who is an upcountry planter; while the first occupies the attention of all three writers, and it is something to bring together, such diverse experiences and opinions in the way we do today. Recurring to field-work, we have had many opinions expressed, similar to those of "T. K.", as to the great value of the services of young "sinna durais" (of the right stamp with full interest in their work) in the close supervision of field-work, but especially of "plucking." Conductors or kangamies who can be trusted to do as well, are very few and far between; and the higher salary is easily saved by the better results from the work of approved field assistants of the type described.

Now, to turn to the topic more immediately under discussion, our correspondent "B" opens with an assertion which was long ago in Western countries accepted as a truism when put into a briefer, pithier shape:—"the civilization of a country may be gauged by its consumption of sulphuric acid." There can be no doubt that we are face to face with an era of "scientific agriculture," that the planter who is to succeed and prosper, must study the subject theoretically and practically and seek the aid of the Agricultural Chemist as well as of the reliable importer and manufacturer of Manures. We cordially endorse the opinions of our correspondents that greater facilities are required, and we go further in saying that it is a disgrace in a purely Agricultural Colony like Ceylon, that the Government had not long ago—quite thirty years back—appointed an Agricultural Analyst. The value of the accumulation of analyses coupled with corresponding experiments in official Gardens or on Agricultural School plots that would now be available, may be judged from what Mr. Cochran has published even as a private individual in his "Ceylon Manual of Analyses," and from his useful writings for the benefit of planters and others, not the least being his contribution elsewhere today.

What is required is that such work should be rendered continuous and systematized, but this is impossible for any private individual; while the Ceylon authorities—unlike those of Java, where even the Service Cadets have to pass an examination in Agricultural knowledge—neglect to do justice either to their native or European agriculturists, by establishing an Agricultural Department and School with a staff of scientists (many of them already available) after the pattern set in the Buitenzorg institution, which has done such immense service for the Planting and Agriculture of Netherlands India.

To consider more particularly, the teaching of our letters, very striking surely is the statement repeated by Mr. Cochran that 50 lb. of nitrogen given in an available form is of more moment to a growing crop than are 17,000 lb. of organic nitrogen lying inert in each acre of land. Surely the planter who reads this needs no further evidence of the importance of "scientific agriculture"; and yet one of the means of rendering that which is inert, active and beneficial, requires no aid from the scientist or any scientific preparation. We refer to the digging and loosening—the aerating—of the soil about the tea plants. Not nearly enough in this direction is attempted in Ceylon, and although the benefit is only temporary, if supplemented by what the Agricultural Chemist, after analysis, informs him is most wanted to utilize the latent resources of his soil, the planter may feel assured he is doing justice to his fields and should reap success. Based on the work of analyst and the rules of scientific agriculture are the manures prepared and supplied, either as principals and agents, by Messrs. Whittall & Co., Freudenberg & Co., Baker & Hall, Eastern Produce and Estates Co., Colombo Commercial Co., and Mr. Baur, among other Colombo Firms, going by the advertisements before us. The planters have therefore, no want of choice in obtaining what they require; and of course not a few having already demonstrated to their own satisfaction, perhaps long ago, the value of certain manures obtained from their Agents, prefer to go on with the same. But even such conservatives should reflect that a small experiment on an acre or two, costs very little, and that the result may be, both economy in first outlay and improved crops. In any case, let the "practical man" who perhaps, scorns to be indebted to new-fangled notions at his time of life, just read the closing illustration with which Mr. Cochran winds up his letter, and then ask himself, for the proprietor of the estate in question, whether the facts related were not worth learning at the hands of the Analytical Chemist.

PRICES IN COLOMBO AND LONDON COMPARED.

Some people may have thought that we rather exaggerated things when we stated the other day that Colombo prices for tea were 1½d higher than London prices.

In order to gauge the difference in value between the Colombo and London Markets, we have taken out from the London catalogues of March 15th the sale prices of a few marks, and the following is our comparison of these with teas sold in Colombo on the 20th ultimo. In offering this comparison we must not omit to point out

that there may have been a difference in quality. This, of course, we are unable to express an opinion upon:—

LONDON CATALOGUES. COLOMBO CATALOGUES.

	March 15th.		April 20th.	
	sold.	d.	cts.	about.
Ganapalla	18 c B.O.P.	6½	18 c B.O.P.	33 = 6½
	21 c O.P.	7		
	25 c O.P.	6½	18 c O.P.	41 „ 8¼
	37 c P.	5½	50 c P.	32 „ 6½
Lonach	21½ c B.P.	6½	19½ c B.P.	44 „ 6½
	42 c B.P.	7½		
Kirklees	18 c O.P.	7	30 c O.P.	46 „ 9
	14 c P.S.	5	36 c P.S.	33 „ 6½
Carfax	32 c O.P.	6½	26 c O.P.	41 „ 8½
Hatdowa	22 c B.P.S.	6	35 c B.P.	31 „ 6½
Kew	27 c P.	7	33 c P.	38 „ 7½
Naseby	14½ c P.	10	19½ c O.P.	70 „ 11
Harrington	20 c O.P.	7½	19 c O.P.	48 „ 9½
Gingranoya	28 c P.	5½	16 c P.	36 „ 7½
Anningkande	73½ c B.P.	7	26 c B.P.S.	38 „ 7½

Now though it cannot be said that the above table supplies a complete justification for our remarks it is as near as we can get. It must be remembered that the London market was decidedly higher on March 15th than it was last week, so there is no injustice in comparing prices for the same marks obtained in London on March 15th with those realized by them in Colombo at the last sale. It will be seen that there is a difference in favour of Colombo of from ¼d to 2d per lb.—Local "Times."

GOVERNMENT GARDENS AT THE STRAITS.

Extracts from Report on Government Gardens for the year 1897, by the Superintendent of Government Gardens.

LARUT HILL STATION.—Revenue—The revenue collected for hill produce amounted to \$1,353.20.

CATTLE HERD.—No cattle were sold during the year, but I propose selling some of the calves at an early date. The cows, with their calves, are kept at Maxwell's Hill, stronger calves—pending a sale—and pack-bulls, at the Tea Gardens. At the latter place an outbreak of foot and mouth disease of a mild type occurred in August, through the bulls visiting Taiping. The shed was at once disinfected, and a dressing supplied by the Veterinary Surgeon cured the infected animals in three weeks. The herd at Maxwell's Hill has kept healthy, but a change of blood is urgently needed, as the calves, through being too closely bred, are very weedy; and I am making enquiries as to the probable cost of importing a young Australian bull to replace the present Indian one. All the best cows are mixed breed.

TAIPIING GARDEN.—This work was taken over by me, as well as collecting revenue for hill produce formerly collected by the Public Works Department, some months after my arrival. A nursery under formation was completed early in the year, and is now stocked with ornamental shrubs, shade trees and palms, mostly obtained from the Botanic Gardens at Penang and Singapore. Shade trees have been planted round the lake road, and since the arrival of Mr. Venning as Secretary to Government convict labour has been secured for clearing and remodelling the islands, under his direction.

KUALA KANGSAR GARDEN.—Revenue:—The revenue earned amounted to \$1,665.40, as follows:—Fruit, \$836.50; Milk and Sale of Cattle, \$449.79; Coconuts, Fruits and Plants, \$135.01; Fruit Trees and Seeds, \$244.10. Total, \$1,665.40. The garden has been well maintained, and an extension of nine acres cleared and planted with nutmegs, lemons and coconuts. Excellent crops of lemons and pomoloes were ob-

tained. The latter crop was secured against the ravages of the pomoloe moth by covering the fruits with thin drill bags, which proved fairly successful. Much time has been occupied in nursery work to meet the demand for cocount and fruit trees.

PARA RUBBER (*Hevea brasiliensis*). Many trees have been tapped, and a report on the work submitted. The rubber obtained is not yet sufficiently smoked for sending home, but samples have been valued in Mining Lane at 2s 8d and 3s per pound, and considered equal to Brazilian produced rubber, and also worth 1s per pound more than that usually sent home from the Straits. There has been a large demand for seeds, and about 35,000 have been supplied. How far this industry is deserving attention may be inferred from the following moderate estimate:—(Planted 14 feet + 14 feet = 225 trees to the acre.)

Age, years.	Yield per Tree.	Yield per acre, 225 trees.		Gross value per acre, estimate at 2s per pound.	
		Onnces.	Pounds.	£	s.
6	10	140½		14	10
7	18	250		25	00
8	26	365		36	15
9	34	478		47	13
10	42	590½		59	01

The importance of close planting is not generally realised. Planted at 14 feet by 14 feet, against 25 feet by 25 feet would possibly result in a difference of one year in six in favour of close planting. I am of opinion that planted 14 feet by 14 feet trees could be tapped in the fifth year, if not earlier. Para rubber is a remarkably adaptable tree, growing in swampy land or dry high ground without, so far as I have tested, any difference in the yield of rubber.

RAMBONG (*Ficus elastica*).—There are three moderate sized trees of this species in the garden which I propose to tap early next year, and also propagate as largely as possible. The rubber is not priced so high as para, and the tree is somewhat capricious under cultivation.

CENTRAL AMERICA RUBBER (*Castilloa elastica*).—Only one example of this tree is growing in the garden, and this is in very poor condition. It is not so much a question of soil, site or climate as is usually supposed, but the attacks of various borers, followed by ants, which proves so detrimental to many imported trees, e.g., mahogany.

NUTMEGS.—In Malay gardens along the Perak river nutmegs thrive exceedingly well, but are always too shaded, and in consequence only scanty crops are obtained. The price is nearly always good, and nutmegs might form an important cottage industry if Malays could be induced to plant more extensively.

CHIGOR GALAH PEPPER GARDEN.—This garden was taken over by Government about eighteen months ago, and I visited it during my monthly visit to Kuala Kangsar. Owing to its favourable situation, to keep the garden clean from weeds is not a light task, but good progress has been made, and much *lallang* got rid of. Most of the vines are long past full grown, and urgently need manure, which is being applied as fast as possible. The crop amounted to 63 bags (dry pepper) 14 black and 49 white, which I prepared myself, and which sold in London for 6 3-8th d per pound, almost a record price for this class of pepper. Although situated high from the river most of the garden was covered by the flood to a depth of five feet, but the damage done was trifling.

EXPERIMENTAL WORK AND GARDENS.—I have mentioned what experimental work has been done, and I would call attention to the importance of developing and utilizing the Kuala Kangsar garden to a much larger extent in the interests of State agriculture. This garden could be made a really interesting one for

the planter, without in any way affecting its picturesque appearance, and much experimental work could be carried on.—R. DERRY, Supt. Govt. Garden.

INTEREST ON ADVANCES TO KANGANIES AND KELANI VALLEY COOLY FEDERATION.

At the request of the Chairman, Mr. MACLURE brought up the following resolution at the meeting of the Maskeliya Planters' Association the other day:—"That in the opinion of this Association the time has come when interest should be charged on all advances to kanganies other than advances for the purpose of procuring labour from India, and that the matter be recommended to the consideration of the labour federation."

Mr. TAIT seconded.

Mr. MACLURE said that he thought every planter would admit that the advance system which used to work well enough in the coffee days had of late years been much abused, and it was now a source of anxiety and worry to them all, and possible loss too in the future. The question was, did they do everything they could to discourage its abuse? It seemed to him that at present they rather encouraged it by giving out large advances to kanganies free of interest which the latter lent out at a heavy rate of interest. Now he would ask them to put themselves in the kangany's place; if money were placed at their disposal and they could lend out that money at a good rate of interest would they not get as much as they possibly could? Mr. MacLure said he would say the kangany would be a fool if he did not scheme and worry to get as much as he could on these terms, and that was just what he was doing as they (the planters) all knew to their cost. The system of advancing large sums of money to kanganies free of interest was opposed to all business principles, and it lent itself to abuse. For instance he would ask what there was to hinder a kangany when he succeeded by false pretences in extracting R1,000 out of his Dorai from going to the neighbouring estate or even to the caddies and lending that R1,000 at, say 10 per cent, interest to another estate kangani or to a bazaar man, and thereby carving a nice little annual income of R100 at the expense of the estate. Mr. MacLure said he believed if the truth were known the uses to which their advances had been put it would astonish them (the planters.) Continuing he said the profit on rice and interest on 3 to 4 months' pay due to the coolies used to be set off against interest on advances. He submitted there had not been much profit on rice lately and now-a-days most estates paid monthly, and even if the price of rice should go down he thought they ought, after recovering former losses, rather to let the cooly have it almost at cost price. By making a profit and considering it a set off against interest on advances they took from the cooly and gave to the kangany; now if anything he thought they ought rather to take from the kangany. For some years back the kangany had been slowly and steadily adding to his pay. In many cases the head money had been increased, names were given for looking after work which was never done before, and he demanded and got R30, R40 and R50 a head for his coolies when, before, he was content with R5 or R10 a head. The result was it had been made such a paying thing that the crowning ambition of every cooly was to be a kangany, and there was a consequent competition among the kanganies for coolies and to that competition among the kanganies was due the increased advances (far more than to competition among Dorais.) The kangany was continually scheming and intriguing to increase his connection whether the estate wanted coolies or not. Mr. MacLure went on to say that some planters were of the opinion that what they wanted was a greater supply of labour, and that things would en right themselves—that with a more plentiful supply they should be in a position to dictate. The

speaker asked how it could be said they were short of labour, and how could they expect more coolies to flock in from the Coast when for 8 or 9 months of the year one heard of 5 to 4 and even 3 days' work in the week. It was only for a few months during the rush that they could do all with some more coolies. Those of them who could recall the coffee days would remember that they had the same difficulties then in crop time. Crop often drop off the trees for want of labour to pick it, and yet they never heard of such enormous advances in those days. The worst of it was that it was teaching the cooly reckless and extravagant habits, and Mr. MacLure said he thought, therefore, it was their duty by every means in their power to combine to keep down advances, and now was the time to do it—later on it might be difficult. Perhaps the fact of the kangani having to pay, say, 1 per cent. interest for advances, would make him think and hesitate before demanding a large sum; perhaps it would not; in any case the money would be earning interest for the estate. Mr. MacLure went on to say there were two ways by which kanganies could be charged interest on advance—one was by charging them interest on the total amount of advances, and at the end of the year crediting each interest in a sum representing, say, R20 per head for any *bona fide* coast coolies brought to the estate: the other way would be to charge interest on all advances exceeding R10 per head. Perhaps the latter would be the better and simpler plan. Mr. MacLure, in conclusion, said that for some years back they had meekly submitted to the exorbitant demands of the kangani, and it was now time they put their foot down. The speaker trusted that those who agreed with him in thinking that the kangani had had too much of his own way lately would have the courage of their convictions and vote in favor of the resolution. (Applause.)

On the vote being taken, it was found that only five had voted in favour of the motion the majority raising their hands against it.

The resolution was thus declared lost.

THE KELANI VALLEY COOLY FEDERATION.

The rule of the Kelani Valley Federation, with a covering letter, were next laid on the table, the letter showing that 83 out of 87 planters had agreed to abide by the rules.

TEA PLANTING IN SUMATRA:

MR. WM. BAKER OF BADULLA OPENING THE FIRST TEA ESTATE IN SUMATRA,

Mr. H. R. Porter of Messrs. Walker Sons & Co., Ltd., has returned from a trip to Sumatra. He left by the Austro-Lloyds ss. "Trieste" on the 29th March and returned by the P. & O. ss. "Chusan" on the 29th April. His visit was of a purely business nature, but a good deal of pleasure followed in its train, and Mr. Porter speaks in the highest terms of the manner in which he was received and the cordial hospitality which was extended to him by the Dutch planters who, he says, are very like the British Colonists in their jovial and courteous manner towards strangers. The Dutchmen in Sumatra as yet, know little or nothing about tea planting, their *forte* being the cultivation of the soothing weed although they may become gradually educated in taste and liking to the growth of the leaf which, when properly brewed, yields the cup which cheers but does not inebriate. His purpose was to visit the first tea estate opened up in Sumatra, belonging to the British Deli-Langkat Tobacco Company which owns over 35,000 acres planted with the fragrant weed, tobacco. The managers and superintendents of these tobacco plantations are, of course Dutch; but the labourers are either Javanese or Malay coolies who understand the work well and in

contradistinction to the system in force here, are individually under agreement to the planters. Labour, so far as he is aware, is plentiful, and the supervision is such as to prevent, to a large extent, desertion or crimping, it being necessary that everyone who goes off the estate, even on leave, should produce a pass to the Jagar or private policeman—and there are several of these employed by each estate—who accosts him, before he is allowed to go on his way. The management of the labour force is quite different from that which obtains in Ceylon, there being no such persons as kangannies, and the system seems to work very well. The estate which Mr. Porter visited is the first that has been opened in tea in Sumatra and is under the superintendence of Mr W. Baker, who is a former Ceylon planter and was stationed in the Badulla district before he went home and was appointed to his present billet in Sumatra. It is only two years since tea was planted on the estate which was formerly covered with Liberian coffee which has not been doing very well of recent years, and tea has been doing so well that orders have been issued to discontinue the cultivation of coffee and devote all attention to tea. The estate was opened in tea only about a couple of years ago and some of the bushes measure from 4 feet 6 inches to 5 feet height and $\frac{1}{2}$ to 2 inches in stem. The whole of the country thereabout, Mr. Porter says, seems to be of volcanic origin, there being a kind of vegetable deposit on the top of the lava. The elevation is not much above sea level, the estate in question being about 300 feet above the level of the sea, and the climate approaches very much to that of the Kelani Valley. Mr. Porter went from Colombo to Penang, thence to Sumatra in a local boat landing at Belawan from which he went to Medan, about 20 to 25 miles by rail and then rode to Diski, and from Diski travelled over 12 miles of tramway which brought him to within half a mile of the estate. What tea has been made, has been disposed of very well locally. The only machinery at present used is a roller and Mr. Porter's visit was to design a new factory with water-power and to arrange for a complete outfit to suit the estate which is about 350 acres in extent. This has not yet been all planted in tea but will be as soon as possible. Medan seems to be a very good place and has a fine big hotel which was opened about two months ago. The railway is worked by Dutch private enterprise and so far as could be judged, does very well. The principal officials are Dutch and the subordinates Javanese or Malays. The style of carriage is susceptible of improvement, the first class being only about equal to the second class carriage here. The carriages are open at the ends and the tickets are examined *en route*.

JACKSON'S IMPROVED 72 INCH VENETIAN DRYER.

This machine has recently been increased in size as compared with the old Venetian and Burra Venetian machines respectively. The drying area has been considerably increased, and the heating surface of the stove has also been proportionately increased, which will materially add to the economy in fuel consumption. The fan bearings have been improved and made dust-proof, and increased power has been given to the tray-tipping disc handles. An improved form of ventilator and cold air inlet has been provided, as

well as a new arrangement for the discharge gear, which is now fitted with index plate lever and bevel gearing, so as to bring full control of the machine within reach of the attendant on the feed platform.

The small size Venetian is also being redesigned, and will be brought thoroughly up to date in every detail, the same as the 72in machine.—*Home and Colonial Mail*, April 15.

CEYLON TEA PLANTATIONS COMPANY, LIMITED.

DIRECTORS:—Messrs. H. K. Rutherford, Chairman and Managing Director; Henry Todd, David Reid, G. A. Talbot.

SECRETARY:—Sir Wm. Johnston, Bart.
MANAGER IN CEYLON:—Mr. H. V. Masefield.
OFFICE:—20, Eastcheap, London, E.C.

Report of the Directors to be submitted at the Eleventh Annual Ordinary General Meeting of Shareholders, to be held at the Office of the Company, on Wednesday, 27th April.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending 31st December, 1897, duly audited.

£ s. d. £ s. d.

The net amount at credit of profit and loss account, including balance brought forward at 31st December, 1896, and after providing for General expenses, Directors' fees, income tax, &c. is 43,715 7 1

An interim Dividend of 7 per cent. on the ordinary shares was paid 28th October, 1897, amounting to .. 11,716 12 0

It is proposed to pay a final dividend of 8 per cent. on the ordinary shares (making 15 per cent. in all, free of income tax) which will absorb .. 13,390 8 0

Dividends on the 7 per cent. preference shares were paid for 1897 (less income tax) amounting to .. 5,486 16 4

It is proposed to add to Reserve Fund .. 5,000 0 0

It is proposed to write off for Depreciation .. 5,000 0 0

And to carry forward to next year a balance of .. 3,121 10 9

£43,715 7 1

Notwithstanding the past year has been an unfavourable one generally for the Tea industry of Ceylon, as compared with the previous years, your Directors are pleased to be in a position to recommend the payment of the usual dividend of 15 per cent. on the ordinary shares, this being the eleventh consecutive year of a like dividend.

It is proposed to write off for depreciation, the sum of £5,000, and to add £5,000 to the Reserve Fund, which will then amount to £90,000, and to carry forward £3,121 10s. 9d.

Lower prices for Tea, a higher rate of Rupee exchange, and loss in supplying rice to the coolies, consequent on the Indian famine, are the causes of the fall in the profits for the year.

The yield of Tea was 495 lb. per acre over a plucking area of 8,067 acres, as against 470 lb. per acre the previous year.

The crop for 1897 was as under:—

Estate Tea.	Tea Manufactured		Total.
	Bought leaf lbs.	others lbs.	
4,000,516	503,840	1,019,789	5,524,145

The gross price realised for the Company's teas, sold in London was 7s 8d as against 8s 14d per lb. in 1896.

The average rate of exchange was 1s. 3 13/32d compared with 1s. 2 37/64d the previous year.

The produce from the coconut properties is steadily increasing, 1,209,980 nnts were harvested, as against 975,570 the previous year, and the out-turn from our Estate mills was 3,800 cwts. copra, and 4,540 cwts. Fibre.

In June last the Hunnpitiya Mills; Negombo, were purchased for £3,000 for the manufacture of desiccated coconut and oil.

Appended to this report will be found a statement showing the annual position of the Company for the last eleven years.

The Directors again desire to express their appreciation of the zeal and ability displayed by the Officers of the Company in Ceylon and London. Under the Articles of Association, Mr. Henry Todd vacates his seat on the Board, but being eligible offers for himself for re-election. The Auditors, Messrs. Harper Brothers, Chartered Accountants also retired from office and offer themselves for re-election.

PRODUCE AND PLANTING.

PLANTERS AND STATE AID.—When discussing the unfortunate position of West India sugar planters we have referred to the argument used against them in comparing their position with that of Ceylon planters some twenty years ago. When coffee failed in Ceylon the planters turned their attention to other products, and very successfully too. After the reading of a paper on the West Indies at the Colonial Institute last month, one of the speakers referred to this argument and endeavoured to show that there was no analogy between the respective positions. Colonel Alexander Mann, C.M.G., said on the occasion referred to:—"People at home say that if the West Indian planters cannot make sugar pay, they should follow the example of Ceylon and try something else; and that is a sentiment which, especially in the north of Scotland, appeals to many, because people from that quarter own and work a great deal of the land in Ceylon. It is well known, I presume, to nearly everyone here that when the staple product of that eastern island failed, its proprietors turned to tea. But the case is an entirely different case to the sugar question in the West Indies. In the case of Ceylon it was not the market that failed, but the article grown; nature simply refused to yield her fruits in due season. In the case of the West Indies it was the market that failed, and this through artificial causes." We doubt very much if those to whom this argument is intended to apply will regard it as a forcible one. There may be some subtle distinction between the failure of a crop and the failure of a market for that crop, but the result is practically the same. On the one hand the blame is attributed to nature; on the other, the consumer is the culprit. But the unfortunate planter in both instances is the sufferer, and we cannot see that the West Indian sugar grower is in a stronger position to claim State aid than the Ceylon coffee planter would have been twenty years ago. It may be said in reply, "But the coffee planter did not ask aid." No, but it is easy to imagine what would have happened had he done so. With every sympathy for the unfortunate sugar planter, we are unable to see why, if he receives State aid, similar assistance should be denied to other Colonial agriculturists at some future time. Supposing China were to swamp the tea market under labour or other conditions not imaginable at the moment, would not the position of British, British Colonial, or Indian tea planters be much the same as that of the sugar planters now? Possibly we may have a system of bounties on tea in Japan and China one day, and while we do not object to the aid proposed in the case of the West Indies, we think the Government, by granting it, will have established a precedent which subsequent Governments may one day be called upon to defend. The difference where "nature refuses to yield her fruits in due season," to use the language of Colonel Mann,

and where nature's fruits cannot be cultivated upon profitable lines, will have to be clearly defined.

A CASE IN POINT.—Take the currency question. Planters of all kinds of produce in India and Ceylon are at the present moment handicapped by the artificial rise in the rupee, the result of Government action. They can grow produce under ordinary conditions, and find a profitable market for it, but just now their profits are cut down and their prosperity threatened by the action of the Government which affects them, or will, if it be persisted in, much as the bounty on beet sugar adversely affects the West Indian sugarcane grower. In the one instance foreign Governments are to blame and the British Government proposes to come to the rescue. In the other case the Indian Government, with the approval of the home Government, is at the bottom of the business. No wonder planters in India and Ceylon are loud in their denunciation of the present financial policy in India, and they cannot be blamed if they fail to see the logic of a situation which proposes to support a threatened colonial industry in one case and handicaps it severely in the other

JAPANESE TEA AND THE RUSSIAN MARKET.—The St. Petersburg *Viedomosti* reports that a regular communication by steamers will be established next year between the ports of the Black Sea and Yokohama. The chief aim of the promoters of this service will be the export of Russian petroleum to Japan, and in exchange for the commodity raw iron and camphor are to be brought back. The Japanese Ministry of Trade has lately sent one of its officials to Russia with a view to finding openings for Japanese goods in that country. The producers of tea in Japan intend to introduce their tea into Russia, and to that end the first depots for the sale of Japanese tea in Russia will shortly be opened in Moscow, Warsaw, and Odessa. An important company has been formed in Japan to carry out the project.—*H. and C. Mail*, April 15.

THE TEA INDUSTRY IN THE KALUTARA DISTRICT.—This is how Mr. Brodhurst reports for 1897:—

I am indebted to the Chairman of the Kalutara Planters' Association for some interesting statistics showing the progress of the tea industry. The number of estates in the Association is now thirty-one. This does not however include all the estates which are scheduled under the Medical Aid Ordinance, and most of which employ immigrant Tamil labour, the total number being forty-four. The acreage under tea for the 31 estates mentioned is given as 12,000 acres. The returns prepared for the Blue Book show a total of 17,913 acres in tea for the whole district, viz.:

	Acres.
The totamunes ..	550
Rayigam korale ..	4,336
Pasdun korale west ..	9,703
Pasdun korale east ..	3,324

Total .. 17,913

This gives an excess of 5,913 acres over the Association figures. It is probable that a good deal of this acreage is not yet in bearing, but in forming an estimate of crop some additions would have to be made to the official figures. The number of immigrant labourers employed is given as 8,500, showing a large increase since the census was taken in 1891, when the number was put down at 4,190. The approximate amount paid to Sinhalese labourers is estimated at R400,000. It is the distribution of this large sum among the natives, more especially in the Pasdun korales, which chiefly accounts for the marked improvement in the physical condition of the people of those divisions. There can be little doubt that a considerable proportion of the grain imported at Beruwala goes to the Pasdun korales, and chiefly to the Iddagoda pattu, in which the estates are mostly situated.

EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

DIRECTORS.—Messrs. Ralph A. Cameron, Managing Director; Norman W. Grieve, C. J. Lindsay Nicholson, David Reid, Christopher B. Smith, Edward Wahab. Douglas R. Smith, Secretary.

REPORT.—To be presented at the Eleventh Ordinary General Meeting, to be held at Winchester House, Old Broad Street, on the 29th April.

The Directors submit Report and Balance Sheet for the year ending 31st December, 1897.

The profit for the year is £37,941 18s. 11d., which, added, to £11,739 1s. 4d., balance from last account, amounts to £49,681 0 3

From this has to be deducted:—

Interest on Debentures. . . £ 4,950 0 0	
Debenturers for £7,500 drawn and paid off, with bonus of 5 per cent, on 31st Dec. 1897	7,875 0 0
Interim Dividend of 2½ per cent on Preferred and Ordinary Share Capital, paid 4th November, 1897	7,497 4 0
	20,322 4 0

leaving a balance of 29,358 16 3

which it is proposed to appropriate as follows:—

Final Dividend on the Preferred Shares of 2½ per cent., making 5 per cent. for the year, and on the Ordinary Shares of 4½ per cent., making 7 per cent for the year	13,479 18 0
To Reserve Fund	5,000 0 0
Balance to be carried forward as provision for retirement of Debentures in the current year	10,878 18 3
	£29,358 16 3

A higher rate of exchange coupled with a lower price of tea, and enhanced cost of rice—the result of the Indian Famine—have adversely affected profits in the past year.

As shown in the schedule below, the Company on 31st December last had 10,650 acres under Tea cultivation, of which 9,565 were over four years old.

The Koladenia Estate, a small outlying property, was sold as from 1st January, 1897, for £2,644 8s. 8d., and the amount has been invested in the names of the Trustees for the Debenture holders.

The yield of Tea in 1897 was 3,635,000 lb., being somewhat short of the estimate, and the average gross sale price was 7.06d. The estimated yield for 1898 is 3,850,000 lb. In accordance with the Articles of Association, two of the Directors, Mr. Norman W. Grieve and Mr. David Reid, retire from office, and being eligible, offer themselves for re-election. The retiring Auditors, Messrs. Welton, Jones & Co., offer themselves for re-election.

SCHEDULE OF THE COMPANY'S ESTATES AT 31st DECEMBER, 1897.

Arapolakande, Asgeria and Bulatwatte, Colonna, Condegalla, Doombagastalawa, Dromoland, Hope, Inurugalla and Berrewella, Kirrimittia, Kumaradola, Kumbukkan, Labookellie, Meddecoombra, Norwood Rothschild, Sogamma, Vellai Oya and Dandukelawa and Wevekellie.

Under Tea	10,650 Acres.
" Cocoa	642 "
" Coffee, Cardamons and Sundries	343 "
" Forest Grass and uncultivated Land	4,825 "
	Total .. 16,460 "

MINOR PRODUCTS.

London, April 9.

OIL, LEMON.—Flat. It is possible to buy good brands at 3s 6d per lb. on the spot, though one holder asks 4s f.o.h., which would indicate a higher market in Messina.

OIL, LEMONGRASS.—From 4½d to 5d. per oz is asked, according to holder, for good oil.

QUININE.—The Amsterdam bark-auctions were no sooner over than speculation as to the fate of quinine commenced. By Friday it became known that the manufacturers had tacitly agreed upon a decline, and on Monday it was known on 'Change that this decline, was 1½d per oz. We believe that the decision was arrived at reluctantly, at least on the part of English manufacturers, who are not at all frightened by the advent of Java quinine. The market closes without firmness, and the sale of Java quinine at 8d per oz in Amsterdam may weaken it still further. Ferri et quiniæ citras is now quoted at 5d per oz in 25 oz tins, and 6d per oz in 1-oz phials for quantities of not less than 100 oz.—*Chemist and Druggist*, April 9.

BUYING CATTLE AND EXPORTING THEM FROM CEYLON.

It is not often one hears of cattle being purchased and shipped out of Ceylon. Some time ago the Private Secretary of the Governor of Mauritius was over at the Agricultural School enquiring about native bulls for draught purposes. Cattle have to be imported from Madagascar to Mauritius and the expense of this is very great. The Mauritius Government wanted a herd of native bullocks for use in Government carts, but though the Agricultural School authorities were asked to make arrangements for the collection of a fairly large number of animals, nothing further has been heard from the Mauritius Government.

Last week a Wynaad planter was a visitor at the Government Dairy and offered to take over a number of Sind cattle; but, of course, they were not available. The gentleman has left a commission for the purchase of some animals at the next sale of dairy stock. The manager of the dairy succeeded in procuring for him locally a couple of good animals which were taken on Saturday at Calicut. At the request of the French Consul a pair of young Sinhalese cattle have been procured for shipment to Hongkong; they are said to be going to Dr. Yersin, of plague fame, for breeding experiments.

We now hear of Sinhalese cattle being wanted for Trinidad, but for what purpose we cannot say. Trinidad has its Government Dairy and Breeding Farm which is working very successfully. It was in fact this establishment which suggested the idea of starting the Ceylon Government Dairy to Sir Arthur Havelock, who was formerly Governor of Trinidad. The Trinidad dairy farm has a satisfactory lot of cross-bred (English—Indian) animals and what it wants with our degenerated native cows (which seldom give more than 2 or 3 pints of milk a day) it is difficult to imagine. Can the Trinidad people be thinking that the Government dairy is working with Sinhalese animals, or be confusing Sind and Sinhalese?

TEA PROSPECTS IN NORTHERN INDIA.—Messrs. W. Moran & Co. of Calcutta report on 21st April:—"Some good showers of rain have again been reported from Cachar and Sylhet, but have dried up again and a great deal more is required to bring on the plant which is very backward. All other districts appear to have had a few inches, doing an immense amount of good. From parts of Assam the weather is said to be too cold."

EXCHANGE AND THE TEA TRADE.

A MERCHANT kindly sends us *The Economist* of April 9th with the following letter ("rather strong" in its terms he naturally thinks):—

EXCHANGE AND THE TEA TRADE.

To the Editor of the *Economist*.

Sir,—I am often puzzled by the statements made by traders concerning the effect of exchange on their business, but I have seldom been so puzzled as by a comparison of the letter from your Ceylon correspondent, Harold Skrine, with your own note about the tea trade. He says with respect to the 1s 4d rupee:—"Here we have our own Government putting a premium of 40 per cent. on the opening up of Japan and Formosa. Is Ceylon to go the way of Barbadoes? All pecuniary enterprise is paralysed, and the lately prosperous Ceylon reduced to the condition of a fraudulent South American Republic."

In your note, p. 510, you say with respect to last year's tea trade:—"From Ceylon the teas were seldom of fine quality. The total exports from Ceylon increased from 108 million lb to 116 million lb and the consumption of Ceylon tea kept pace with the receipts. The quality of the Japan tea crop was fully maintained, and the supplies to this country increased from 25,000 to 26,000 packages."

Which of the two is right—Mr. Skrine, who says that Ceylon tea is ruined by the high exchange value of the rupee, or you, who tell us of the increased export of tea from Ceylon, in spite of superior quality in Japan tea?

I should not call attention to this point if it were not for the nonsense so constantly talked by merchants about the effect of exchange on trade, and for the absurd attacks they make on the Indian Government for not allowing the rupee to fall to its silver value. — Your obedient servant FARRER.

Abinger Hall, Dorking, April 3rd, 1898, Lord Farrer and *The Economist* are both in the dark as to the nature of the Tea Industry of Ceylon. They evidently think that tea planters are like British farmers, able to change their crop at pleasure, or to abandon fields at short notice, so soon as they find that the returns leave no profit. Lord Farrer must be told that the tea plant is not an annual, but a perennial; that plantations are formed, planted and kept clean at great expense and to stop cultivation or allow weeds get in, would be a very serious matter, entailing double expense later on to recover ground, should the adverse circumstances be temporary. Then again there was little or no indication in 1896 that Exchange was to be adverse during 1897; and indeed the expectation all through last year was that the rupee could not be kept at so high a value. So that the tea planters necessarily went on taking their crops, hoping against hope for better returns. But Lord Farrer may be concerned to learn that the process of abandoning fields of tea has already commenced to some extent in Ceylon and it is bound to go on in certain of our older districts, unless exchange becomes more favorable or prices improve. But has Lord Farrer thought of the case of the millions of Indian ryots growing produce—wheat, jute, cotton—for export and how hardly the artificial rupee and high exchange press upon them? Just as his Lordship is so firm in allowing no interference with the "gold standard" at home, so should we expect him to be equally strong in maintaining that an honest silver currency was best for India. What is the Government and its revenue, compared to

the prosperity of the country with its hundreds of millions of people as a whole? For the sterling indebtedness and home charges of the Government, a levy on exports would be far preferable to interference with the currency.

MR. MACDONALD OF RAMIE FAME.

Mr. Macdonald, of the firm of Messrs. Macdonald, Boyd & Co., who was interviewed by the *Observer*, when in Ceylon last year and has since been in England forwarding the interests of the Company that has been floated, viz. the Muir Central Factory Company, of which he is one of the two managing directors. The capital of the Company is £25,000 and the whole of that capital has been readily subscribed. Mr. Macdonald is now on his way to Johore, to make preparations for the arrival of the machinery, over 200 tons of which will very shortly be on the way to the new works. This machinery includes four batteries of forty decorticators with the necessary engines, appliances and the subsidiary machinery.

Mr. Macdonald is as sanguine as ever as regards ramie fibre and both its productiveness and its profitable character. He hopes to return home before Christmas with a hundred tons of manufactured ramie. This depends upon the state of forwardness he finds when he reaches Johore. There may be delays but he hopes not. The machinery he is about to put down will turn out from 100 to 120 tons per month. He has received orders already for 400 tons from firms in Scotland and Saxony, and they are willing to take that quantity per month when it can be supplied. He calculates that it will be three years before he will be able to do that, but each month after he makes a start will shew a progressive increase and so far as he can, he will push matters on with all his accustomed vigour.

Mr. Macdonald went upcountry to see Mr. Manly Power, who has a decorticator at work, with the view of seeing what can be done in Ceylon with ramie fibre.

TEA BLIGHT AND PESTS.

Among other things Dr. Watt in his new book tells us that, paradoxical as it may seem, success in tea cultivation "consist in the production and development of a diseased state. The fattened ox is in reality an animal in a condition of disease." In other words, animals and plants are, strictly speaking, diseased whenever their natural functions are disarranged. "The tea is forced to produce an abnormal or disproportionate amount of leaf, having been refused the rest given after fruiting." These and similar observations are very much to the point. Dr. Watt further tells us that the chief cause of the late blushing of the purer Assam *jats* of tea is an undescribed mite which he found all but universal throughout Assam. It would seem to be found only on this tea, as he absolutely failed to detect it in the jungles around the tea gardens. This circumstance, he says, "will no doubt come as a revelation to many planters, since the opinion that the pale colour of Assam indigenous was an indication of the high quality of the *jat*, is all but universally held." Another point which Dr. Watt has brought is that out of the hybrid teas are those upon which the mosquito blight first makes its appearance, while the China and hybrid varieties *jat* first attract the red spider, the Assam being

comparatively free. In concluding his observations on this subject, Dr. Watt says: "During the past half century of cultivation, many very remarkable changes have taken place in the properties and disease-resisting powers of the Assam plant; I need hardly add that the problem, to my mind, that presents itself for consideration is more one of methods of prevention rather than of cure." We hope to return to the subject in a future issue.—*Indian Planters' Gazette*, April 23.

MR. C. TOTTENHAM AND HIS PLUMBAGO ENTERPRISE.

After an enjoyable stay of some months, seeing after his interests in Ceylon, Mr. Tottenham left per ss. "Shropshire"; but he is very certain to return, indeed to make an annual visit, in order to avoid winter and spring in England. It is pleasant to learn that an old Colonist like Mr. Tottenham, after a long absence, has found the climate of the district bordering between Kurunegala and Matale suit him so well, that he is able to say that he has enjoyed better health than for some time latterly in England. Mr. Tottenham has been busy about many things; but the most important matter, so far as the public is concerned, is his determination to develop the plumbago deposits on his property and that to this end he has just entered into a five years' agreement with Capt. Tregay who has been so long associated with him in Spain and elsewhere in mining enterprises. It is quite certain that plumbago is on the Morankande property and of fine quality; but as to the extent of the deposits, it is impossible to say until the digging and mining operations, chiefly on a hillside, have developed a good deal. But a full trial is now certain, and Capt. Tregay's work will be peculiarly interesting as that of the first plumbago mine in Ceylon developed from the beginning under European professional direction. Mr. Tottenham has this further encouragement that close to his property are more than one native plumbago mine, although in one case the absence of pumping arrangements stopped work, while in another, strange to say, the hard gneiss rock has to be blasted in order to get at the deposit of plumbago—a most unusual circumstance, yet the natives find it a profitable operation and they blast away very contentedly. It will be extremely interesting to see what the next year or two may bring to light through Capt. Tregay's operations, and it is important to know that the services of this very experienced Mining Engineer can be made available to Government or private individuals for special examination and report on land or quartz supposed to contain minerals. We would ask in this connection, what delays the long-promised Geological Survey? The Indian authorities are surely not behaving well to Sir West Ridgeway in this matter, unless it be that they are, geologically, shorthanded themselves. No one is more likely to prize the presence of an experienced Mining Engineer to follow up likely spots in the Survey, than the Geologist himself; and we trust to see important results follow both from the work of the member of the Indian Geological Survey when he comes and from that of Captain Tregay, M.E.

Meantime, we say farewell with all good wishes to Mr. Tottenham in the hope of seeing him back again in our midst, active and hearty,

before Christmas. By that time he should see the evidence of the narrow gauge line between Colombo and Kelani Valley being started—with, we trust, the probability of seeing the same gauge carried on North from Colombo. Mr. Tottenham thinks it both financial and engineering folly to carry a mile of broad gauge beyond Kuruncgala and he well knows the country thence due North.

PLANTING NOTES.

NEW AREAS OF CULTIVATION IN THE HAMBAN-TOTA DISTRICT.—Mr. Hopkins reports for 1897:—About 140 acres of land have been brought under cultivation in the Magam pattu during the year, and Mr. Elliott has added 225 acres to the cultivated area of the Walawe estate. Lands lately sold under the Walawe channels have been cleared but not yet cultivated. They are therefore not included in this year's return.

NEW AREAS UNDER CULTIVATION IN THE SOUTHERN PROVINCE—are thus referred to Mr. Wace in his report for 1897:—

In the Four Gravets and Akmimana districts the extent open up for tea and coconut is 250 acres; in the Gangaboda pattu about 160 acres; in the Talpe pattu about 100 acres. In Wellaboda pattu large areas have been opened for cinnamon, tea and coconuts, but the Mudaliyar states he cannot give extents with any accuracy. In the Bentota-Walallawiti korale the Mudaliyar quotes 507 acres as opened with cinnamon, tea, and coconut. The acreage offered during the year at the Gall Kachcheri was 1,318 acres.

PEPPER AND RUBBER: GOVERNMENT GARDENS AT THE STRAITS.—We call attention to an interesting Report reproduced in our *Tropical Agriculturist* dealing with a number of items of practical interest to Ceylon agriculturists—more especially in respect of rubber experiments, showing how trees of Para have yielded returns at 10 years old up to £59—at 9 years £47 and so on—gross per acre, and how Para is found to grow well on swampy ground. For other interesting facts, we refer to the report, and to other extracts about Pepper, another new (or rather old) Product which ought to be grown extensively here.

LIBERIAN COFFEE.—Mr. W. Turing Mackenzie, writes to the *Singapore Free Press* that while Selangor this year is to export 12,639 pikuls of Liberian coffee, for 1902 the figures are estimated at 64,533 pikuls. He adds that the East Coast of Sumatra is bound to do something considerable; but if so, how does Mr. Mackenzie explain Mr. Baker and his Dutch superiors abandoning Liberian coffee for tea? Our old friend is strong on the need of pushing Liberian coffee at home after the pattern set in the case of Ceylon tea some years ago; and as usual he winds up with a good story:—

Let every one interested in Liberian coffee send home a few lb. of the fragrant bean to his sisters, his cousins and his aunts, while Straits planters should urge Ceylon tea sellers to add Straits coffee to their list; there are many old Sumatra planters in business in Europe and elsewhere who would, I should imagine, gladly take up and push the sale of *Serdang coffee*. New York is a market to be captured, but, listen. An American gentleman once came to me and asked how many pikuls of Liberian coffee I could give him. I mentioned the figure—a few hundreds. "Can't you multiply that by 10?" he asked. On my intimating that my arithmetical powers did not go so far, he replied, "Waal, sir, ef you cayn't give it us, we must make it." Subsequently I made enquiries as to the manufacture of Liberian coffee in the United States. The ingredients mentioned to me did not sound as if they would yield a savoury beverage.

CONCERNING SOME STERLING TEA PLANTATION COMPANIES.

A planting correspondent asks how it is that we have refrained from noticing the wonderful differences shown in the "profits per acre" from different estates in the interesting table supplied in their Report by the Directors of the Nuwara Eliya Tea Estates Company. He adds that inasmuch as the properties of this Company are situated in the same district and within a limited distance of each other, the comparison should be all the more instructive. With this fact in view, it is certainly difficult to understand how one estate can give profits as high as £11 15s 7d per acre and four others shew profits exceeding £10 each; while the return from yet another adjacent estate is as low as £4 19s, one other giving not more than £5 15s 6d and two between £7 to £8 10s. Our correspondent ventures on no explanation himself, and we can only point out that the great differences are probably due to temporary causes since the Directors "are sanguine that those estates which this year have not given a due proportion of profit per acre will, in the future, show better results."

Of more general interest is it to consider the position of some of our sterling companies as a whole. The Nuwara Eliya Company has undoubtedly a very fine list of tea properties at the highest elevation in the island and yet its dividend of 6 per cent. looks very modest beside the 15 of the premier Ceylon Tea Plantations, and also of the Standard, Company. But then it must be remembered under what different circumstances these several Companies were formed. The estates in the "Nuwara Eliya" list were purchased three years ago when tea was very prosperous and prices high, so that the 2,632 acres of tea of all ages belonging to this Company must average in capital and debentures not much less than £90 per acre. On the other hand the "Standard" having been formed at a much earlier stage when prices were low has a series of fine estates with some 2,482 acres under tea of all ages which cannot be said to average in capital even £30 per acre! The comparison is a rough one because the latter Company has the greater area of young and newly planted tea. If we now turn to the Ceylon Tea Plantations Company, which is among the very earliest of Ceylon tea concerns, we find it holds 8,626 acres of tea of all ages against a capital of £248,600 or less than an average of £30 per acre. A net profit of £4 10s or £5 per acre in the case of both these fortunate Companies, should be sufficient to give a 15 per cent dividend, while each has besides a handsome reserve fund, which in the case of the C.T.P. Company, is invested in coconut plantations. In this connection we direct attention to the extremely interesting statement issued by the C.T.P. Company showing the results of its working for 11 years past. It will be found on page 816, and well deserves to be examined. The growth of the Company from 1,251 acres yielding 504,380 lb. of tea in 1887 to the 8,067 acres and 4 million lb. crop of last year, is very striking. But no less so, is the fall in average price from 13d to 7.85d; while exchange was 1/5 14-32nds eleven years ago, touched its lowest at 1/1 15-32nds in 1895 and was last year 1/3 13-32nds. It is remarkable that the average yield per acre

has increased from 403 to 495 lb. having been as low in 1889 in 338 lb. Liberal cultivation must largely account for the improvement.

It may not be amiss to see how two more tea concerns the Imperial and Alliance—both sterling Companies and both owning hill-country plantations—compare with the foregoing. The Imperial has 1,692 acres under tea (and 100 under coffee) against a capital with debentures of, we believe, £100,000, so that the average is under £57 an acre and it might be expected to do better than 4 per cent. But it is weighted by one estate (Nonpareil with 300 acres young tea) which is in a transition state. The Alliance Company has about the same amount in capital and debentures or say £101,000 against 2,804 acres in tea giving an average of not more than £36 an acre, and yet it only paid 6 per cent. for last year. But, after all, not much importance can be attached to such rough-and-ready comparisons without considering more closely the value of the individual estates included. One plantation may be too dear at £30 an acre and another cheap even at £90. We need scarcely say that both the Alliance and Imperial, are much younger than the C.T.P. Co. and Standard Companies.

It only remains to notice the oldest and in some respects the most important Plantation Company connected with Ceylon, first known in coffee days as "The Ceylon Company, Limited," and of late years as "The Eastern Produce and Estates Co., Ltd." The former Company had seen very low days, for it had to pass through the transition time from coffee via cinchona to the beginnings of tea and had then to be wound up. Even its successor, the E. P. & E. Company, had a hard struggle at first and its shares were so low (while its liabilities for debentures were so heavy) that if any one had prophesied six or seven years ago that the day was near when these shares would be above par, as they are today, he would have been deemed as little better than a mad man. Yet the E. P. & E. Co. has arrived at the proud position now that its shares are considered to be valuable property. The Company is one of the most judiciously and economically managed, and consequently one of the most prosperous in the Ceylon list. It must not be judged by its dividends, although these have now got up to 7 per cent on the ordinary shares, but by its annual paying-off of debentures and transfers to Reserve Fund. As regards cultivated area under tea, the E. P. & E. Co. beats the Ceylon Tea Plantation Co., having no fewer than 10,650 acres not counting some hundreds under coffee and cacao. Against this there is a large capital of £300,000 besides well-nigh £102,500 of debentures—so making the average not much less, roughly, than £37 an acre. This should not be too high; for the Company owns some very fine properties and, as we have said, it is very economically managed. Its net profits last year after payment of interest on debentures were equal to well-nigh 11 per cent on the capital. But close upon £8,000 was devoted to reducing debentures; £5,000 went to Reserve Fund (now £25,000)—and about £11,000 was carried forward as a balance in order to make sure about reducing debentures again this year. We should think the shareholders will continue to be quite content with their 6 or 7 per cent, so long as they see the amount of debentures growing smaller and the Reserve Fund rising higher year by year. We need only add in conclusion that the Company's rendering of accounts is

model of simplicity. Here are two items from the debit side of the "Profit and Loss" account for last year:—

Up-keep of Estates, including cost of Purchased Leaf and depreciation on Machinery and Buildings, etc.	£ 77,610	3	10
Salaries and Office Expenses in London and Ceylon, including Directors' remuneration, Income Tax, etc.	£ 9,306	12	5

Against income:—
 Proceeds of Produce sold and brought to account at 31st December, 1897, and profits from Agency Business, Interests, etc. £121,180 5 7
 Estimated value of Produce on hand at 31st December, 1897.. £ 25,173 11 2
 The nett balance after paying interest on debentures but including balance from 1896, is £44,731 disposed of as per the Directors' Report which we published the other day.

THE EASTERN PRODUCE AND ESTATES CO., LD.

We could only, very briefly, above allude to the circumstances out of which this Company was started as the successor to "The Ceylon Company, Limited." The latter was, unfortunately, formed to take over sugar estates in Mauritius as well as to buy flourishing coffee properties in Ceylon but the name was cleverly confined to the more prosperous Colony. When a time of difficulties arrived—due more to Mauritius than Ceylon—and there had to be a reconstruction, the old shareholders of the Ceylon Company, Limited, had to be content with a £5 share in the new Eastern Produce Company in exchange for £20 paid in the Ceylon Company, Limited. The Ceylon Company, Limited, at one time owned about a sixth of the sugar estates in Mauritius and this became a cause of great embarrassment. The Company, however, paid all Ceylon creditors in full and arranged matters with old debenture-holders who had to make a small sacrifice. As regards its successor we have already referred to its prosperous career in Ceylon: but we should have made mention of its general business (outside of the plantations owned) as a correspondent reminds us. It is, of course, very creditable to the staff of the E. P. & E. Company that besides carrying on the work appertaining to its own plantations, it should do so much of general agency and engineering business. Still it must be remembered that many other Companies cure and buy outside tea leaf, and so add to their profits.

DR. GEO. WATT, C.I.E.,—in his new and voluminous work for the Government of India on "Tea Pests" and Tea-planting generally, supplies the following testimony to local authorities:—

I have only incidentally referred to Ceylon newspapers for information; but the *Tropical Agriculturist* has been found of great value in confirming or correcting information regarding India.

The very great assistance, most generously afforded, by Mr. E. E. Green, the distinguished Entomologist of Ceylon, who has for many years identified himself with the study of the tea pests and has in consequence discovered and investigated the life histories of a large number of very obscure species. Mr. Green has not only examined and reported on a complete series of the insect pests collected by me, but has in return presented a most valuable set of the pests collected by him in Ceylon. As types of the species he has named these have proved invaluable.

Ceylon Tea Plantations Company Limited.

STATEMENT SHEWING RESULTS OF WORKING FOR THE 11 YEARS ENDING 31ST DECEMBER, 1897.

Year.	Average of Tea in bearing.	Yield per Acre.	Rate of Exchange per Rs.	Sale Price of Tea (London).	Estate Tea.	Bought Leaf Tea.	Tea manufactured for others.	Total.	CAPITAL ISSUED.		Net Profits.	Additions to Reserve.	DEPRECIATION.			Dividends Issued.

BRAZIL AND ITS MIRACULOUS PALM.

In the *Forum* for March the Hon. T. L. Thompson, late United States Minister to Brazil, writes on "Brazil: its Commerce and Resources." The most interesting passage in his article is that in which he describes the marvellous tree, which grows like a weed in Brazil, but the like of which is unknown in any other part of the world. It is the carnahuba (*Copernicia ceriferi*), which grows uncultivated in the States of Parahiba, Ceara, Rio Grande do Norte, Piaui, and some of the neighbouring States. The description given of it to me seem incredible. Perhaps in no other region is a tree to be found that can be employed for such varied and useful purposes. It resists intense and protected droughts, and is always green and vigorous. Its roots produce the same medicinal effects as sarsaparilla. Its stem affords strong, light fibres, which acquire a beautiful lustre, and serves also for joists, rafters, and other building materials, as well as for stakes for fences. From parts of the tree wine and vinegar are made. It yields also a saccharine substance, as well as starch resembling sago. In periods of famine, caused by protracted droughts, the nutritious substances obtained from it are of immense benefit to the poorer classes. Its fruit is used for feeding cattle. The pulp has an agreeable taste; and the nut, which is oleaginous and emulsive, is sometimes used as a substitute for coffee. Of the wood of the stem musical instruments, water-tubs and pumps are made. The pith is an excellent substitute for cork. From the stem a white liquid, similar to the milk of the coconut, and a flour resembling maizena may be extracted. Of the straw, hats, baskets, brooms, and mats are made. A considerable quantity of this straw is shipped to Europe; and a part of it returns to Brazil manufactured into hats. The straw is also used for thatching houses. Moreover, salt is extracted from it, and likewise an alkali used in the manufacture, of common soap. But from an industrial and commercial point of view, the most valuable product of the carnahuba tree is the wax obtained from its leaves.

Was there ever such a tree described before? There are many British colonies whose climate is not unlike that of the Brazilian States in which the carnahuba palm flourishes. It might be well worth Mr. Chamberlain's attention to conduct experiments to ascertain whether or not this marvellous tree could not be naturalised in our hotter colonies, which are, at present, in need of some help from without.

PRINCE HENRY OF GERMANY.—A Peking telegram to the local Mandarins reports that the Emperor has appointed H. H. the Prince of Li, and Their Excellencies Li Hung-chang and Chang Yin-huan to go to Tientsin to meet Prince Henry of Prussia should the latter decide to visit Peking.—*N.-C. Daily News.*

SOMETHING ABOUT GUATEMALA.

"The resources of Guatemala are varied and abundant," says W. E. Curtis in the April *Forum*. "Coffee is the chief staple, and the berry is as good as the best the world provides. Corn and beans are the chief food of the people. Sugar, tobacco and other tropical plants can be raised, to an unlimited extent, on the hot lands along the coast; while wheat and other cereals yield rich harvests in the higher and more temperate districts of the interior. Guatemala might easily

sustain ten times its present population. The soil is rich and easily cultivated, and, unlike the other Central American republics, there is plenty of labor. Some parts of the country are quite thickly populated, but the others are covered with dense forests and a variety of timber which might be easily made marketable if means of transportation were provided. But, although Guatemala is much further advanced than the rest of Central America, her railway system does not exceed 250 miles; there is no internal navigation, and the wagon roads are in a deplorable condition. The mineral wealth of the country is supposed to be large, but it is only slightly developed. The mines are inaccessible, and, in the absence of modern machinery, which at present cannot be conveyed to them, cannot be worked with profit. The Government offers generous inducements to immigrants. The land laws are liberal, and efforts have been made from time to time to secure the establishment of colonies and the preemption, of public lands by private settlers. But all the accessible area is at present occupied, and no foreigner can expect to prosper in Guatemala unless he has abundant capital which enables him to purchase at high prices plantations already developed. If peace could be assured, if railways and wagon roads could be extended into the interior—so that the timber regions, the mineral deposits and the wild agricultural lands could be reached as conveniently as the new portions of our own country—Guatemala would offer great advantages to the immigrant and would enjoy a rapid development.

COFFEE PLANTING is likely to become an important industry in the Transvaal. The *Cape Times* says: It appears that the entire Eastern part of the Transvaal, from Spelonken in the North to Vryheid in the South, contains tracts of ground particularly suitable for the cultivation of coffee. The coffee plant must be sheltered and the chain of mountains from North to South through the Eastern half of the Transvaal affords that shelter. The equatorial current from the Indian Ocean and the other ocean currents blowing in a Southerly direction through the Mozambique Channel have a beneficial influence upon the cultivation. Right up, in the North in Servaas' country, many farmers grow their own coffee. One farms in the Lydenburg district, in Watervallei, on the slopes of Spitzkop and the Secoconie's Mountains, coffee has been cultivated with success. Some time ago Mr. Spearman, representing a Natal syndicate, inspected several localities with a view of establishing plantations. He was convinced of the suitability of the soil and climate. To the North and North-east of Middelburg, in that part of the district known as the "Banken," and in the immediate vicinity of the Cobalt Mines, the coffee plant as well as the date palm grew luxuriantly. The climate of the Vryheid district is eminently suitable for the cultivation of the plant, and on the farms of Messrs. Gune, Boistelman, Potgeiter, and others, coffee plantations of three years' growth yield 12 lb. per tree annually. These men find that it pays better than sheepfarming. Coffee from the district exhibited in the Vryheid Show in 1896 was judged to be of excellent quality. The plant appears to grow best in a loose, sandy soil of a reddish colour. It must be sheltered against wind and frost. Twenty-five years ago a farmer, named Gysbert van Rooyen, grew not only his own coffee, but his sugar.

OUR RICE SUPPLY AND LOCAL CULTIVATION :

OUR DEPENDENCE ON INDIA TO WHICH WE PAY 20 MILLION RUPEES YEARLY FOR RICE;

MR. ELLIOTT'S WALAWÉ EXPERIMENT FIVE YEARS' EXPERIENCE OF PADDY RENTS' ABOLITION: A SPECIAL REPORT SHOULD BE CALLED FOR.

OUR RICE IMPORTS FROM INDIA INCREASING—ARE LOCAL CROPS INCREASING? THE COLONIAL OFFICE REGRET THE CHECK TO "TANK RESTORATION" OF LATE YEARS; BUT MR. CHAMBERLAIN'S POLICY OF TAKING REVENUE FOR NORTHERN RAILWAY A FATAL BLOW: "PUTTING THE CART" BEFORE THE "HORSE."

There never was an occasion in the modern history of Ceylon when greater interest should be felt in the question of local Rice Cultivation than at the present moment. The threatened advent and spread of plague in Bengal is enough warrant of itself for this statement. But it has for the past fifty years been a sore subject with thoughtful members of the Ceylon Government and general community that so large a sum of money should every year have to be paid away to India for the needful supply of our staple article of food, more especially in view of the attractive tradition that the island at one time grew enough rice for a larger population than it holds at present. If true, that must have been—as we have shown elsewhere by indisputable facts—very far back in its history, long before any European touched its shores. We have, however, to deal with our own day and to point out the immense importance of any local attempts to free ourselves from so much dependence on India, and the unprecedented encouragement now offering to native as well as European capitalists to make experiments in rice culture. The encouragement is found in the unusually high range of prices of late for imported rice, in the ten per cent "Protection" duty, in the countenance and aid of the authorities in any reasonable proposals and in the existence of suitable, irrigable land in more than one district available for cultivation. If in the face of these several advantages it can be shown that rice-growing in Ceylon is not profitable, then indeed may we despair of ever seeing our dependence on India, Burma or other rice-growing countries greatly lessened, or of North-Central or North Ceylon ever doing much to redress the balance.

However, we have rather more than theory to offer and it is well that due attention should be given to Mr. Elliott's statement (appended) of his full belief in the profitable nature of the enterprise he has himself taken in hand in the Walawé district of the Southern Province. There is land there and at Tissa, we believe, available for a good deal of extension should capitalists, at this time especially, think of trying an industry for whose produce there is always a local demand. But in considering this matter, surprise must be felt that during the past five years far more has not been done by native landholders and cultivators—to the manner born—for the extension of the industry of which they know more than any other in the land. We need not recall what Governors Ward, Robinson, Gregory and Gordon did to revive and extend rice cultivation. It was always said in their time, however, by adverse critics that

the interference of Government as rent collector, with the tricks and extortions of headmen operated as a strong discouragement to any extension of the chief industry of the Sinhalese and Tamils. 'If only the Paddy Rents (or let us for once say Paddy 'Tax') and all its abominations were abolished, what a change would be witnessed!' Well at a stroke of the pen Lord Knutsford abolished the Rents; five years have elapsed; five millions of rupees of revenue (not to speak of extortions never accounted for) have been left in the pockets of those who used to pay the same to Government; a Protection duty has been in operation all these five years and this and "dear rice" (for most of the time) have operated as strong encouragements to extend;—and yet where are we to look for the great change, where do we find any evidence of an extension of rice cultivation among the natives under such exceptional circumstances, or where even, may we ask in our ignorance, is there any special evidence of a marked improvement in the condition of the people? The Reports of the Provincial Agents and their District Assistants have little or nothing to tell us of extension, or improvement, year by year, during the past five years; and we are driven to the conclusion that in the interests of the people and permanent prosperity of the country, a fatal mistake was made in the total abolition of the Rents, instead of modifying and abating the same in the poorer districts, and devoting the whole of the rest of the collection to the promotion of Irrigation and the improvement of the means by which the industry existed.

The subject is one that ought to be taken up in the Legislative Council, and the General European Member, as standing between the Planting and Mercantile and Native Representatives, might well be expected to make it his own. A special Report should be required from all the Agents and their Assistants on the results noted in their several Districts from the abolition of the Paddy Rents in 1893. A few pointed questions should be embodied in the official circular:—(1) as to extension (or contraction) of cultivation; (2) whether as much attention is given to the fields as before 1893; (3) who have chiefly benefitted (a select number of landholders, money-lenders and headmen—or the actual cultivators) by the remission of the rents; (4) whether the general condition of the people has improved. More practical and useful suggestions than these can doubtless be made. The local Government as well as the Colonial Office should welcome such a Report. Five years is a considerable period in a tropical land and there is the risk if further delay be made, of losing some more of the Public Servants with most experience of native rice cultivation in the era of paddy rents. Such a Report might be of great use to the Irrigation Department, and it would help to elucidate several puzzling problems such as the scarcity, almost famine, not long ago reported from one of the special rice-growing divisions of Batticaloa; and further how it is that cultivation does not extend on the unoccupied land within the Jaffna peninsula, although the crowded population in certain districts, are supposed to be ready to go out into the Wannu if a railway were made. The full expectation,—when the "rents" were abolished and "protection" established,—was that the effect would be felt in the Customs figures showing the import and how

consumption of rice. Such import should have been checked and, by this time lessened. Here is the comparison between two quinquennial periods before and after abolition:—

BUSHEL'S OF RICE IMPORTED AND ENTERED FOR HOME CONSUMPTION.

1888 ..	6,630,094	1893 ..	7,447,376
1889 ..	6,591,157	1894 ..	7,556,505
1890 ..	6,350,036	1895 ..	8,722,737
1891 ..	7,051,432	1896 ..	7,594,413
1892 ..	7,282,411	1897 ..	7,354,690

Total 33,905,130 Total 33,675,721

The falling-off in imports during 1896 and 1897 is generally attributed to the Indian Famine and continuous dearth of rice; but it will be interesting to know from the District Reports whether the Revenue Officers can discover that extended local cultivation and increased crops influenced the local market to any extent? The Blue Book grain-crop returns were never deemed very trustworthy even in the days when the collection of "rents" should have given the officials some check on their headmen's figures. Now that the check is gone, we suppose there is less reason to rely on them? But it is fair to mention that they show an increase for 1894-6 (the returns for 1897 are not yet published) as to "paddy," though not as to "fine grain." If, however, headmen are interested in giving big returns, now that there is no rent to pay, the figures for each division will have to be carefully scrutinised. It will be specially interesting to learn, after the Provincial and District Officers give their special attention to the subject, if in their opinion, cultivation has been extended, or improved, or whether the improved figures in the Blue Book, if more than mere guess-work, are due to better seasons and crops. Most of the Civil Servants concerned, would, we feel sure, endeavour to make a full and fair Report on so important a subject and few State Papers for a long time back ought to be of more value and interest both to the Government and the general public.

No doubt the permanent officials of the Colonial Office who probably had little to do with the "Rent abolition" (if we except the late Mr. Fairfield) have fully realised by this time, the great blow it delivered at the Irrigation Policy of Governors Gregory and Gordon, both of whom as well as Sir Hercules Robinson, Sir James Longden and Sir Arthur Birch cordially supported the Protests we published in London in 1892 against the threatened Paddy Rents policy of Lord Knutsford and Sir Arthur Havelock. But it does not seem that the Colonial Office has profited by that lesson if Mr. Chamberlain is now acting on Office advice in the fatal course of appropriating large slices of our general revenue to payment of Railway Extension Northwards. Mr. Chamberlain in one breath bemoans the fact that little or nothing has been done in Restoration of Tanks of recent years. In the next, he takes away the very sinews of war which would enable so admirable an Irrigation adviser as Mr. Henry Parker, to show a good record. If the £1,500,000 (or is it to be £3,000,000?) to be taken from General Revenue for a non-productive Railway were devoted to irrigation works judiciously selected by Mr. Parker, there would be hope of sources of traffic arising within a reasonable date where few or none now exist. It is the expectation of some people that the Railway of itself is to renovate the wilderness of unoccupied country. Was ever a madder idea? We have heard of Railways in America and Australia

following pioneers (after a good many years often); but *in ver of preceding them*. In Ceylon hitherto, the opening of no single forest or waste district has been due to the Railway; roads have done much (and the North is beautifully roaded) and the Railway has come to carry away heavy traffic. Mr. Chamberlain is putting the cart before the horse. He ought to have appropriated the available revenue for tank restoration to come first and borrowed for the Railway to follow, and then he would have some reason to anticipate traffic. It is said of course that a locomotive line will aid the work of Irrigation engineers and tank-makers; but surely the very cheapest form, a 2½-foot tramway would suffice for this and for all the traffic of the North-Central, Northern and Eastern regions for fifty if not a hundred years to come, seeing that a 2-foot locomotive line in Tasmania is equal to 100,000 tons per annum. When will 100,000 tons be carried on an Anuradhapura-Jaffna line, even if we add Trincomalee and Batticaloa traffic? The result of the broadgauge policy, if carried out, will be to cripple the revenue of the Colony for Irrigation Works for many years to come, and yet the only hope of traffic in our North-Central regions hinges on the possibilities of Irrigation.

RICE CULTIVATION IN THE HAMBANTOTA DISTRICT:

MR. ELLIOTT'S EXPERIENCE HOW THE UVA PLANTERS CAN BE BENEFITTED.

The *Observer* has called attention very briefly to Mr. E. Elliott's advertisement and the significance of his offer to the planters of Haputale. He reports to us that he has secured an excellent crop of paddy (rice in the husk) over several hundred acres, and that his matured experience now confirms him in his views that rice cultivation can be profitably carried out by Europeans. Excellent crops have been raised both in the Walauwa and at Tissa, where paddy lately sold at R7 for the munnam of 6 bushels; but it has gone up already to R9, and at Tangalle to R10, and is expected to reach R2 per bushel. This paddy is purchased by traders who retail it in East Matara and adjacent districts, chiefly to women who make a living by pounding the same and selling the rice. Further, a good deal of rice is sent to Koslande (Haputale) by steamer to Hambantota and thence by cart, and so successfully competing with the railway. Buying at Hambantota, planters save freight and shipping and landing charges which equal quite 25 cents a bushel. There is no reason why planters should not buy the locally-grown paddy and get it turned into rice by their own cooly women, or adjacent villagers; (or why not a few of them club together and get a hulling machine.) Buying paddy in this way should save 50 cents a bushel on the rice. Every Tamil woman is accustomed to pound out paddy—a daily household duty in Southern India as in Ceylon—and a woman can pound out a bushel of rice in a day.

QUARRY STONE.—It is claimed that the largest single stone ever quarried is the Wisconsin monolith, which is 115 feet long, ten feet square at the base and four feet square at the top.—*Indian Witness*, April 15.

PLANTING NOTES.

THE able address of Mr. MacLure, of Mochla estate, on the equity and wisdom of charging interest on a certain proportion of the advances made to Kanganias, constitutes the chief feature in the Maskeliya P.A. proceedings given page 809. And although nothing came of his speech or motion at the meeting, they will be by no means thrown away, as ventilating, for the first time, a question that is likely to come more and more to the front as months roll on. The old patriarchal mode of dealing with Ramasamy is falling gradually into abeyance, very much at the instance of Ramasamy himself, and there is no doubt that both coolies and kanganias have got too much into the way of regarding their masters as bankers to be drawn on to the fullest possible extent *for money without a cent of interest*. The readiness they show in changing masters, will no doubt by-and-bye, lead to a united determination to show kanganias that money is not to be got save on business lines. But one thing at a time, and certainly the great matter is to give Labour Federation a fair and adequate trial for the present.—We cannot believe for a moment that there is any official intention to sell a single acre of Crown forestland above the 5,000 feet limit. In fact, the Ceylon Government dare not do so: an information could be laid against him for something like High Treason if the Colonial Secretary attempted such a sale until the Order of the Secretary of State is rescinded! So the gentlemen in Maskeliya who are anxious about the matter may make themselves quite happy—and take our word for it that the 5,000 feet limit is inviolable!

THE CEYLON FOREST DEPARTMENT AND FORESTS.—The Saw Mill operations, either at Udagama, or at Batticaloa, have not—says our evening contemporary—been very successful, and though it would be premature to declare them both financial failures, it is the general experience of people in Ceylon that Saw Mills do not pay. In the case of the Forest Department Saw Mill, we have no doubt the experience has been the same, but it is in no way peculiar. The season is simply because Ceylon Forests are not packed with vast masses of trees of the same kind or quality. We do not possess the official returns and verifications of the wood that is said to have “rotted on the sea shore” in “hundred of logs,” but it is not novel in our experience to read of “hundreds” that turned out to less than “tens.” In this particular we are reminded of an instance in which, “one who knew,” reported to Government an instance in which he undertook to point out “upwards of ten thousand trees” that had been felled in a Crown Forest, and when a strict verification was made, the nett result was one tree, and twenty-six “warrachies”! So much for round numbers. We notice that firewood is said to yield 600 yards per acre in medium forests. We learn from those who have had some years experience of firewood supply, that 120 yards per acre is a high yield, and frequently only 70 is obtained. We might also remind our readers that a considerable area of land was lately been sold in planting districts for R50 to R80 per acre, upset price, only because of the value of the firewood, and that there was a demand for it. It is also within our knowledge that land has been reserved from sale by Government till the firewood has been worked out.

DEVELOPING THE TEA INDUSTRY.
AMERICAN MARKET FUND.

The following Report has been issued from the Indian Tea Association, Royal Exchange Building, Calcutta, 15th April, 1898.

To all Proprietors and Agents of Tea Gardens. Dear Sirs,—In accordance with their annual custom, the general Committee have recently had the pleasure of circulating to all members of the Association, and its branches in Assam, Cachar, and Sylhet, as well as to the various Planters' Associations with whom they correspond, copies of the last Interim Report of the American and Foreign Tea Committee of the London branch of the Association, under the control of which Mr. Blechynden carries on his operations in America for the extension of the trade there in Indian tea. This Report, which is dated the 15th of February, 1898, and which was accompanied by an extract from Mr. Blechynden's report for the year 1897, summarises the results of the joint work of Mr. Blechynden and Mr. Mackenzie, the Ceylon representative, during the past year, and also gives details of the manner in which the funds subscribed in India have been expended. It will no doubt have been noticed that Mr. Blechynden's plan of campaign has been somewhat altered, and that it has been thought advisable to spend in advertising a larger amount of the funds available than has been the case in former years. Mr. Blechynden appears to have exercised great care and judgment in distributing his advertisements with the view of reaching the largest possible number of the tea drinking population. He has not, however, confined his efforts entirely to advertising, as considerable subsidies have been paid to firms undertaking to push British grown tea on definite lines, and it is intended to work more extensively on this latter system during the present year. He has also personally visited most of the large centres where the tea is being sold, satisfying himself that the spirit, as well as the letter of the arrangements made by him, were being carried out. Mr. Blechynden has continued to co-operate, under the direction and supervision of the London Committee, with Mr. Mackenzie, in the work of making known the existence and merits of British grown tea in the main centres of population in the United States. The arrangements under which the representatives of the two countries agreed to work conjointly, instead of in competition have, there is no doubt, been the means of arriving at distinctly better results than would otherwise have been the case.

The General Committee have much pleasure in placing before members the following figures which show in a concise form, the progress made in the use of Indian and Ceylon tea in North America. It will be seen that not only has the annual quantity taken nearly quadrupled since the year 1892, but that every year has shown a steady increase:—

INDIAN AND CEYLON TEA TAKEN BY NORTH AMERICA DURING EACH OF THE LAST SIX YEARS.
Indian.—1897, 5,663,000; 1896, 5,259,000; 1895, 4,072,000; 1894, 2,428,000; 1893, 2,111,000; 1892, 1,586,000 lb.

Ceylon.—1897, 5,699,000; 1896, 4,365,000; 1895, 3,745,000; 1894, 2,295,000; 1893, 1,871,000; 1892, 1,490,000 lb.

Total lb.—1897, 11,362,000; 1896, 9,624,000; 1895, 7,817,000; 1894, 4,723,000; 1893, 3,982,000; 1892, 3,076,000 lb.

In view of the certain increase in production both in India and Ceylon, during the next few years, and of the strong recommendations of the representatives of both countries, and also in the hope of counteracting the efforts which have been recently set on foot by the Japan tea industry, the London Committee have unanimously resolved that it is most desirable to maintain the work in America, and they have consequently recommended another levy on the same lines as that of last year.

The subscriptions for 1897 amounted to R1,02,039 collected in Calcutta, and a sum of £200 from a Company in London, which had hitherto held aloof. This compares favourably with the result of the levy for 1896, which amounted to R1,03,674. Liberal contributions have again been received from the two Planters' Associations in the Travancore District, for which the General Committee beg to tender their sincere acknowledgments.

The General Committee now instruct me again to ask for support from the gardens owned by you, or under your agency, on the same basis as last year, viz., at the rate of 4 annas per acre under cultivation, and half an anna per maund on the production. In making this request the Committee would again point out that a very large number of tea concerns still hold aloof from contributing to this Fund, while at the same time deriving equal benefit with the subscribers from the resulting extension of the trade. The Committee would repeat that it is only reasonable that an enterprise undertaken for the general benefit should be generally supported on the ground of a common interest and a common advantage, and they trust that the amount forthcoming this year may show a substantial increase on the sum contributed in 1897.

The General Committee would feel obliged if the support now solicited could be intimated to me not later than the 15th of June on the annexed form.—Yours faithfully, W. PARSONS, *Planter*, April 23. Secretary.

THE STANDARD TEA COMPANY.

We direct attention to the full report of the proceedings at the annual meeting of this Company given on another page. The worthy Chairman Mr. Alex. Brooke of the well-known Fenchurch Street firm, had a pleasurable duty to perform in announcing the continuance of the very handsome dividend of 15 per cent, notwithstanding the hard times. Nor was this voted by the Directors without making some provision (£1,000) for depreciation, adding £1,000 to reserve, and carrying £795 odd forward. This shows the good management of the fine properties owned by the Company and reflects credit on Directors, local Agents, Inspectors and Estate Managers all round. But the serious nature of the crisis overtaking our tea industry, through low prices, high exchange (dear rice and dear freight, though we hope these are only very temporary) was fully recognised; and the shareholders may feel confident of the continued careful manufacture of fine teas and watchful oversight of coolies on the estates, as well as of rice and shipping conditions in Colombo.

INDIAN PATENTS.—Applications for the under specified inventions have been made:—No. 112.—Samuel Cleland Davidson, of Belfast, for improvements in the construction of trays or sieves of foraminous material for use in machines for drying tea or other substances.—*Indian and Eastern Engineer*.

PLANTING NOTES.

AMSTERDAM BARK AND QUININE MARKETS.—All the 8,750 ozs of Java quinine offered at today's auctions in Amsterdam were sold, part of it at an equivalent of a fraction over 9d per oz and the rest at the equivalent of 8 1-10d to 8 3-20d per oz.—*British and Colonial Druggist*, April 8.

SALE OF ANOTHER COCONUT ESTATE TO EUROPEANS.—We hear that the Plopallai estate in Jaffna, consisting of 1,500 acres, of which 1,000 are in coconuts in full bearing and 500 acres in jungle, have been sold by Mr. Senathirajah to Mr. Lilley of Batticaloa but the price paid has not transpired. Mr. Lilley intends to reside on the estate with Mr. Candy—who has just come out from home—and will divide in his time between his work in Batticaloa and Jaffna.

PUSHING CEYLON TEA IN GERMANY.—Many of our readers will remember Mr. Chas. Bohringer, who came first to Colombo for the purpose of buying cinchona bark, and who has since established an importing house here. He is now in Stuttgart, where, we learn, he has opened several tea-shops for the sale of tea, both in the cup and dry. The tea dealt in is purely Ceylon, we understand, and Mr. Bohringer is confident that a considerable demand is likely, in course of time, to spring up in South Germany for Ceylon tea. He is doing this without any assistance from the Tea Fund.

A NEW LIQUID COFFEE.—Messrs. Cooper, Cooper & Co., Ltd., 16, Philpot Lane, London, E.C., whose name is identified with the introduction of high-class teas, have recently placed upon the market a new liquid coffee, known as "Siloa." This marks a distinct advance over the numerous essences and extracts heretofore in use. It has all the flavour and aroma of coffee made from the freshly roasted and ground berry, while it can, of course, be made without any of the trouble and apparatus which the older system necessitates.—*British Trade Journal*.

AMSTERDAM COCOA BUTTER MARKET.—Our Amsterdam representative sends us today the result of the cocoa butter auctions held in Holland on the 5th inst., from which it appears that all the 70 tons of *Van Houten's* make put up were sold at 50.66 cents per half-kilo (about 9½d. per lb.); that all the 5 tons from the *Hollandsche Cocafabriek* were bought in; that of the 5 tons of the "*Helm*" brand put up, 2 tons were sold at 50 cents per half-kilo (about 9d. per lb.); whilst of the 7½ tons of "*Mignon*" brand, 12 cwt. were sold at 50 cents per half-kilo (about 9d per lb.).—*British Colonial Druggist*, April 8.

ADULTERATION OF FOOD AND DRUGS.—After a comparatively long sitting last evening the Municipal Commissioners managed to pass the report of the Committee recently appointed to consider the question of the adulteration of food and drugs in Madras. The proposal of the Committee, as we have already pointed out, is to introduce into the Madras Municipal Act a provision which already exists in the Calcutta Municipal Act. The opposition was wrong, and for the most part was confined to certain Commissioners representing "Bazaar" interests. What they lost in argument they sought to make up in tactics, and proposals for further adjournments were numerous, but were all rejected, and the Committee's recommendation was accordingly passed with a sensible amendment proposed by Mr. V. Desika Chary.—*Madras Mail*, May 3.

NEW TRADE IN PAPAIN.—The most approved method of preparing Papain is as follows:—1. The juice of the unripe fruit should be collected. 2. This juice should be mixed with twice its volume of rectified spirit. 3. The mixture should be allowed to stand for a few hours. 4. The insoluble matter should then be filtered off. 5. The residue should be dried at the ordinary atmospheric temperature. 6. After being powdered, Papain should be kept in well-stoppered bottles, ready for use.—*Indian Planters' Gazette*, April 30.

COPPERAH MARKET.—Since our last report on Wednesday, arrivals have been more plentiful than during the previous week, and prices are unsteady. On Saturday there was a downward tendency, and rates did not exceed R42 per candy. On Monday, the market opened with an advance of one rupee on the previous sales, and yesterday (May 3rd) was a jump of R1.25 and three boats were closed at R44.25 per candy. Today three boats arrived. Of these a parcel of a Negombo estate copperah fetched R44.50 per candy. The output is not sufficient to meet the demand at present. But dealers are holding pretty fair stocks in hand, which will soon be placed to the market.

CINCHONA BARK.—The *Indische Mercuur*, in a recent issue, contains a reply to what had been previously said in the *Arch. voor de Kinacultuur*. The latter paper had said that the depressed state of affairs in the bark market was caused by the owners of cinchona undertakings. These should not be so stupid as to lay out money in harvesting and sending large quantities of bark over before realising which the importers would have to wait an indefinite time. In reply to this it was pointed out that the cinchona planter cannot make the harvest smaller than nature has arranged, without spoiling plants, although he can improve it by certain timely operations. As a matter of fact, increase in exports over a normal harvest yield is often in direct consequence of low prices, because cinchona trees are then cut down because they do not pay.

COFFEE SCALE AND LADY-BIRDS.—We learn from proceedings of the Lower Palenys Association in *Planting Opinion* that Mr. Newport left on 28th Jan. last on his Mission to Australia. It was resolved that the Honorary Secretary write to Mr. Newport (a) That no consignments of Lady-birds be forwarded to India prior to Mr. Newport leaving Australia, but that he bring as large a consignment as possible with him. (b) The question of future consignments will be determined upon after Mr. Newport's report in India upon the success of the first consignments. He will, however, be requested to make all necessary arrangements, short of committing the Association to any expense or liability with regard to future consignments, so that if such be decided upon, they can be obtained upon such terms as arranged by Mr. Newport in Australia from Agents or persons willing to undertake the collection and forwarding of them to India. (c) The matter of Headquarters in India will be decided upon after Mr. Newport's return to this country. This being the most affected district, it is very desirable that Mr. Newport's Headquarters be in this district. Mr. Ramsay has put the Pillavally bungalow at Mr. Newport's disposal for this purpose. (d) That the sum collected for this business, including the contribution by Government, amounts to R7,530. This sum must under no circumstances be exceeded, and on all that is available to cover every expense in regard to this business, of whatever nature, R3 m have already been spent, leaving a balance is R3,547 available.

COTTON-SEED OIL when imported by manufacturers of butter-colouring to be used in their factories, is admitted to Canada free of duty.—*Chemist and Druggist*, April 9

CACAO ANALYSES.—We are pleased to understand that Mr. Cochran is likely to have an analysis made of the various parts of the cacao tree in accordance with the proposal of Mr. de Sanctis, sanctioned at last meeting of the Planters' Association.

COCA-LEAVES.—The London market is flat, fair Tinxilles being offered at 6d per lb. nominally. The following figures show the number of bales exported from Java during the last five years from January 1 to December 31:—

1897	1896	1895	1894	1893
1,105	1,046	1,371	731	—

—*Chemist and Druggist* April 16.

THE TEA INDUSTRY AND RETRENCHMENT.—“An Unfortunate Shareholder,” writing from London, sends us a call for retrenchment all round in respect of Tea Companies' onlay, not omitting the charges and fees of Agents and Directors. Certainly when dividends are below 5 or 6 per cent, and if there is no chance of improvement this year, consideration should be given to some, at least, of the suggestions made in this letter.

NEW AREAS OF CULTIVATION.—In the Matara District in 1897 are thus reported by Mr. Short:—

The extent added to the cultivated area of the district during 1897 may be put down as follows:

				Acres.
Tea	600
Citronella	500
Coconuts	300
Paddy	—
Other products	—
				—
Total				1,400

The actual extent of Crown land sold was 1,041 acres at an average price of R27 per acre.

THE WEST AUSTRALIAN PEARL FISHERIES are said to represent an export value of £7,000 a year. We read that there are about ten schooners, and ninety luggers engaged in the pearl industry, and employment is given to about 600 men afloat and 200 men on shore. During the past season about 400 tons of live mother-of-pearl shell have been raised, valued, say, at about £60,000, and pearls, the value of which it is nearly impossible to accurately obtain, have been found, valued, say, at £10,000. The West Australian Government receive a certain amount of revenue from licenses. Of course the fishery only lasts for a limited period each year.

PAINTING BRICKWORK RED.—First brush down the brickwork with a stiff bass dandy, and execute any necessary repairs or stopping with Roman (not Portland) cement; then apply a preliminary coat of smudge—odds and ends of colours and varnishes. Two coats of paint having a white-lead basis, say two tints of lead colour, or one white and one tinted red should follow, and then the final coat, which should be compounded with boiled oil, may be applied. To mix the red paint, take sufficient of the selected pigment ground to a paste in oil, and thoroughly incorporate boiled oil with it; then strain and use, adding a little turps to bring the colour to a working consistency. The boiled oil imparts body to the paint, which, being compounded of an iron pigment, lacks the body of a paint with a lead base; and to turps will tend to destroy the body it should be used sparingly. A little terebine should also be added as assist drying. Red pigment ground in oil can be obtained of various tints.

THE IMPERIAL DUTY ON TEA.

Our evening contemporary, a few days ago, made the reduction or rather abolition of the imperial duty on tea, the subject of a deliverance. Now although there is a home party in favour of "a free breakfast table," among practical financiers, total abolition of the tea duty is considered a very impolitic step, to be resisted to the last, and for this reason. When any trouble arises leading to financial pressure, such as a war threatened or it may be realized—and no one can feel safe against a great European War in these days—there is no levy more easily collected, or more certain in its results, and no war tax more universally applicable, than the Customs levy on tea. To destroy the machinery for such a collection therefore, say finance authorities, would be very unwise and should be resisted by any Government in power. If such be the common official sentiments of a few years ago, we may be sure they will not be mitigated at this time in the face of all the warlike disturbances facing the British Cabinet. Of course, there is no chance now of the subject being dealt with in the present Budget, although we should hope a good deal of support might be given to a motion in the House of Commons for the reduction (not abolition) of the tea-duty, in place of touching the levy on tobacco. It is a great pity, certainly, that a movement was not commenced in India and Ceylon six or more months ago for a substantial reduction in the imperial tea duty. That duty realized for 1897 on 231,395,778 lb. of tea at 4d per lb., the sum of £3,856,662. For 1898 we may count on the four millions sterling or a million for every penny of duty. Now a reduction of the duty to three-pence would be a substantial gain, and of course to two-pence still greater; but below 2d per lb. we do not believe the levy will be allowed to go. The resulting collection of two million pounds sterling is substantial in itself; but still more important is it as the nucleus of what may be, with the consent of the Commons, increased on any emergency into a universal and most easily collected war-tax. Now on the present occasion, for the coming year, Sir Michael Hicks-Beach had an estimated surplus of £1,786,000 to dispose of, but, along with an amelioration of the income-tax, he has given it mainly to the reduction of the duty on tobacco. Had British tea-growers made themselves heard in good time, in conjunction with a sympathetic party at home, it is quite possible that a 2d reduction in the tea duty might have got the first place. But the lesson certainly is, not to fail in agitation for this boon, or even the half of it, against the Budget of next year.

—♦—

WANTED FOR INDIA:—DEPARTMENTS OF AGRICULTURE, MANUFACTURES, AND COMMERCE.

The venerable Dr. Murdoch is indefatigable in trying to serve the people of India. He has just issued two letters—one to Lord Geo. Hamilton, Secretary of State for India, and the other to Mr. Samuel Smith, M.P.,—in the form of pamphlets. The object is explained in the appended summary embodied in a letter addressed to Newspaper Editors:—

Sir,—I beg to invite your attention to a Letter addressed to Mr. Samuel Smith, M.P., a Sequel to a

Letter to Lord George Hamilton, Secretary of State for India.

The Letter to Mr. Samuel Smith originated as follows:—

It was the general expectation, entertained by both political parties, that the British Government, following the precedent in the last Afghan war, would make a grant towards the recent heavy military expenditure on the frontier.

This was abandoned on account of the strong opposition of Sir James Westland, the Indian Finance Minister, who considered such a grant both unnecessary and impolitic.

During the Budget Debate the Hon. F. A. Nicholson, showed that Agriculture had been "starved," by the Indian Government; while proposals for its improvement and for the institution of Agricultural Banks were consigned by the Finance Minister to the limbo of "extremely desirable" but unattainable proposals.

Viewed on the light thrown, during the Budget Debate, upon the present very unsatisfactory state of things, it is suggested that the question of a Home Grant should be reconsidered.

The Letter to Mr. Samuel Smith advocates a grant on the grounds of Policy, Justice, and Humanity. It points out that two millions sterling might be most usefully spent on the following objects:—

1. Organizing a separate Department of Agriculture.
2. Organizing a separate Department of Manufactures and Commerce.
3. Organizing a system of advances to free ryots from the oppression of Money-lenders.
4. Organizing an Agency for the relief of Congested Districts.

The grant, it is true would provide only for the initiation of the proposed measures; it is shown how they might afterwards be supported by a redistribution of expenditure.

In the event of the Government of India declining to reconsider its decision, the Parliamentary Indian Committee are urged to bring the question before the British Public and move in the House of Commons for a grant. It is hoped, however, that this will be unnecessary.

The unanimous opinion of the Press would do much to secure the object in view. Your kind support is earnestly solicited. Yours faithfully, JOHN MURDOCH.

Dr. Murdoch is nothing if not practical: here is how he finally works out his scheme provided a home grant of two millions sterling for India is made:—

The AGRICULTURAL DEPARTMENT might be maintained by a third of the Famine Fund. It is better to prevent pauperism than merely to feed paupers.

The DEPARTMENT OF MANUFACTURES might receive a share of the allotment now devoted to "gridironing" the country with railways.

The ADVANCE DEPARTMENT should be self-supporting, but might be aided at first from the Famine Fund.

MASS EDUCATION on a large scale can be secured only by a reduction in the military expenditure. There are so many vested interests concerned, that this will be the hardest task before the Committee. But it should never be forgotten. The friends of India should never rest till its people are educated. It is true that this can only be gradually accomplished, but the rate of progress will depend upon its being constantly kept in view.

It is touching to note the final paragraph in the letter addressed to Mr. Smith:—

CLOSING WORDS.—With me the sands of life have almost run; with in a few months, if life be granted, I shall enter upon my eightieth year. It is my encouragement that India never had more or warmer friends than at present. Amid the din of party politics, her interests are not forgotten by you and others like-minded. Your efforts in the cause of Temperance are also highly appreciated. May you be wisely guided, and may an increasing blessing attend your efforts to benefit one-fifth of the human race!

TEA ESTATES AND PROSPECTS.

An experienced planter writes:—"I have been reading Wilson Smithett's report for 1897. It is a pity they do not give the yields for 1896 as well as 1897, so that one could judge if results of higher and lower prices were from finer plucking or the reverse:—

In 1897.			d.
Diyagama	In Agrads.	high goes down	.. 1½
Galaha	Medium	do	.. 1½
Yataderiya	Low	Higher by	.. ¾
Abbotsleigh	High	do	.. ¾
Badulla	Medium	Lower by	.. 1½
Campion	High	do	.. 1½
Elbodde	do	do	.. 1½
Mt. Vernon	do	Higherty	.. ¾
S. Leonards	do	Lower by	.. 1½
Talawakelley	do	Higher by	.. ¾
Densford	do	Lower by	.. 1½
Great Western	do	do	.. 1½
Ury	Medium	Higher by	.. 2½
Sheen	High	do	.. ¾
Wootton	do	Lower by	.. 1
Diyanelakelly	do	Higher by	.. 2
Mahagastotte	do	do	.. 1

"The general average is ¾d less, but certainly there is a more general tumble down on high estates than on *medium* or *low* except on one or two places. I do not see where the 'V. A. and Merchant' finds the large number of estates that are to shut up if prices go down a half-penny more in 1898. Many a shack old horse lasts longer than a gay prancing steed."—It is reported now that the "abandonment of a group" in Matale means the abandonment of certain fields of the group.

PRODUCE AND PLANTING.

THE BUDGET.—It was, of course, well known that the Chancellor of the Exchequer had a realised surplus upon the last financial year of over three and a half millions; but the public generally had come to the conclusion that the demands upon the public purse would be such as to leave no margin for the remission of taxation. Members of the House of Commons were therefore pleased to find that there is an estimated gross surplus for the year of a million and three quarters, which will, however, be diminished by the demands of Ireland and Scotland to about a million and a half. Large as the amount is it is not sufficient, such is our growing wealth, to cover the reduction of the Income-tax by one penny. Sir Michael Hicks Beach therefore directed his attention to the alleviation of indirect taxation. There are but four articles upon which revenue is raised on any considerable scale—beer, spirits, tea, and tobacco. The Chancellor of the Exchequer, therefore, had to choose between the claims of tea and tobacco. Scorning the "free breakfast table," Sir Michael's decision was in favour of tobacco, partly, he said, because the working up of the raw material gave employment to British and Irish industries, and partly because the duty had not been reduced for nearly sixty years. Sixpence a pound, therefore, will in future be saved to smokers, a 1d the consumers of other produce are left where they were.

THE OUTLOOK FOR TEA.—It has been urged as a mitigating circumstance of the present position of the Indian and Ceylon tea industry, suffering as it is from too much Government interference with the currency, that there is no inducement to extend the cultivation of tea. This, no doubt, is so, but apart from the restraining influence of the rising rupee we should have thought there were reasons why some check should be given to the desire for extending the area of tea cultivation. As lately pointed out in the statistics given by Messrs. Gow, Wilson, and Stanton, and emphasised by a correspondent in our issue of last week, the imports of Indian tea in relation to the deliveries are not such as to warrant an increasing area of tea cultivation, in the case of Ceylon tea the statistical posi-

tion is altogether different, due possibly to the forethought and enterprise of those interested, who have lost no opportunity of seeking new outlets for their produce and have not spared expense in the work of doing it. Our correspondent who pointed out the large increase in the stock of Indian tea to secure a portion of the London trade, the whole, or at least the larger share, of which it once held. We are quite aware that the difficulties in the way of the Chinese growers will be considerable. The market is in possession of the British grower, the public are accustomed to the flavour of Indian and Ceylon teas, and other points as well may be urged in their favour. Notwithstanding all this it is as well for Indian planters to bear in mind that this time their rivals mean business. The Chinese have hitherto neglected to equip themselves with machinery and up-to-date ideas. They appear to be about to put their tea-houses in order, and they also have acquired a considerable amount of experience. They are more formidable than they have ever been, and to crown all, thanks to the Indian Government, they are in a better position than ever they were to compete with India and Ceylon, owing to the artificially enhanced value of silver in the latter countries. It may be easier to assume that China tea is hopelessly beaten and that things will right themselves, new markets will be found, and the rest of it. But it will be wiser to look the position squarely in the face. In view of the coming struggle some relief must be found for the glut of tea which comes into London. New over deliveries as compared with the position two years ago dwell on the importance—nay the absolute necessity—of finding new markets for Indian tea. This warning has been preached for some years, but no special heed has been paid to it. Pessimistic forebodings are always unpleasant, and the voice crying in the wilderness is usually allowed to grow hoarse with lamentation. All the same it will be as well if tea planters in British dependencies bear in mind that they cannot expect to find the demand for their produce in the home markets expand indefinitely. To say nothing of minor matters, such as the boom in cocoa, there is the question of keen competition with the Far East, which is bound to come before long. China and Japan will soon be making supreme efforts to plant a firm foot in the tea markets of the world, and the former country will make strenuous efforts markets must be found and there must be no slacking of the spirit of enterprise. Moreover it will be very necessary to demonstrate to the Indian Government that the tea industry of India stands in danger of being throttled by the expedients now in force for inflating the currency, and that planters who are pursuing an active course of protest against the existing state of things are in no mood for tamely acquiescing in a policy which not only handicaps them, but benefits their commercial rivals in every way.

VERY PUSHING.—We do not know whether there are further possibilities in connection with the inducements offered by retail tea dealers to customers, but a pension scheme for widows is a fairly enterprising proposal. A Lincolnshire tea firm is offering "to every woman who shall have become a widow since Christmas, 1897, and who, since that date, shall have purchased not less than one half-pound of their tea per week for the last five consecutive weeks previously to her becoming a widow, 10s per week so long as she remains a widow; and to every woman who became a widow previously to Christmas, 1897, or previously to her commencing to purchase their tea, 10s per week as long as she remains a widow, provided that she shall have purchased half a pound of tea per week for ten years."

TEA IN THE ARMY.—Sir Herbert Kitchener, like Lord Wolseley, is a total abstainer, and he does his best to keep intoxicants out of the British camp. It is pointed out in a journal devoted to the advocacy of temperance that tea is in great favour with the troops in Egypt, that Tommy wins his Soudan battles on tea and coffee, and that tea is becoming increasingly popular in the Army.—*H. and C. Mail*, April 22.

RAMIE OR RHEA FIBRE GROWING IN CEYLON: A NEW AND PROMISING INDUSTRY.

Mr. MacDonald has returned fairly well satisfied from his inspection of the field of Ramie grown under the direction of Mr. Manley Power on the Pittiakande property of the Kurunegala Estates Company. In all some ten acres have been devoted to the fibre plant, and the growth and appearance so far have satisfied both Mr. Power and Mr. MacDonald. The latter brought to us specimen stems of a month's growth which in another fortnight would be quite fit for cutting. These are about 5 feet in length and half-inch diameter—very much smaller than the splendid stem we have had on show for a long time from the Colombo Garden of Mr. T. S. Clark. That big stem—8½ feet long and one inch in diameter,—Mr. MacDonald pronounces too old to be useful for fibre purposes. Pittiakande estate is situated between Kurunegala and Galagedera and—with an annual rainfall of 99 inches well-distributed, according to Mr. Manley Power,—is admirably adapted to grow Ramie, the soil being exceptionally good. But, for a proper experiment, this gentleman would recommend land which he can secure North of Kurunegala, only 1½ mile off the new line of railway and which he insists has good soil and an equally ample well-distributed rainfall, duly tested. Here 1,000 acres can be commanded, and 200 planted with Ramie, the minimum extent bargained for by Mr. MacDonald with reference to the application of his patent process of preparation. Mr. Manley Power staggered us with his faith in land North of Kurunegala in view of all the adverse reports we have received from practical planters, surveyors, and public works' officers; but it turns out that the land he recommends is within the ten miles radius of Kurunegala which covers the good land with adequate rainfall; and he quite agrees that beyond that limit the railway will run through a miserably poor and comparatively rainless country for many miles.

But to return to the Fibre plant, there can be no doubt that Ceylon stands much more in need of a new paying product now, than it did when Mr. MacDonald was here last; and that in view of the trial already given, it would be exceedingly interesting as well as beneficial, to have 200 acres planted and the industry fully tested with the patent process. To this end, it is indispensable that a Limited Company be formed, and indeed, all the preliminary steps were taken last year, the papers are all ready, only requiring that the shares should be taken up. But "there's the rub." Where is capital to be got for a new venture at this time of depression and dearth of money in Ceylon? The amount required may not be large and if distributed throughout our planting and mercantile community, it ought to be a trifling affair to compass, if only each prominent man interested in new products took a very few shares each. The case is one too, where we think special countenance and aid might be looked for from Government. For, here is an entirely new industry which, if successfully started, could not fail to benefit large districts in Ceylon. The South-western part of the island was long ago described as a very paradise for fibrous plants, and a demand for land as well as the resulting

employment of labour and circulation of capital would, of course, benefit the general revenue. The ordinary mode of seeking official aid would be to ask for a grant of the land required. But it is doubtful if the Crown has any land in the neighbourhood where it is desirable the experiment should be made, so suitable as that Mr. Manley Power describes. Failing land then, we would suggest a plan freely adopted in other Colonies to our knowledge—namely in Queensland, Natal, New Zealand—namely, the granting of a "bounty" on the first appreciable shipment—10, 20 or 50 tons of marketable fibre made by the Company, the quality of the fibre to be duly tested, and its value declared by competent, impartial judges. It will be for the Directors of the Company if formed to take this into consideration, and to define what sum in "bounty" should be asked from the Government. If granted, the fact would, no doubt, give additional confidence to the public in taking up the shares.

Meantime, we may mention that we continue to receive specimens of Ramie grown in different districts and some samples of prepared fibre: One gentleman in the South is especially enterprising in this way; but we regret to say that Mr. MacDonald condemns his samples as being both discoloured and decayed. We fear it is not likely indeed that fibre acceptable to the British manufacturers can be prepared, apart from the patent process. Today, Mr. Macdonald brought us samples (1) of the fibre as produced from the stem, (2) after treatment, (3) after being combed, and (4) as prepared for weaving, also of canvas and table cloth made from such fibre and all are extremely fine and strong. Of course a central factory could be established to serve a whole district of cultivators (on a small as well as big scale) who would bring their stems in to be treated. But that must follow after it is shown unmistakably that the 200 acres planted as described above, yield profitable results. We wish Mr. Manley Power and his supporters every success in organizing and floating the first Ramie Cultivation Limited Company in Ceylon, in the full hope that it may be a profitable investment for all concerned and the beginning of an important industry well adapted to extensive districts in certain provinces of the island.

COFFEE IN SOUTHERN INDIA.—The Onchterlony Valley, we are told by Mr. E. de Fonblanque in an interview with a contemporary, still yields as good crops as ever it did, whilst the trees are in splendid heart, and though leaf disease is present, the soil is so good, and the health of the trees so vigorous, that it does not seem to do any permanent harm. We are very much interested to hear that a hybrid between *arabica* and Liberian coffee has been discovered on Mr. de Fonblanque's estate, and that from it many plants have been raised, and a small clearing of it is about to be planted. A few seeds were, we believe, sent to the Peradeniya gardens, and we should like to hear how they are getting on. The hybrid is described as a robust variety of *arabica* producing a large bean, but with none of the coarseness of the Liberian. It has been said that the time will come when Ceylon planters will once more take to coffee planting. If so (adds our contemporary) they could not well set to work with a better variety than a hybrid of this sort.

CEYLON TEA ENTERPRIZE AND LIPTON
—HELP FOR CEYLON PLANTERS
FROM MOTHER COUNTRY—
COCONUTS, &c.
(By "Cosmopolite.")

LIPTON.

Many years ago, in fact as soon as Lipton purchased Downwal's estates, I began, in these notes, to warn planters against what he would likely cause the future to bring forth, but gradually he forged ahead with his schemes and overcame the scruples of the poor but honest planters, until, at last, they took him to their bosoms as the man who was to be the saviour of Ceylon and boomer of her teas. Now, in the *Overland Observer* of date 31st March, 1898, I read as follows:—"A Ceylon man in London says: 'Thus the man who has done more, in my opinion, than any other agency to spoil the tea industry from the planters' point of view, rides off with a huge fortune. In 1890 I wrote to you that I thought it a bad day for Ceylon the day Lipton arrived there, and there are many thinking the same thing today.' Now read what I said in the same paper several years ago:—"In these 'Odds and Ends' I have entreated my brother planters to keep the great pork, butter and tea vendor at a distance; that their worst enemy was the man who decried their wares by selling at 1s 7d a pound—and no higher price." Up to that time I had vainly striven to persuade my brother planters to 'ca eanny,' but, after that, I gave up in despair, and left them a prey to Lipton.

[But how could the brother-planters help themselves? And what about Lipton's pushing of tea in America and Russia? Let every man have his due!—ED. T.A.]

COCONUTS.

In the *Overland Observer* of same date, I read that the impression is gradually gaining ground that the main stand-by of Ceylon in the future must be Coconuts,—for Tea at present prices is not encouraging, and one more twist of the screw of exchange and profits will become losses. I left Ceylon when Tea began to reign, and poor King Coffee was quickly sinking into his grave; yet even when Tea was going ahead by leaps and bounds, I never fancied it, but always said that if I went back to Ceylon it would be as a Coconut Planter. I am sure if coconut estates had been as well attended to as coffee and tea estates have been, they would have paid as well, and been more lasting.

HELP FROM THE MOTHER COUNTRY.

In your leaders you darkly hint at a time, in the near future, when the planters of Ceylon may require help, as the planters of the West Indies have received. But does it not strike you as unfair that the agriculturists of Britain should be taxed to provide these planters with the means of tripping home, or up to the Nuwara Eliya Gymkhana, or to the festivities at Darravella, Kandy, &c. &c. The farmers at home, who have been called upon to pay towards the upkeep of the West Indian planters, are probably suffering more from depression than any other class of British subjects. They never are able to take sundry trips to London, or winter up the Nile, or have a six months' voyage to the East. It takes them all their time to make ends meet, and they have to stay at home to do that. But the pauper West Indian planters, who are not ashamed to take the money from those overtaxed farmers, are able to run home every few years, live for some months like fighting cocks, and then go

back to their estates to prepare for the next run home. I hope Ceylon planters won't turn paupers also, the home folk have enough to do to keep the West Indian candidates for the poor-house, without having a batch also in the East craving bucksheesh.

[Our hint was for Mr. Chamberlain as to aid—not from the imperial exchequer—but through reduced local taxation: reduced railway rates or abolition of the unfair tax on imported rice.—ED. T.A.]

THE GENIAL GEORGE.

Poor George Maitland's death appeared in last week's paper, and how many of the old planters must have cast their thoughts back when they read the notice. I first met him, early in 1865, in Kandy, and many a time did we mount to the top of Mutton-button together before breakfast, to get a puff of fresh air. When I was introduced to him and learned that he came also from the Silver City by the Sea, I paid him an unintentional compliment, by supposing that he was a co-temporary of my own, but he laughingly undeceived me by telling me that he was 13 years older than I. How young and fresh he looked, and, the last time I saw him, he was stepping along as jauntily as ever, and looked good for another 20 years at any rate. Of course the obituary notice about him in the *Aberdeen Free Press* was all wrong, for, in it, he is graphically described as having been 40 years a tea-planter in Ceylon. The paper makes no mention of the 13 years he spent in the Cape, in the Civil Service, nor the 20 years he labored as coffee-planter and visiting-agent. The paltry six or seven years which he spent as tea-planter is all that the paper takes notice of, and that period is lengthened out to 40 years, just to save time and trouble, and altogether regardless of accuracy!
Aberdeenshire, 21st April, 1898.

TEA AND TOBACCO.

Here is a vital passage from Sir M. Hicks-Beach's Budget speech:—

The list of articles on our tariff is now very small. I do not think it wise to reduce it, and therefore I do not think it wise to abolish any indirect taxation. (Hear, hear.) What are the four articles to which my proposition applies? First, beer; second, spirits; third, tea; and fourth, tobacco. I have waited vainly for some indication from the Committee as to which of those articles they would prefer to see relieved. (Laughter.) With a tea for the brewers, I must put aside beer. (Hear, hear," and laughter.) I hope hon. members below the gangway, opposite will pardon me if I also put aside spirits. ("Hear, hear," and laughter.) The choice, today, I think is between tea and tobacco. (Cries of "Tea" and counter-cries of "Tobacco," and general laughter.) Both are articles which are consumed by the people and especially by the poorer classes. (Hear, hear.) Both are very valuable stimulants when taken in moderation (laughter), especially by those who are insufficiently fed. Both are injurious when consumed to excess as, I am afraid, they are by a great many people. I can conceive myself listening to an alternate strain of poets, perhaps of different sexes—though I am not quite so sure of that at the present day—singing the respective merits of tea and tobacco. (Laughter.) There could be no more impartial nupture, for I am a total abstainer from both. (Loud laughter.) I claim that, like all total abstainers, as my solitary victor, but unlike some total abstainers, I am only anxious that the articles from which I abstain should be more and more consumed by everybody else. (Laughter.) On the whole, I give my vote in favour of tobacco. (Ministerial cheers and Opposition cries of "Oh" and laughter.) I do so for these two great reasons. Tobacco is not only an article of large consumption, but, imported

as it is to the extent, I think, of more than 70 million pounds, 95 per cent. of this importation gives most valuable employment to British and Irish industries. (Hear, hear.) In the second place, although no doubt the duty on tea is considerable in proportion to the value of the article, yet it has been frequently reduced to its present point. The tobacco duty has remained the same as now—3s 2d in the pound on unmanufactured tobacco—for a period of 56 years except during the short interval in which it was attempted to raise it by 4d. in the pound, an attempt which, I think, practically failed. (Hear, hear.) The tobacco duty is so high in proportion to the value of the article that I believe it actually increases the prime cost of the unmanufactured article by as much as 500 per cent. For these reasons I prefer tobacco. (Cheers.) I have a reason also with regard to the revenue. There is no doubt that the consumption of tobacco in the country is very great, and it is largely increasing, and, in spite of the high duty, I believe that the adulteration of tobacco has largely diminished.

CRITICISMS.

There were the usual criticisms of the Budget in the debate. The following are amusing:—

The selection of tobacco as a commodity to be relieved in preference to tea, Sir James Lowther approved, assuming that it was right to make any reduction, because if they were to reduce the tea duty materially a large mass of the population would have no inducement at all to counsel economy on the part of Parliament. This opinion, he explained, was formed quite impartially, for he was neither a smoker nor a tea drinker. (Laughter.)

Mr. Billson (Halifax) said he had no special complaint to make in regard to the reduction of the tobacco duty, but if he had to choose between tobacco and tea he should prefer to see the duty taken off tea rather than off tobacco.

Mr. Gibson Bowles congratulated the Chancellor of the Exchequer on the reception which his proposals met from the experts. As to tea and tobacco, he thought that an excellent choice had been made. Of the two vices, he considered the smoking of tobacco was much less injurious than the swilling of tea. ("Hear, hear," and laughter.)

PLANTING NOTES.

TEA CULTIVATION IN NORTH TRAVANCORE.—The Kanan Devan Hills Produce Company, Ltd. have now 8,750 acres of tea under cultivation. There are three "Chief Managers" on the spot,—Messrs. L. Davidson, W. Milne, and J. A. Hunter. [Mr. Hunter has not yet joined, being in charge of Sunnyroft, Kelani Valley, until Mr. Forsythe return in August.] Besides these there are 20 "Estate Managers" and 14 "Assistants" as also three Surveyors and Engineers and two Transport Agents. Full particulars will appear in our forthcoming Directory.

IMPROVED RICE-HUSKING MACHINERY.—A correspondent informs the *Rangoon Gazette* that "a gentleman from Ceylon is on a visit to Rangoon with the object of introducing new patent machinery into rice mills. The new machinery, according to his description, is wonderfully simple, only one floor being required for the one process by which the paddy is converted into white rice. He states that very much less rice is broken in the new machine, which occupies very little space, and the distributor attached to the machine separates and ejects the husk in one direction, the broken rice in another, and the coarse from the fine in the most perfect style. Besides, the same horse-power engine which a mill in Rangoon may now be using, will drive a number of these new mills, turning out fifty per cent more white rice than had hitherto been done. Also, fewer hands are required to these machines."—*Pioneer*, May 10

PLANTING PROGRESS IN THE STRAITS.—We extract from the report on the Kinta District for the year 1897, by Mr. R. D. Hewett, the District Magistrate, as follows:—

Agriculture is progressing satisfactorily, and large areas are under coffee and other crops, the best estates being those owned by Mr. Osborne, Messrs. Dykes and Leong Poo, Messrs. Ephraums and Crawford, Mr. W. Smith and Mr. Fu Chu Choon. Mr. Ogilvie has about 350 acres under coconuts and coffee on the Ipoh-Gopeng road, and many Malays, Chinese and others are planting coffee on small holdings all over the district, the best being those owned by Ngah Ali at Tambun and Sini Ismail, near Gopeng. The Dutch Mada Washab for the third time closed his dam at Pinji, which notwithstanding abnormally heavy rains which fell during the latter portion of the year shows no sign of giving way. Eight hundred and ninety-seven lots of agricultural land, measuring 5,912 acres 3 roods 23 poles, were alienated, so that up to the 31st December, 1877, four thousand nine hundred and six lots, measuring 18,463 acres 1 rood 34 poles, have been alienated.

FLORAL BEAUTIES OF DARJEELING.—A Darjeeling correspondent writes as follows to the *Englishman*:—The wind scorched and mercilessly shrivelled up the few remaining rhododendrons and magnolias, but, perchance, in a measure, spared the stately Iris, which has this year, above all years, unfolded her cool purple petals in dense banks of ravishing beauty. Surely a gladsome sight to the weary eyes of the dwellers in the plains calling up wistful memories of the distant Sister Isles. Even in these hills the Iris will not flower below an altitude of 5,000 feet. We would draw the attention of visitors to the Lloyd Botanical Gardens, which are well worth a visit. They are kept in most delightful order. The present is the season of the pansies, which, however, do not come up, either in size or in colouring, to those of last year, when they quite excelled themselves. The hot-houses are filled with a gorgeous array of cinerarias and calceolarias, of which one may become the happy possessor for a mere trifle. A wonderful blue wisteria, which droops in countless cerulean clusters from the roof, is alone worth a visit.

HOW TO PUSH LIBERIAN COFFEE.—This is Mr. Turing Mackenzie's scheme:—

First fix upon a field of action, and then concert a plan of campaign. I am inclined to believe that South Europe is worth a trial, and from what I have heard I would suggest commencing operations in Italy. [Poor Italy!—Ed. C.O.] The base of operations ought to be one of the many towns at which mail steamers frequently call.

(a) Let every 100 acres in bearing belonging to members of the Association contribute one pikul coffee free.

(b) Cost of transport to Europe to be borne by Planters' Association.

(c) This presentation coffee to be delivered free to the agent.

i. Provided he takes an equal quantity at a fixed price.

ii. That he guarantees to spend in advertising—say 25 per cent of the value of the pre-entation coffee.

iii. If in the second year his *paying order* doubles that of the first year, he is still entitled to receive the same amount of presentation coffee as he received in the first year.

In the third year of course he is supposed to be able to stand on his own legs, and the Association can move on to another town, that market having been captured.

COCONUT PRODUCTS AND THEIR
DISTRIBUTION:
LARGE INCREASE IN TRADE WITH
RUSSIA.

The upward tendency of copra, or the dried kernel of the coconut palm, the price of which is generally regulated by the price of coconut oil in London, has attracted attention for some weeks back, during which the ruling prices have been far in excess of those which the price of oil would indicate. The explanation is that there is a strong demand for copra for Russia, which has specially developed this year with the establishment of new Russian firms in Colombo. Germany had been a good customer of ours for the article for some time, and last year she took 42,878 cwt., out of a total of only 166,601 cwt. exported—Belgium coming next with 25,245 cwt. During the present year, however, the first four months show an exportation of no less than 93,753 cwt.,—increased to 100,253 cwt. by 10th May—and this promises almost a trebled demand for 1898. Of this quantity, 40,376 cwt. were taken by Russia, while Belgium comes next with 20,283 cwt.; and Germany has had to be content with the third place, with 14,001 cwt.! The United Kingdom took only 10,298 cwt., indicating, we suppose, that London is ceasing to be a distributing centre for copra (as well as for other of our products,) for continental needs. This comes among the revolutions which the Suez Canal has wrought, and is the fruit of the great development in colonial commercial enterprise on the continent, which the past few years have witnessed. We have nothing to complain of in regard to this result; for keener competition and a steady demand secure to the producer adequate returns for his labour, and must stimulate agricultural industry.

In reviewing the Export returns for 1897, early this year, we drew attention to the shifting of the Coconut Oil trade. The mother country, which was not only our largest customer for a long period, but practically our only customer for some time, took only last year about one-sixth of a by no means large outturn, and about 20,000 cwt. less than she had taken in 1896; and even America, which has been proving a good customer, took only 12,000 cwt. more than in the previous year, or about 16,000 cwt. more than the United Kingdom. India, on the other hand, imported almost twice as much as she did in 1896—that is about double the quantity shipped to America! Singapore, too, about doubled her demand, from 34,133 cwt. to 64,658, and was short of the United Kingdom by only 8,000 cwt. These figures indicate a great revolution in the oil trade; and if only our old customers, whose orders had slackened somewhat owing to the cheapness of tallow, resumed their former demands, we pointed out that there was the prospect of a rise in the price of oil, and with it of better prices for copra and nuts. Since we wrote in this sense, Russia has been coming forward in a remarkable way as a bidder for coconut products. There are evidently obstacles in the way of her taking oil from us; for last year, out of exports aggregating 409,609 cwt. Russia claimed only 299; and in 1896 she had but 81 cwt.; while this year, so far, there is a blank opposite her name. But, as we have seen, in copra she has taken the lead this year, with four times the quantity already that she took for the whole of last year; while in desiccated coconut in which she made a good show last year with

18,250 lb., she has taken nothing so far. It is to be hoped the trial shipments will lead to business. On the other hand, Russia has up to date taken 60,000 coconuts—of which we have been shipping immense quantities this year, nearly 3½ million nuts—as against 30,000 last year. Altogether, the outlook for the coconut industry, in connection with shipments to Russia, is decidedly hopeful, and should cheer the hearts of planters who were lamenting the fall in prices; as compared with three or four years ago. Those prices, running close during the short crops to R50 per thousand of nuts, may never come back, but growers will have little reason to complain if prices do not fall below those of last year.

In making special reference to the new business which Russia is doing—through enterprising firms, to whom we wish all success—with the Colony, we do not lose sight of the growth in tea purchases locally, apart from the business which is done through London. The direct shipments to Russia this year are nearly five times as great as they were for the corresponding part of last year, and even more than was taken during the whole of 1897! We regard these figures with satisfaction, not only for commercial reasons, but owing to their political significance; since nothing can be more helpful to a good understanding between the two great Euro-Asian Powers, than intimate commercial relations which should provide an added bulwark against war, with its dislocation of trade and possible ruin to lovers of peace, quite as much as to those who have to bear the brunt of battle.

THE GROWTH OF RAMIE.

A gentleman down South, who has experimented, writes:—

"As regards the growth of the plants from which my fibre is procured, it may be of interest to say they were originally given to me by Mr. Drieberg, of the Agricultural School, and planed out by me (3 × 3) in June last year. They were fenced in and protected from cattle and wild animals, but no further care or attention paid to them. As I was assured 'there was nothing in Ramie,' I did nothing until a few days ago, when I cut one plant and found it yield 50 stems, weighing (deprived of leaves) 7½ lb. Only 12 of the twigs weighed over 4 oz.* and these I decorticated and they yielded just over ½ ounce of fibre. This is equal to 35,000 lb. per acre for one cutting or over 25 tons per cutting. Mr. MacDonald estimates 'one acre of land should produce at least 70 tons of stems stripped from leaves.' N.B.—The bush I cut was a corner one, with nothing growing near it in two sides, so perhaps it was of extra size."

Great credit is due to the pioneers with this industry and to Mr. Manley Power in particular who has had the courage to plant an appreciable acreage, although he by no means accepts Mr. MacDonald's sanguine estimate as to continuous yield per acre per annum. Still he is convinced there is a thoroughly profitable margin and even if a Company be not started, Mr. Manley Power will probably go in for 100 acres. But nothing can be done now in clearing in his district till January next; and meantime the field of Ramie already formed is to be carefully attended to, cropped regularly and an exact record of results kept. This should form a valuable guide to future operations.

*Those cropped should average 6 oz. (Mr. MacDonald says—Cor.)

**THE HEAVIEST RAINFALL IN 24 HOURS:
NEDUNKENI AND ITS 31.72 INCHES.**

We direct attention to a very elaborate and interesting Report given below made by Mr. H. Parker, Irrigation Assistant, P. W. D. and Fellow of the Meteorological Society, on the subject of the extraordinary fall of rain during 24 hours in December last at Nedunkeni in the Northern Province. The Report is addressed to Government and the subject having been a good deal discussed in our columns, the document has been placed at our disposal. Mr. Parker affords evidence to show that the record was very carefully taken and is an accurate, reliable one, Nedunkeni being most likely on December 15th-16th last, the centre of a cyclonic storm. Mr. Parker's Report will prove of world-wide interest, especially to Meteorologists and their Societies in all civilized countries; for, as we have mentioned already, the number of cases on record, where more than 30 inches of rain has ever been recorded in any 24 hours, is extremely limited; and Nedunkeni and its last December's experience is likely to go down very prominently to posterity, while the occurrence will no doubt be freely discussed in scientific papers for some time to come.

ABNORMAL RAINFALL IN CEYLON:

**RAINFALL OF 31.72 INCHES IN 24 HOURS, AT
NEDUNKENI, N.P.**

FROM THE IRRIGATION ASSISTANT, C. I. BOARD,
TO THE DIRECTOR OF PUBLIC WORKS.

Nabirittawewa, 16th April 1898.

SIR,—My recent visit to the Northern Province has given me an opportunity of making some enquiries regarding the abnormal rainfall of last December at Nedunkeni, and I have the honor to submit the following report on it:—

Nedunkeni, eleven miles down the southern road to Mullaitivu, and 122 feet above sea-level, is a small village at which there is a dispensary, with quarters for the Medical Officer stationed there, and two small bungalows for the use of Revenue and Public Works officials when travelling. It is a little to the east of the dividing ridge of North-Central Ceylon, and though itself in the catchment area of the eastern Per Aru, which flows through Tannir Marippu Tank, it is only a little to the south-west of the point where three separate drainages meet. Forest, containing a thick growth of high trees, extends over the neighbourhood, and more especially for many miles from the south to the east,

3. The staff at the dispensary consists of a Medical Officer, a dispenser, and an hospital orderly. For about three years, a rain-gauge has been established in the grounds of the dispensary, and its records are regularly transmitted to the Public Works Office, and are published among the rainfall returns.

4. I annex a sketch showing the position of the rain gauge, the dispensary buildings, and the nearest trees.

5. Although the mean annual rainfall at Nedunkeni is probably little more than 60 inches, the fall for last December was 67.07 inches, and of this amount 31.72 inches were measured at 9.30 a.m. on December 16th, as the rainfall of the preceding 24 hours. Unprecedented floods were caused by it throughout this part of the district, and 162 tanks were breached by the water which poured over their embankments, while water passed from 18 inches to 2 feet 6 inches deep over the bridges on the northern road to Mullaitivu.

6. The only rainfalls above 15 inches previously recorded in Ceylon according to the last published Annual Returns (for 1896) have been 18.75 inches, on December 14-15, 1896, at St. Martin's estate, Rangalla,

Central Province, 3,600 feet above the sea level, with an annual mean fall of 173.56 inches, as entered in the Return of the Surveyor-General; and the following amounts entered in the Public Works Department Return:—

	Feet above sea-level.	Max: Rainfall in inches.	Date.
Devilanc, E.P.	136	19.50	Sept. 8-9, 1884
Padupola, C.P.	1,636	18.80	Sept. 8-9, 1872
Ambare, E.P.	65	18.50	Jan. 15-16, 1876
Avissawella, Sub.	105	17.90	Oct. 15-16, 1893
Tenepitiya, N.W.P.	9	17.60	Oct. 19 20, 1891
Ambanpitiya, Sub.	729	16.65	Aug. 6 7, 1886

The accuracy of these last records of rainfalls has not been investigated, and it is quite uncertain to what extent they can be accepted. So far as Ambare is concerned the method of measuring the rainfall that was in practice when I visited that tank last year was so rough as to render valueless any high measurements obtained there.

7. The gauge at Nedunkeni is fixed on a plot of short thick grass inside the dispensary enclosure. Its top, 5 inches in diameter, is 2 feet above the ground, and the mouth of the funnel has a vertical rim 2 in. high. The bottle will hold a rainfall of 4½ inches, and is completely enclosed in a water tight receptacle, in which any surplus rain collects when the bottle overflows. The rainfall is measured in an ordinary graduated half inch measuring glass.

8. The rainfall of December 15th began at Nedunkeni at about 6 o'clock in the morning, and continued without intermission until some time on the following day. That which fell before 9.30 a.m. on the 15th was entered as usual to the previous day's account. At noon, at 3 p.m., and at 6.30 p.m. the bottle in which the rain was collected was emptied into an ordinary wash-hand basin by the Medical Officer or the Dispenser, having overflowed into the receptacle at 3 p.m. (this water also being emptied), and being full at the other times. The orderly states that during the night, acting on instructions given in the evening by the Medical Officer, he emptied it twice. On the first occasion it had overflowed, and all the water was poured into the basin, which was then nearly full. On the second occasion, the bottle was full, and he poured the water into the ewer belonging to the wash-hand set, after first examining the latter to see that it was empty. At about 7 or 7.30 a.m. on the 16th, the Dispenser emptied the bottle into the ewer, and again at 9.30 a.m., when it was about seven-eighths full. The whole of the water was then measured by the Dispenser, in the presence of the Medical Officer and the orderly. The Medical Officer is now stationed at Mankulam; the account that he gave me there agreed with that of the dispenser and orderly.

[Here Mr. Parker gives a sketch of the station, to show the situation of the rain-gauge.—Ed. T.A.]

9. By a fortunate accident, this rainfall has occurred at a station where there is the check of a quite unusual number of observers. Practically the only doubt that can be felt with regard to the all-important check of the number of times the bottle was emptied is with reference to the statement of the hospital orderly that he went out twice in the night to examine and bring it to the house. With respect to this it may be noted that the intensity of the rain from 9.30 a.m. to 6.30 p.m. on the 15th, was almost exactly 1½ inch per hour. The Medical Officer informed me that heavy rain continued up to about 8 p.m., after which it became lighter. According to the hospital orderly's evidence, we have for the next 13 hours after 6.30 p.m., an intensity of a trifle more than 1 inch per hour, and this is only about two-thirds of the intensity of the succeeding 2 hours up to 9.30 a.m. on the 16th. There is therefore no evidence that the statement of the orderly is untrustworthy; on the contrary, it closely agrees with the actual measurement made on the 16th by the dispenser and the Medical Officer. If we accept his statement, a total of 6½ bottles has been accounted for; this would be about 31 inches, or

0.27 inches less than the measurement, this balance being the water that had overflowed from the bottle.

10. Thus, so far as the recorded measurements go they may be accepted as correct. Whether they represent the actual rainfall is another matter. There are other possible causes of error to be considered:—

(a). Splashing, caused by rain drops falling on ground covered by a film of water. It is possible that during the greatest intensity of the fall there may have been some slight splashing into the funnel of the gauge; but the protection afforded by the grass, and the height of the mouth of the gauge above the ground level could not but prevent this from being of importance.

(b). The presence of tall trees on the windward side of the gauge is a much more serious cause of error. While part of the heaviest rain was falling, a wind, described as "moderate" here in this forest, but "strong," at Kanukent tank, 11 miles away to the north-east, was blowing from the west, and veering round to the south-west, in which directions 2 leafy trees, 93 feet high, are so near as certainly to intercept a considerable quantity of rain if it fell at an inclination even much steeper than 45 degrees. It is impossible to even guess the loss from this cause; but it may safely be asserted that there must have been some, and that possibly it was considerable.

(c). The loss of rainfall while the bottle and receptacle were removed in order to be emptied. This cannot be estimated; its total amount must have been very small.

11. My general conclusion is that most probably the actual rainfall was in excess of the recorded amount.

12. The only unusual circumstance connected with this rainfall is its steady continuance for so long a period; and with regard to this fact the independent testimony of Mr. Samugam, the District Engineer, and of villagers at Kodalikkalla, 7 miles to the north east is confirmatory. According to Mr. Samugam, the rain began at Kanukent tank at about noon on the 15th, and lasted until afternoon on the 16th December. I have myself at the Deduru Oya works measured an intensity of $1\frac{1}{2}$ inches per hour for 5 consecutive hours.

13. At Kanukent there is the evidence of the District Engineer, Mr. Samugam, at Kodalikkalla, that of the villagers, at Nedunkeni, that of the Medical Officer and dispenser, that the heavy rain set in from the west. Towards evening the wind was blowing from the south, and on the following morning from the north-east, from which direction the wind was also recorded on the 15th morning at 9-30 a.m. Thus the storm was clearly cyclonic, as was to be expected, and the centre of the depression must have worked round from the north to the west of Nedunkeni. Regarding its earlier and later movements nothing is known.—I am sir, your obedient servant,

(Signed) H. PARKER,

Irrigation Assistant, F. R. Met., Soc., &c.

OUR PRINCIPAL TEA COMPANIES.

In the *Ceylon Observer* and *Tropical Agriculturist*, will be found full reports from our own representative of the proceedings at the annual meetings of the Ceylon Tea Plantations, and Eastern Produce and Estates Companies. The Chairman of the former, Mr. H. K. Rutherford, never fails to have useful information to impart in his annual deliverance, and the present occasion is no exception to the rule. He shows us how each penny up or down in exchange means £150,000 into, or out of, the pockets of the Ceylon tea planters; and that from this cause alone last year gave £250,000 less profit than 1895—when exchange was specially favourable. Then the Indian famine and dear rice made a difference last year of £109,000; while the lower price of tea, $\frac{3}{4}$ per lb lower last year than in 1895, lessened the profits by £360,000—thus giving an aggregate loss to our tea industry of no less than £710,000 or equal to £2-5s per acre of tea in bearing. Is it any wonder after such a result, that

there should be more than talk about abandonment, more specially considering the area that, probably even in 1895 did not earn £2-5s per acre? For the future, Mr. Rutherford is hopeful: he thinks we have seen the worst; but that manifestly depends on the decision of the Currency Committee, while such elements as Plague and War must also be taken into account as possibly interfering with the profits of the industry. No Company, however, occupies a stronger position than that of the "Ceylon Tea Plantations" and both Messrs. Rutherford and Talbot were enabled to speak with confidence as to its future. The latter has come to believe in artificial manuring to a certain extent, while the evidence afforded of the coconut investments proving satisfactory, is very re-assuring.

Mr. Lindsay-Nicholson represented even more extensive interests as Chairman of the meeting of shareholders in the Eastern Produce and Estates Company; but with a heavy burden of debentures, the ordinary shareholders here, are glad to have less than half the dividend of their more fortunate neighbours. We think the Chairman was too sanguine in anticipating the total abolition of the tea duty next year. Apart from the possibility of war (which would mean an increased duty), the most that can be anticipated, we think, is a reduction to twopence a lb. which would still leave a collection of revenue exceeding two millions sterling. Mr. Lindsay-Nicholson did justice to the Ceylon staff, and their duties will be better understood in view of the figures given by the Managing Director showing that 14,500,000 lb. of tea—or one-eighth of our entire crop—represented the Company's Agency business last year! Mr. Cameron very properly dwelt on the great importance of developing the trade in our teas outside the United Kingdom and more especially in Russia and America, to which he favours direct shipments from Ceylon.

The other two Companies whose proceedings are reported—the Highland and Poonagalla—are, of comparatively minor importance; but Sir George Pilkington well shewed how much the spirit of "economic working" had entered into the minds of Directors in devising wire shoots and one convenient, common factory for the Poonagalla group, in order to save labour. Sir George spoke out on the Currency question and no less so on the bad policy of planters shipping home large quantities of inferior tea. Everywhere at present, one blessing is recognised as arising out of the trouble of "hard times" and that is the check which has been, and must be, given to the planting of further areas with tea.

THE COPPERAH MARKET.—Since our last report prices have been very unsteady, while the arrivals were few and there was keen competition. Monday opened with rates closing at R48-50 for fairly dried, on Tuesday the market moved to R49, and on Wednesday it stood easy at that price. On Thursday there was a jump of one Rupee and an estate parcel of 61 candies was closed at R60. On Friday there was much uneasiness and closing rates stood at R53-25 per candy, with an advance of R3-25 on the previous day's prices. This was an unprecedented jump, due more to the fact that a shipment for Odessa had to be closed, than to an actual upward move in the European market. Today there was a still further rise of fifty cents, and next week it is believed, will open with a slump in the market. According to day's private advices, there is a downward tendency in prices in the London market, with which local sympathy will before long be evinced.—Local "Examiner," May 14.

COCONUT ESTATE PROPERTY IN THE NORTH AND EAST OF CEYLON.

If it be true as stated by the "Hindu Organ" that Mr. R. M. R. A. Supramanian Chetty has for two lakhs of rupees acquired four estates—Kotta, Karambogan, Kanagarayan and Serampattoo—belonging to the estate of the late David Todd, it shows that coconut property is not very highly valued in the North. We make out that there must be about 1,000 acres covered with coconut-palms on these properties, and the price mentioned would therefore only average about R200 an acre: can there have been a mortgage besides?

The Popallai estate (of 1,500 acres—1,000 planted with coco-palms) has been leased from Mr. E. S. W. Senathirajah and others by Mr. J. Russell Lilley who has sent his nephew, Mr. H. E. Candy to manage the same.

In the Eastern Province besides his interest in several commercial ventures, Mr. Russell Lilley owns 107 acres of coconuts at Tirrukovil, while he also superintends 359 acres belonging to Messrs. Scott and Tatham at Kalkudah. Another Kalkudah property is that belonging to the Agra Tea Estate Co. of 300 acres under the care of Mr. A. E. Byrde. And once again of new estates we have the Tirrukovil property of Messrs. Scott and Tatham, 1,000 acres, of which 650 are planted, under the care of Mr. C. E. Northcote. Altogether about 1,500 acres have recently been added to the coconut palm area in the Eastern Province. We hope the plantations may all turn out well; and that success may also attend the operations of the Carnac Mill Co., and the local Steam Navigation Company—both new ventures at Batticaloa.

BRITISH-GROWN TEA.

We quote the following article and letter from the *Financial Times* :—

Owing to the fall in the prices of Indian and Ceylon tea, and the maintenance of the artificial rates of exchange on India, the dividends on last year's workings of tea-planting companies are likely to be on a much smaller scale than those of previous years, except in those cases where there are reserve funds for equalising dividends. From information we have received, we believe the remedy for the present depressed state of the tea market is entirely in the hands of the companies themselves. As combinations are now the order of the day, we do not see why they could not advantageously combine to diminish the output of the lower grades of common tea, which, it seems, do not pay to produce at present low prices. We are told that when the prices of common tea were much higher than they are now owners of estates in the low-lying districts, both in India and Ceylon, adopted the system of plucking one leaf more than was gathered in the higher districts for the purpose of compensating themselves by quantity for comparative inferiority of quality. It appears that this method of working low estates answered very well as long as prices of the grades obtained from the manufacture of the extra leaf were remunerative: but now the production of these grades has become unprofitable, and it is suggested that all tea companies who own estates on which the coarser plucking is practised should agree to discontinue it for a defined period. We learn that this can be done without the slightest interference with the ordinary working of the estates, and though it may increase the cost of the better grades of the tea produced on these estates, the advance in prices of all qualities which would follow from the decreased supply would more than compensate for the small increase in the cost of production. The fact is, as statistics prove, the production and

consumption of the British-grown tea are so nearly equalised that an increase in consumption, which may naturally be looked for from present low prices, or a decrease in the supply would cause an appreciable reaction in market values. As the first is a slow process, the quickest and most certain way of obtaining the desired improvement would be to discontinue the supply of those grades which are now selling at from 4d to 5d per pound in bond and which consumers do not want. There can be little doubt that if proprietors of estates would agree to leave the fourth leaf on their bushes such a reduction in the supply of tea would take place as would enhance prices of all qualities to a point that would satisfy them, and at the same time not be high enough to discourage consumption, though it would probably curtail the profits of the big retailers, who can well afford it. However practicable and advantageous the plan of adopting temporarily the system of finer plucking may be, it would not do to carry it too far. If that is done, it will probably let in again large quantities of Chinese common Congon, the importation of which for the last eighteen months the English Government has been striving to increase by giving it a protection of at least 40 per cent. over British grown tea. The reason why this protection of China and Japan tea did not lead to increased imports last year is because consumers fully recognise the comparative cheapness and better qualities of British machine-made tea, and no longer appreciate the peculiar and distinctive flavour China tea acquires from being manufactured by the clammy hands of Chinese coolies. Still, it is very difficult to compete with a highly protected article, and we therefore warn British tea planters to watch Chinese exports next season and the vagaries of our own Government.

SIR,—My attention has been called to a leading article, under the above heading, in your issue of this date, on the contents of which, however, I crave your indulgence to make a few remarks.

1. Profits for Season 1897.—While you are correct in the view that these, owing to high exchange and overhead low prices of tea, are likely to be curtailed, it is hardly correct to opine that "dividends will" all round, "be on a much smaller scale," to use your own words. Undoubt'edly, the dividends of those companies which in past favourable seasons have made no provision for "a rainy day" will have to be reduced, but in the larger number of instances, where reasonable provision of this sort has been made, there is not likely to be much diminution in actual dividends, though the profit earned may be less. The three principal Ceylon companies which have so far issued their reports—namely, the Ceylon Tea Plantations Company, the Standard Company, and the Eastern Produce Company—certainly show small signs of decadence (despite an unfavourable season), and they cannot fail to be most satisfactory to their shareholders; while, among the leading Indian companies—with a few exceptions (where conditions have been unusually unfavourable)—there is not likely to be much cutting down.

2. Quantity v. Quality of Produce.—While there is no doubt some truth in what you say as regards managers having it in their power to control the quality by regulation plucking, this is not always practicable, being chiefly questions of labour and of climatic conditions ruling at different periods of the producing (flushing) season, which extends over nine months of the year. The constant endeavour now-a-days, both of managers on the spot and of the home administrations of most of the leading companies, is to produce the best possible quality of tea. During the year just closed, however, conditions have been, in India especially, most abnormal, weather being frequently unfavourable and the health of the labour force bad, with heavy death-rolls, and this is the chief reason of the coarse quality produced. This will probably be entirely reversed next season. Indeed, there are not wanting those who believe that there is some fear of an excessive supply, during 1898, of fine

grade tea, which may cause a fall in the price of fine Assams. It should be noted, moreover, that there have been, even in 1897, many notable exceptions of gardens—where conditions were more favourable—sending very fine tea, notably the Assam Company, Doom Dooma, and Jhanzie in Assam, and the Lebong and other Darjeeling gardens.

3. Low-lying Districts.—You appear to have fallen a little into error in regard to this point. It is true that in Ceylon—where the best tea is grown at an elevation of from 1,000 up to 4,000 or 5,000 ft.—the produce of the districts lying at sea level is mostly poor, and the same remark applies to the produce of the so-called beels or marshes in Cachar and Sylhet. But as regards Assam—that is, the whole valley of the Brahmapootra—which produces the strongest teas, and also parts of Sylhet, and even the Dooars, virtually the whole tea-planted area is only a few feet above river level, with no deleterious effect on quality, but the reverse.

4. Return of Chinese Competition.—You are quite correct, no doubt, in the view that any attempt to unduly raise the price of Indian and Ceylon tea, or to seriously diminish the supply of the less highly-priced grades, might possibly give a renewed impetus to the cheap China-Congou import. This, however, I believe is less to be feared, so far as home consumption is concerned, than by reason of its standing in the way of, or handicapping, the export trade to Colonial and foreign countries, in which direction, much more than to increase consumption in Great Britain itself, the expansion in consumption, and counteractive of over-production, of Indian and Ceylon tea is mainly to be sought.—I am, &c.,

GEO. SETON.

Indian Tea Share Exchange, 120, Bishopsgate Street Within, E.C., April 16, 1898.—*H. and C. Mail*, April 22.

PARA RUBBER GROWING:

THE COMING INDUSTRY FOR CEYLON.

"Is it to be Para Rubber or Ramie Fibre," may well be a question asked by the puzzled planter anxious to have two strings to his bow; and we suspect the information published now will send a good many more customers after Rubber seed. We were aware of the wonderful progress made on Culloden estate when we took exception to a statement about good seed being unavailable save from our Government Gardens. The following report published in the *Ceylon Government Gazette* will shew what the Director of the Gardens has now to say on the subject:—

Royal Botanic Gardens, Peradeniya, April 14, 1898

The Hon'ble the Colonial Secretary,

SIR,—I have the honour to report that during the week ended April 2d last, I visited the plantations of Para indiarubber at Edangoda and Yattipowa made in 1890-93 by the Forest Department, and also some of the estates near Neboda, on which a considerable amount of rubber has been planted.

2. The plantations belonging to the Forest Department are in very good order, and in a year or two many of the trees will be in condition to allow of experiments in tapping being made on them, as is much to be desired.

3. On Culloden estate near Neboda, which I have examined in most detail, thanks to the courtesy of the visiting agent, Mr. Grigson, there are about 30,000 or more trees in very fine order. The older trees were grown from seed or cuttings obtained from Henaratgoda garden. Of recent years the estate has had much seed of its own, and this year their crop is expected to greatly exceed that at the disposal of Government.

4. A finer lot of trees than those on this estate and the neighboring estates it would be difficult to find. The oldest trees are only fourteen years old, but rival the trees twenty-one years old at Henaratgoda,

This is partly due to the fact that the Culloden trees are more widely separated than those at Henaratgoda, being planted among tea at distances of about 30 feet, partly to the more favourable soil and conditions of the Kalutara district:

5. A few experimental tappings have been made on the older trees on this estate and have shown very good results, better than those obtained at Henaratgoda, on which the data of profit and loss given in the circular recently issued by this Department were based. As at present the demand for seed makes it more profitable to keep the trees for seed, these experiments are not being continued just now.

6. From what I saw of the condition of the trees and the results of these tappings, I am strongly confirmed in my previous opinion that the cultivation of rubber bids fair to prove a profitable industry in Ceylon and a useful adjunct to the larger industry of tea and cocout cultivation.—I am, &c.,

JOHN C. WILLIS, Director.

Simultaneously we receive from the Resident-General of the Federated Malay States, a copy of the very interesting and practical Report furnished by Mr. Derry, the main portion of which we published some time ago, but which we reproduce as follows, so that planters may at once be able to refer to it in full:—

Government Plantations Office.

Taiping, 24th Nov. 1897.

To the Secretary to Government, Perak,

Sir,—In reply to S.G. 61 64-97, I have the honour to forward the following report on the work done in connection with Para rubber trees at Kuala Kangsar.

2. Some months ago the Director of Kew wrote to me. He had heard from Sir Hugh Low that the Kuala Kangsar trees did not exude when tapped, and asked, with a view to information, for the reason.

3. It will be seen from this report that the work for the year is not yet completed, and I would particularly point out that the experiments have not been conducted to test how much each tree will yield, for the reason that these trees are of much greater value to the Government at the present time as seed-bearers than rubber-producers: as an instance of this, I would mention that applications for 70,000 seeds have been received for the current year (of which 25,000 have been supplied) and an application filed for 100,000 seeds next year.

4. The Para rubber trees (*Hevea Braziliensis*) at Kuala Kangsar were first tapped during the month of August, and the work has been proceeding up to the present time. The frequent wet days have delayed the work considerably. At the end of October, 60 trees had been tapped and 88 of dry marketable rubber prepared. Most of the trees tapped were six years old, and from these trees an average of 10 ozs. of dry rubber has been obtained. A few trees, 12 years old, produced 3 lb. each, but in no instance were the tappings exhaustive. Two samples have been sent to Mining Lane for opinion and valuation.

5. Tapping.—The trees were tapped with almost V shaped cuts, a few inches apart, with a channel down the centre from the lower branches to the base. An ordinary pruning knife was used to make the first cuts, and about a quarter of the outer bark removed, care being taken not to cut too deeply. So soon as this commenced to callous—which varies from two to several days—the edges of the cuts were lightly shaved with a very sharp chisel every day with an occasional interval until the decided quantity has been exuded. The rubber was collected in locally-made tin boxes, 6" x 4" x 2", nailed at the base of the tree, with the lid partially opened so as to prevent wet or dirt from falling in. When full, this was allowed to dry and the water pressed out (a pinch of salt appears to expedite the coagulation) and then kept in smoke for about a week to prevent mildew.

6. Time of Tapping.—Para rubber has a short resting season when most of the leaves fall off. The flowers usually appear first, and when the tree is in full foliage tapping can be commenced and carried on with different trees—until again deciduous. The first cuts can be made at any time of the day and may be left for weeks in the event of exceptionally wet weather, but the subsequent tappings should always be done in the evenings as the rubber soon ceased to exude with the influence of the sun.

7. Planting.—Most of the trees at Kuala Kangsar are planted on wet land, subject to be flooded every year. Some, however, are on high dry land, but my experiments are not sufficiently complete to say if there is any difference in the yield of rubber on dry, against wet, land.

8. The tree appears to be the most adaptable of any rubber tree, growing from swampy lands to an elevation of several hundred feet, and seems to thrive on any ordinary soil. The material point in its cultivation is close planting. I recommend not more than 15 feet apart.

9. Remarks.—I am of opinion that a tree 5 6 years old is capable of producing 12 lb. and a tree 13 years old 5 lb. of rubber without injury. The cost of tapping, drying, and preparing, I should estimate, working on a large scale, about 30 cents per lb. The present London value for dry rubber is from 3s 6d to 3s 8d (sterling) per lb. I would add that I shall be able to offer some further remarks when my experiments are completed, and when I receive an opinion on the samples sent home.—I have, etc., R. DERRY, Superintendent of Government Gardens.

38, Mincing Lane, E.C., 19th Nov. 1897.

To R. Derry, Dear Sir,—I have received your samples of Para rubber and beg to report on same as follows:—

No. 1. Matta Grossa in character, fairly clear, imperfectly smoked, but apparently good, strong rubber, * No. 2. Do. do. do. slightly preferable, Value 2s 9d to 3s per lb.

The market is very good and you should ship all you can, try and smoke it a little more and keep the bulk up to the standard you sent me. As a rule the rubber from the Straits is much inferior to that coming from South America, but your samples are quite equal to Para. You seem to have more carefully prepared it, ordinary Straits rubber, imperfectly collected and prepared, is worth about 1s per lb. less than the samples you have sent.

I hope to do fairly well for you in the pepper, the market keeps good.—Yours, etc., W. FIGG, for W. J. & H. THOMPSON.

A crop of 100,000 lb. of rubber from the Culloden trees to sell at even 2s 6d per lb. (£12,500) is not to be despised!—It is our intention very shortly to issue a new edition of our manual "All about Rubber-growing, &c.," and to bring the information up to date, so far as we can collect it from official reports and from private planting experience made available to us.

CACAO ANALYSES.

Mr. De Sanctis and other gentlemen interested in this subject will be glad to learn that we have this day found papers that have been sought for during several weeks, giving very elaborate analyses of cacao soils, pods, various part of fruit (of different varieties—specially Forastero) of kernels dried and fermented, of the pulp, etc., etc. And also reports of a series of experiments with manure in cacao plots. Can our readers guess where these very extensive analyses have taken place? In the "Government Laboratory British Guiana"!

* Prepared with a pinch of salt.

So, a second-rate Colony like Sir James Longden's "Demerara," can afford a Government Laboratory for many years back; while the first of Crown Colonies has nothing of the kind!

We are sending on the analyses and other information to Mr. Cochran to aid him in his present researches. We hope afterwards to embody all the material parts in an up-to-date Cacao Planters' Manual.

CEYLON TEA COMPANY MEETINGS.

CEYLON TEA PLANTATIONS COMPANY, LTD.

(From our own Reporter.)

The annual general meeting of shareholders in the Ceylon Tea Plantations Company, Limited, was held at the offices, 20 Eastcheap, London, on Wednesday, April 27. Mr. H. K. Rutherford presided over a large gathering, being supported by Messrs. David Reid, H. Todd and G. Talbot, directors.

The SECRETARY, Sir Wm. Johnston, read the notice convening the meeting,

The CHAIRMAN:—As the report and accounts have been in your hands for some time, I presume it is your pleasure that they, as usual, be taken as read. Many shareholders doubtless have been somewhat anxious to see the kind of accounts and report this Company would present for 1897, as on all sides you must have heard that Ceylon and Indian Tea Companies generally have had a disappointing year. Well, I dare say it was a relief to you to see that, notwithstanding the many adverse conditions under which the enterprise suffered, your Company has done well. We have made a profit of £42,199 3s 0d, and are in a position to comfortably pay the usual 15 per cent dividend for the eleventh year in succession, to add to reserve £5,000, to write off for depreciation £5,000, and to carry forward £3,121 10s 9d to next year (apause.) Although we have no reason to complain of these results, still, speaking generally, the tea industry of Ceylon has had its first shock in the year that has gone, and as you have been told in the report that the lessened profits have arisen from the rise in exchange, the loss in supplying rice to the coolies and fall in the price of tea, it will, I am sure, be interesting to you to understand the bearing these factors have on the industry as a whole and also to what extent they affect your Company in particular. In the year

1895, the conditions with regard to exchange, rice, and price of tea were considered fairly satisfactory by growers, and a comparison between that year and 1897 will show you how adversely our interests have been affected by these causes alone. First, then, with regard to exchange, the Ceylon crops for 1897 was 116,000,000 lb. of tea, which roughly cost £30,000,000 to produce, so that had the favourable rate of 1895 continued the planters of Ceylon would have had £250,000 more profit from this item. It is presumed we now know the worst about the rupee. There is still, however, some hope of the Indian Government taking the producer's views into consideration and fixing the rupee at a lower value than 1s 4d. As every 1d in exchange means a difference of £150,000 to the Ceylon tea growers on the current year's crop it is to be hoped that some relief will be afforded the enterprise in whatever steps the Government may take with regard to the silver currency question. Had the Indian famine not taken place and the price of rice (the staple food of our coolies) remained the same as it was in 1895, the tea planters of the colony would last year have been better off by £100,000. It is a matter for satisfaction that Indian famines do not come more frequently as dear food means a higher cost of production for our tea. The sale price of Ceylon tea for 1897 was 3d per lb. below that of 1895, so that from this cause there was a loss of £360,000. These three items represent a total loss to the tea growers of Ceylon of £710,000 arising from the difference of conditions existing last year as compared with those of 1895. This is equivalent to a drop of 1½d per lb. on the tea produced, or a loss of profit of about £2 5s 0d per acre on the lands under tea. To this Company the loss arising from the difference in conditions obtaining in 1897 as against 1895 has been £17,000, and this notwithstanding our teas only fell 3d per lb. in price as against a drop of 3d per lb. for Ceylon tea generally. The steady drop year by year in the price of tea, may appear to many the most serious matter we have to contend against. To a certain extent this is so, but although not very pleasant at the time, it has the redeeming feature of checking large extensions of tea clearings and of pressing home on us the absolute necessity of economic production, of maintaining the quality of our teas and persevering in pushing their consumption in new markets (hear, hear). When these two desirable things—a lessened annual increase of production and increased consumption—are brought about, we may hope to see the product in a better position in the market than it is today. To return to our own special interests in the Ceylon Tea Plantations Company, I may say your directors have no fear whatever for its future, unless, indeed, the tea consuming world gives up drinking the beverage, which is scarcely likely in our time. When this Company is able to earn 22 per cent on its ordinary share capital after paying its preference interest, in the worst year the Ceylon tea industry has experienced it appears reasonable to entertain the belief that we are likely to continue for many years to come to pay good dividends (applause.) I consider it is advisable to point this out, as there is an unreasonable apprehension at the present moment with regard to all tea Companies and the shares of good concerns are in times like these prejudicially affected in sympathy with less favourable situated ventures.

From the report you will observe the yield was equal to 495 lb. per acre from 8,067 acres, so that when our young tea is a little older we may reasonably look for an annual crop of not less than 500 lb per acre, which over such a large acreage is a good yield. The trees on our estate estates are reported as doing well and every year now, will see a steady increase in crop. The only place we have in bearing is Seringapathe, and this gave a profit of 7 per cent on its capital cost. When the whole of this estate is in full bearing we expect a return of at least 8 per cent, which, if obtained you will I think consider satisfactory on this portion of our reserve fund. Mawatte fibre factory is now completed and we hope to have satisfactory results from it and also the Hunupitiya desiccating and coconut oil mills during the current year. Our other reserve investments of £28,829 in securities are taken as usual at their cost values and the balance of our reserve is profitably employed in the agency business we have in connection with other tea Companies and proprietors. I do not know that I need say anything further but as usual shall be very pleased to answer any questions the shareholders may desire to ask and to give you any information that may be in our power to afford. I would now propose "That the report and statement of accounts, as submitted, be received and adopted, and that a final dividend of 8 per cent on the ordinary shares, making 15 per cent for the year, free of income tax, be declared payable on and after 30th inst." (Applause.)

Mr. G. A. TALBOT :—I have much pleasure in seconding the adoption of the report and the accounts. I have as most of you know, lately returned from visiting the estates in Ceylon, and I can fairly say they are as carefully worked as they have been heretofore, and are all in good order. Our Chairman has rightly pointed out what he has correctly termed the anxiety about the tea of the future, and I, as one of those responsible for the working of the estates, have naturally looked to this part of the question and considered the position as to our strength, and reserve, for withstanding what we may call a siege of bad prices and low exchange, and how we shall be able to withstand them if these difficulties increase. You have heard me speak before about plucking and manuring. Our plucking is being carefully done, and the bushes have not been exhausted more than has been absolutely necessary. We have, where the conditions have been favourable, planted grass and instituted cattle sheds, and renewed with sustaining manure the fields that required it most. So we have, if required, a reserve strength in our bushes to fall back upon. But I have been further into the subject of manuring. Heretofore we have not resorted to artificial manures as they are called, partly because there was no need to do so, and partly because no one was quite certain of the effect they had, and we wished to do nothing that would injure the strength of our bushes by the use of any forcing manures. Lately, however, a great deal has been done in finding out the effects and different manures in Ceylon by analysis of soils and by experiments; and must say here that I think the good feeling that there is in Ceylon which prompts the planters to help each other by information, speaks very much in their favour and assists them all round. As far as I am concerned, when in Ceylon I had every assistance, from those who

knew, in finding out the effects of different manures, and in coming to conclusions which will be useful hereafter, and I am glad to acknowledge all this considerate co-operation. The effect of these manures has now been found to increase the yield of the tea—and consequently the paying property of the tea—without increasing the cost, because when you increase the yield the cost per lb. on certain works goes down. Though these concentrated manures, as we may call them, have been used in one or two cases for eight or nine years they show no effect in the way of doing any harm to the bushes. So if the time should never come when the Ceylon Tea Plantations Company thinks its profits are not what they should be, we have also this reserve force to fall back upon: we can use these stimulating manures and increase our yield and output without injuring our bushes (hear, hear.) I may say that we ourselves have made arrangements to manure some of our fields with the stronger manures, partly because we wish to see what the result is, and so as to be quite certain in which direction to extend our manuring operations should the time arise when we find it necessary. I had the pleasure of addressing you last year, and I then spoke on what was then the burning question of the coast advances and the labour force in Ceylon. The burning part of that question has disappeared. Owing to the scarcity of rice in India the coolies have come over in great numbers to Ceylon, and I am quite within the mark in saying our estates are better supplied with labour than ever they have been before. Consequently this point about advances has been got over; the coolies have been so plentiful that there is no necessity for making these larger advances. In fact, the advances are being reduced (hear, hear.) And in that respect I would remind you that we have full confidence, in our staff. They are capable, and are using tact and energy in reducing these advances, and we may, in leaving the matter in their hands, be sure that this point, which appeared last year to be a rather dangerous one, will now be got over without any difficulty.

Mr. WELLDON:—Comparing this year's report with last year's I see that our first-class securities are some £8,000 less than last year and our coconut figures are about £8,000 more. The coconut profits are about the same. Is it within the power of the board to invest our money in anything outside first-class securities and the coconut plantations. What I mean is, would you consider it within your province to take shares in other Companies. That would be an important step, and one to which I should have a great objection to our taking (hear, hear.)

Mr. G. SETON:—It is a great satisfaction to us to hear what Mr. Talbot, who has technical experience, has told us about the manuring, because it is a question which has been very much *subjudice*. He has given, I consider, a very decisive opinion, which we can all appreciate. What he has said about this rather nasty question of coast advances, and so forth, is also very satisfactory. I would just like to point out that for the past year our advances seem actually to have increased. But I take it from what Mr. Talbot has said that it is merely a temporary advance and we shall probably see them diminish greatly. Could the Chairman say what the loss on rice has cost the Company and also whether at the present moment there is a loss on rice?

I understand there is no loss now that the famine is over. All the shareholders who are here are no doubt familiar with tea production; but coconuts are a sort of novel thing in connection with tea Companies. Can you give us in a few words, something to explain to us what the different products obtainable from the coconut are? I take it in the first place the fibre is of a certain value, than the nut itself—copra is shipped for some purpose or other—and thirdly the product known as desiccated coconut. You have already stated that you think these coconut plantations ought to give about 8 per cent on their cost. Is that a fair expectation in view of the possibility of a large increase in the production of coconuts. If a large number of Companies like yours introduce these coconuts will it much diminish the profits to be earned from them? As to putting your Reserve Fund into these coconut mills I rather gather from the shareholder who spoke before me that he questions the wisdom of this course.

Mr. WELLDON:—Oh, no.

Mr. SETON: I misunderstood you. I think the directors are wise in doing this as a sort of hedge against tea. I quite agree with the report that the whole state of this well managed Company can only give ground for the great satisfaction of all the shareholders. Mr. Rutherford has made a point of the exaggerated views, people are taking as to the end of all things (laughter); but, as he has said, looking to the value of the shares of Companies seem to suffer more relatively than the others (hear, hear.) The better a thing is, the more sensitive it is to any fear there may be as to the future. That applies both to Indian and Ceylon tea Companies.

The CHAIRMAN:—When we started this reserve fund, we hoped as nearly as possible to keep our securities at about one-half of the amount we were placing in the coconut business. If you take the absolute first-class securities and the balance which we have in working you find it practically comes to half and half—half in money and half in estates. It was necessary, of course, to put more to the coconut estates, because we bought a large area of land which was all jungle, and in order to bring that into cultivation it was necessary to dispose of some of our securities. What we estimate is that we don't intend to buy any more coconut lands. We have enough to do to develop the land we have now. We have 1,421 acres not in bearing, which means we have got to keep it probably eight years before we get anything out of it. But it takes only about £1 an acre. I estimate that the coconut estates when in bearing will not cost more than £27 an acre—£12,000 or £13,000 a year, which must of course come out of our reserve fund. The next question to answer is, have we any shares in other Companies? We do not hold a single share in any Company and we don't intend to (hear, hear.) With regard to coast advances, they have increased somewhat this year, but I think it will be found that in all Companies they have increased this year. In our last mail from the manager, however, he says he hopes to decrease the advances by about 20 per cent this year. As to rice, I was of course comparing last year with 1895 in my speech, and the difference on rice account is £3,000 for last year. Mr. Seton asks if 8 per cent is a safe return on coconuts. I think it is. Of course, I can't say what the price of coconuts will be in the next year and the year following, but if Sirangapathe estate

was in full bearing we should have earned 8 per cent last year. I think that shows it is a wise investment (hear, hear.) If we can earn enough from our coconut estates to pay our preference dividends, then the whole of the tea properties belong to the ordinary shareholders (hear, hear.)

Mr. SETON:—What about the coconut products?

The CHAIRMAN:—Well; we don't sell many nuts as nuts; we manufacture the nut chiefly into copra, made chiefly into oil, for candles, soap, etc. The fibre is got not merely from our own estates; we purchase from native holdings at a low rate.

The motion was adopted unanimously.

The CHAIRMAN proposed Mr. Henry Tod's reelection as a director.

Mr. DAVID REID seconded the proposition, which was carried unanimously, Mr. Tod briefly replying.

Mr. ADAMES proposed a vote of thanks to the Chairman and Directors. The demand for Ceylon tea was, he said, increasing all over the continent.

The proposition was seconded by Mr. G. T. WHITE, and carried unanimously, the proceedings closing with a vote of thanks to the Ceylon staff, proposed by Mr. DANGERFIELD in eulogistic terms.

EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

The eleventh ordinary general meeting of shareholders in this Company was held at Winchester House, Old Broad Street, London, on April 29th, Mr. C. J. Lindsay Nicholson presiding.

The SECRETARY (Mr. Douglas R. Smith) having read the notice convening the meeting.

The CHAIRMAN said:—In rising to propose formally that the reports and accounts be received and adopted—and which I shall ask you to take as read—I am almost tempted to ask you to extend the courtesy and take the remarks I am about to make as said, for really there is so little that I can add to the fulness of this report. Indeed, as far as the success of this Company has gone, I am glad to say it is a mere twice-told tale. Still, in narrating the events of the Jubilee year, a year so full of rejoicings on this side and so full of plague, pestilence, war and other troubles for Her Majesty's Eastern dependencies, I can only say it is a subject of sincere congratulation that your directors, in the face of falling prices, of climatic influences which have reduced the crop, and other disadvantages such as the rise in the price of rice, which is so important to this Company, are able on this occasion to declare an increased dividend of 7 per cent, to put a sum of £5,000 to reserve, and to carry, over the very handsome sum of something like £11,000. We think you will congratulate us on this. (Hear, hear.) At the same time I will not trouble you with a long dissertation upon it. It seems to me that we are rich in advisers and reporters. The able circulars of our neighbours in Mincing Lane and the excellent articles which appear in the *Investors' Magazine* and in the *Ceylon Observer*, must give you Ceylon people very full information of the rise and progress of tea. There is no doubt we have to combat increased production, but as I have said before, and as my colleagues who have visited Ceylon lately have said, you are served in Ceylon by an able, intelligent and assiduous body of men (hear, hear)—from Mr. Starey, our manager down to the youngest assistant; and although it is only such praise as this that can recompense them for their work I believe there

is no body of men more ready to practise economy and make this concern a complete success than our officers in Ceylon. The position of a planter or superintendent as to emolument is not brilliant but we find that most of our men are keen in desiring to see this old Company a success. I need not trouble you on the subject of exchange. Abler men than I have told you repeatedly of the difficulties which have arisen from the artificial rspec. I believe there is some Commission coming forward in the House of Commons to do something for it; but let us hope that whatever is done will be final, and not be of such a character as to be still subject to vicissitudes (hear, hear). While on the subject of this Company and its future—it is very difficult to prophesy unless you know, and dangerous—I was very much interested, and I dare say many of you were too, in listening to what the Chancellor of the Exchequer said in the course of his Budget speech, when he alluded to his peculiar virtue in consuming neither tobacco nor tea, having left him perplexed as to which of the two things should be relieved of taxation. He said he had carefully thought the matter over, and had determined to reduce the duty on tobacco. I cannot help thinking that it now seems probable that whoever is in the chair next year will be able to congratulate you, not only on the success of the Company, but on the fact that the cup that cheers, but that does not inebriate has been freed from taxation (hear, hear). We need not go through the accounts. But I might refer to the item showing that debentures for £7,500 have been paid off. As we come towards the end of these we should not desire to pay off such huge sums as we have done; but at the present moment we draw for the debentures and pay them off. I mention this incidentally. We have written off a large sum for depreciation—by no means a necessity, though it adds to our safety and security. If any shareholder has any question to put, I shall be very glad to answer him. I now formally move:—“That the report of the directors dated 13th April 1898 be received and adopted, and that a final dividend at the rate of 2½ per cent. on the capital paid up on the preferred shares and at the rate of 4½ per cent on the ordinary shares for the year ending 31st December 1897, be declared and made payable on the 3rd May 1898.”

Mr. R. A. CAMERON (managing director):—I have much pleasure in seconding the proposition. This is the tenth year since the Company was formed, and every year up to now it has been a progressive one as regards profits. I do not call this year's slight falling back a matter of anxiety at all. It has been due to causes entirely beyond our control. There is a considerable satisfaction, in speaking of this Company, that our profits are of such a varied character that we have suffered much less than we might otherwise have done. No doubt conditions like the present require us to be strict in economy and careful in manufacture; but as our chairman has said, the staff are fully alive to this, and you will join with me in recognition of the praise due to them for the way they have answered to the necessities of the situation (applause). There are several encouraging features in the figures. The continued increase in consumption of Ceylon tea outside the United Kingdom is very encouraging. The figures show that in 1897, 29,000,000 lb. of Ceylon tea went to parts of the world

other than this country, as compared with 23,500,000 lbs. in the previous year, the total of Indian and Ceylon having been 51,000,000 lb. as against 42,500,000 lb in the previous year. That all means substantial relief to the market here. We must lose no opportunity of improving the position. There are several new methods and ways undertaken in various quarters to promote this, such as direct shipments to Russia and over-side shipments to America. All this we have endeavoured to keep up and to support as much as we could; and the efforts have been profitable in nearly every case. Our agency business continues to give every satisfaction. We handled 14,500,000 lbs of tea this last year, the largest amount we have ever handled. (applause) As to the charges for buildings and machinery, you will notice in the account that a larger sum has been spent this year; but it was a necessity, for our early provision in this respect has not been anything like adequate for the enormous amount of tea now produced. So it is necessary now to very largely augment our equipment in this direction. We always write off the whole cost of these buildings in five years and of the machinery in three years, and I might point out that the £12,000 in the accounts represents no machinery of later date than six years, and in time that will disappear, though other expenditure may take its place. None of us can venture to make forecasts as to exchange. But taking the whole circumstances of our Company into account and the undeniably sound position we are in, and keeping in mind our policy of cautious distribution of dividends, there is no need for discouragement or apprehension on our part (applause).

The motion was carried unanimously.

The CHAIRMAN:—I formally move, "That Mr. Norman W. Grieve and Mr. David Reid be re-elected directors of the Company."

Mr. WAHAB seconded the proposition, and it was carried unanimously.

Mr. NORMAN W. GRIEVE:—I beg to thank you, gentlemen, on behalf of my colleague and myself. The present position of affairs in the industry is brief, and it really affords some encouragement. As some of you may be aware, the recent drop in prices of tea, and the bad times generally we have gone through in Ceylon, have had one very good and encouraging effect, and I think may have a very considerable influence on expenses in management there. The tea seed, which was recently at a very great premium, has now ceased to a very large extent to be in strong demand. That points out clearly that we shall not see an enormously increased acreage of tea in the near future—a very hopeful feature (hear, hear). It will have a considerable effect on the labour market. Owing to the abnormal rush to new land there has been an abnormal rush for the labour force, and prices have naturally gone up. I hope the stopper put on the extension of tea has had a good effect on our labour question. We may, I think, look for a considerable reduction in coast advances for coolies and for a more settled state of the labour market. I hope the coolies will be in a more comfortable condition, and that our able managers will be able to get from them even more work than in the past (hear, hear.)

It was proposed by Mr. Robertson, seconded by Mr. Lowe, and agreed, "That Messrs. Welton Jones and Company be re-elected auditors of the Company for the ensuing year at a remuneration of £50."

This closed the proceedings.

THE POONAGALLA VALLEY (N) LIMITED.

The second ordinary general meeting of the shareholders of the Poonagalla Valley (Ceylon) Company, Limited, was held at the offices of the Company, 16, Philpot Lane, E.C., on April 27.

The chair was occupied by Sir George A. Pilkington.

The Secretary read the notice convening the meeting.

The Chairman, in moving the adoption of the report and accounts, expressed regret that the results of the second year's working of the Company showed such a considerable falling-off in the receipts as compared with the first year. The reasons for this falling-off in the profits were the same as those applying to nearly all other similar enterprises, viz. high exchange and low prices, both of which subjects he had, he remarked, just alluded to at the meeting of the Highland Company. but in addition to these two troubles they had had to contend with almost total failure of the coffee crop. The report showed that they only obtained 153 bushels as against 1,651 last year—a very serious drop; these three causes accounted for a deficit of £1,432 as against last year. He was glad to say this year promises better as regards the coffee crop, and much of the young tea will soon be coming into bearing. The directors were giving their great attention to schemes for lessening the cost of working the estates and hope by means of a system of wire shoots and by concentrating the manufacture of tea in one factory at the bottom of the valley to save a great deal in the cost of transit, and to remove some grievances which have had a tendency to unsettle the labour force. The board had been much strengthened by the addition of Mr. Porter. He had recently visited and reported on the estates, and had made many valuable suggestions, which would, he (the chairman) hoped, tend to economise working, and to the attainment of higher prices at home. They had a very valuable property acquired at a very low rate per acre, and under more favourable outside circumstances might confidently look forward to better results in the future.

The resolution was seconded by Mr. G. G. Anderson, and carried unanimously.

The Chairman then proposed "That a dividend of 3 per cent (free of income tax) for the year be declared, payable forthwith."

The resolution was seconded by Mr. R. Porter and carried unanimously.

The re-election of Mr. G. G. Anderson, the retiring Director, was proposed by the Chairman, seconded by Mr. R. Porter, and unanimously adopted.

On the motion of Mr. Stocks, seconded by Mr. L. F. Davis, the auditors of the Company, Messrs. Cape and Dalgleish, were re-elected.

The proceedings closed with a unanimous vote of thanks to the Chairman, proposed by Mr. D. Andrew and seconded by Mr. P. Cowan,

—H. and C. Mail.

THE HIGHLAND TEA COMPANY OF CEYLON, LIMITED.

The second annual ordinary meeting of the Highland Tea Company of Ceylon, Limited, was held on Wednesday, April 27, at the offices of the Company, 16, Philpot Lane, E.C., Sir George A. Pilkington in the chair.

Notice convening the meeting having been read the report and accounts were taken as read. The Report is as follows:—

Directors:—Sir Geo. A. Pilkington, Bellevue, Southport (Chairman); Geo. G. Anderson, 16, Philpot Lane, E.C.; Robt. C. Bowie, Aldourie Estate, Agrapatana, Ceylon; R. Porter, Arnhall, Brechin, N.B.

Agents in Ceylon:—Lewis Brown & Co., Colombo. Bankers:—The Commercial Bank of Scotland, Limited, 62, Lombard Street, E.O.

Secretaries and Office:—Lyal, Anderson & Co., 16, Philpot Lane, E.C.

Report of the Board of Directors to be presented to the Shareholders at their Second Annual Ordinary Meeting to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Wednesday, 27th April.

The Directors have now the pleasure to submit to the Shareholders the Report and Accounts of the Company for the year ending 31st December, 1897.

The nett profits for the year amount to £2,371 12s 11d, which with £204 2s 5d brought forward from previous year, give a total to be dealt with of .. £2,575 15 0

Interim Dividend of 3½ per cent (free of Income Tax) paid in September, 1897, amounted to .. £1,120 0 0

It is now proposed to pay a Final Dividend of 3¼ per cent (also free of Income Tax), making 7 per cent for the year, absorbing .. 1,120 0 0

And to write off the Balance of Preliminary Expenses .. 260 0 0

2,50 0 0

Leaving a balance to carry forward of £75 15 4

Owing to the unfortunate position of Exchange and the state of the Tea market, the nett profits for the year fall short of those earned for 1896, but the Directors are glad that, notwithstanding that fact, they are able to recommend a distribution to the Shareholders at the same rate as last year.

The total crops secured for the year from Chrystler's Farm and Glenorchy Estates amounted to 230,205 lb., being about 385 lb. per bearing acre, showing the satisfactory increases of 25,185 lb. in the total and 28 lb. in the average secured over previous year.

The average price realized for the whole crop was 8-6993 per lb., and the average rate of Exchange 1/3 21/32nds. per rupee, against 9-1071 per lb. and 1/2 51/64th per rupee for 1896.

The Company's Visiting Agent, Mr. R. C. Grant, continues to send home very favourable reports on both properties, and under his advice, the Directors have sanctioned the clearing of 22½ acres jungle on Chrystler's Farm and 10 acres on Glenorchy, both of which clearings will be planted up in Tea during current season. In accordance with Article No. 76 of the Articles of Association, the Directors have since last meeting elected Mr. Robert Porter to a seat at the Board, and his valuable and long experience as a Planter and Visiting Agent will prove of great service to the Company. As provided in the Articles of Association, Mr. G. G. Anderson retires from the Board and, being eligible, offers himself for re-election. The Shareholders will also be called upon to elect Auditors for the ensuing year, and Messrs. Cape & Dalgleish, C.A., again offer themselves for this post.

The Chairman, in moving the adoption of the report, reminded the shareholders that last year at the annual meeting he expressed the opinion that the result of the year's working was not an indication of the full earning powers of the property. He thought this statement was borne out by the fact that in spite of a year of very exceptional depression they were able to show a well-earned seven per cent dividend. The chief

causes of depression were the high rate of exchange and the low prices realised for tea in the London market, both causes beyond the control of the management. The high rate of exchange and consequent fictitious value of the rupee was caused by the closing of the Indian Mints, and it seemed to him that the interests of the tea industry, representing in India and Ceylon £40,000,000 of invested capital, were being sacrificed between the influence of Lancashire exporters and the exigencies of the Indian Government. So serious had the question become that strong agitation was being made in the island to bring the subject under the notice of the home authorities, and they would have to rest in the hope that before long something would be done to place the currency on an honest basis. With regard to the second cause, viz., low prices, he was afraid planters themselves were much to blame for advising too rapid extension of tea cultivation, and sending to the home market an immense quantity of inferior tea. These two causes accounted for a very considerable falling off in the receipts as compared with last year. They would observe that the directors had invited Mr. R. Porter to take a seat on the board. This was owing to the fact that one of their colleagues had gone to the island for an indefinite period, and the board felt it essential to have amongst them a practical planter to whom they could from time to time refer on matters requiring the opinion of an expert. In Mr. Porter the board felt it had secured an ideal director; not only was he one of the most experienced and successful planters on his own behalf, but his large experience as a visiting agent had given him exceptional facilities for acquiring knowledge of the tea industry.

Mr. R. Porter seconded the motion "That the report and accounts as presented to the shareholders be received and adopted." Carried unanimously.

The following resolutions were also put to the meeting and carried unanimously.

Proposed by the Chairman, seconded by Mr. Geo. G. Anderson:—"That a final dividend of 3½ per cent (free of income-tax), making in all 7 per cent for the year, be declared, payable forthwith."

Proposed by Sir Geo. A. Pilkington, seconded by Mr. R. Porter:—"That Mr. Geo. G. Anderson be re-elected a director of the Company."

Proposed by Sir Geo. A. Pilkington, seconded by Mr. Geo. G. Anderson:—"That the ordinary meeting of the Company be held at such time in the month of April or May and at such place as the directors may from time to time determine."

Proposed by Mr. J. W. Stocks, seconded by Mr. C. J. Scott:—"That Messrs. Cape and Dalgleish, C.A., be re-elected auditors for the ensuing year."

Proposed by Sir George A. Pilkington, seconded by Mr. J. W. Stocks:—"That a vote of thanks be given to the Ceylon and London staffs for their efficient working of the Company's property and business."

Proposed by Mr. D. Andrew, seconded by Mr. H. Fraser:—"That a vote of thanks be and is hereby given to the Chairman and directors of the Company."

The proceedings then terminated,
—H. and C. Mail.

NUWARA ELIYA

COTTAGERS' HORTICULTURAL AND
POULTRY SHOW.

Complete List of Awards :

NUWARA ELIYA, May 13.

The Show opened today in brilliant weather. There was a large attendance. The following are the awards :

Class 1 for the best cropped and cultivated vegetable garden in Nuwara Eliya Board limits, 1st Mrs. Burrows ; 2nd, not awarded.

For best flower garden, first Mrs. Colls ; second Mrs. Masfield ; extra prize Mrs. W. O. Garth for best market garden.

Class 2, Geraniums, first, Mrs. Aitken ; second not awarded.

Begonias, first E. J. Thwaites ; second Miss L. Cave.

Fuchsias, second Mrs. Aitken.

Extras : Orchids first J. Hill ; second, E. J. Kellow.

Class 3 no exhibit.

Class 4 ferns best collection single adiantum T. H. Moorhouse ; best single specimen of any other foliage plant, F. G. Saunder.

VEGETABLES.

Class 5, best general collection of foreign vegetables, first Mrs. W. O. Garth ; second Mrs. T. R. Walker.

Potatoes best collection, first Mrs. W. O. Garth.

Best dish potatoes first, A. J. Kellow ; second Mrs. Garth.

Pears, first prize, not awarded, second K. A. Saibo & Co.

Beans, French, first, S. M. Burrows.

Broad do, first, Mrs. Garth.

Cabbages, first, Mrs. T. R. Walker.

Cauliflowers, Mrs. Garth.

Lettuce Cos Mrs. T. R. Walker.

Lettuce cabbages, Mrs. T. R. Walker.

Class 6, Beetroot, best dish, three roots, F. C. Loos.

Celery, K. A. Saibo and Co.

Vegetable marrow, Mrs. W. O. Garth.

Tomatoes, D. C. Jayawardene.

Cucumber, R. Jackson.

Carrots, Mrs. Garth.

Turnips, Mrs. Garth.

Artichokes, Mrs. Garth.

Leeks, Mrs. Garth.

Parsnips, K. A. Saibo ; Brussels Sprouts, no award.

Kohl kohl, K. A. Saibo ;

Potherbs, first, no award ; second Mrs. Garth.

Salad, vegetables first, no award ; second Mrs. Garth, extra prize Mrs. Garth.

FRUIT.

Best general collection, first, Mrs. T. R. Walker ; second, Mrs. Kellow ; third no award.

Peaches, first no award, second A. J. Kellow.

Pears, first, Mrs. T. R. Walker ; second, no award.

Strawberry first, John Cotton ; second, no award.

Tree tomatoes, first, Mrs. T. R. Walker ; second E. J. Thwaites.

Pine apple, Korale of Uda Palate, second Yatipalata.

Oranges, Mrs. Kellow.

Rhubarb, C. M. Cornalis De Silva ; second D. E. Jayawardena.

Passion fruit, F. G. Saunder.
Mountain pawpaw, Mrs. T. R. Walker,
Any other papaw, Mrs. T. R. Walker.
Citron, E. J. Thwaites.
Best dish of any other fruit, not named above,
Mrs. T. R. Walker.

CUT FLOWERS.

Yellow roses, first, A. J. Kellow.
Pink roses, first, A. J. Kellow.
Carnations, first, Mrs. McLeod ; second, Master Garth.
Phlox Drummondi, first, Mrs. Loos ; second Mrs. Bois.
Verbenas, first, E. J. Thwaites ; second, Mrs. Saunder.
Daisies, best bunch, Mrs. Saunder.
Sweet peas, Mrs. Bois.
Best arranged table bouquet, first, Miss Edley ; second Mrs. Saunder.
Best arranged hand bouquet, first Mrs. Loos ; second, Miss E. Kellow.
Best three button holes, first no award ; second, Mrs. Loos.
Best group wild flowers, first Miss E. Kellow.
Best three blooms of any flowers, first, E. J. Thwaites.

NATIVE VEGETABLES, FRUITS, &C.

Best collection of native vegetables, first, Deyatalawa Korala ; second, Siathu, teacher.
Best collection of capsicums and chillies, first, Udaganpaha Korale.
Best collection of plantains, first, Gamba Korala ; second Yatipalata Korale.
Best dish chocho, first, Udaganpaha Korala.
Best three coconuts, Banda, Kotmale.
Best three punkins, Apphani Arachchi.
Best dish brinjals, Udaganpaha Korala.
Best collection, oranges, Kotmale, R.M.
Best bottle cow ghee, Deyatalawa Korala.
Best bunch arecanuts, Pallegampaha Korala.
Special for coconuts, Jayawardene Mudaliyar.

PRESERVED FRUITS, VEGETABLES, BREAD, &C.
Best collection of Ceylon jams, etc., first, Mrs. Moorhouse.

Best collection of Ceylon pickles and chutneys, first, Mrs. T. R. Walker ; second, Mrs. Moorhouse.

Best 2lb. loaf of home-made bread, David Appu.

Best loaf baker's bread Paul Soris and Company.

Best loaf brown bread, Mohideen Saibo.

DAIRY PRODUCE.

Best fresh butter, David Appu ; second Mrs. Scott.

Best sample milk, Abram Saibo.

Best piece country cured bacon, Mr. C. Liesching.

Best basket fowls, eggs, Mrs. Moorhouse.

Best basket turkeys' eggs, Mrs. Moorhouse.

Best honey comb, Aluwattegoda.

Special for guineafowl eggs, Mrs. Moorhouse.

Special for cream, Mrs. Scott.

POULTRY.

Best Plymouth rocks, Mr. A A Bowie.

Silver medal best pen in show, Mr. A A Bowie.

Silver medal, pair turkeys, Mrs. McLeod.

Silver medal, best pair ducks, J H W Mayow.

Bronze medal, extra prize for ducks, Mrs. W Hardy.

Bronze medal peacocks, Banda Kotmale.

Silver medal, porcupine, Mr. North.

Silver medal table decorations, first Miss Cave ; second Miss V Saunders ; third Miss Jowitt.

DOGS.

Collies, Mr. Ross, gold and silver medal, Mrs. Bowie, (Silver medal), Mr. W. Hardy, (Silver medal).

Airedale, Mr. A E Wright.

Bronze medal, Irish setters, Mr. A A Bowie.

Two silver medals, Spaniel Mr. H V Masefield.

Bronze medal retriever Mrs. Edley.

EXCHANGE AND THE TEA TRADE.

INTERESTING CORRESPONDENCE.

The following is the reply of Mr. W. Martin Leake to the letter by Lord Farrer in the *Economist* which we have already published:

Sir,—As no one has come forward to answer the question propounded by Lord Farrer in his letter on "Exchange and the Tea Trade," published in your issue of the 9th instant. I venture to ask a little of your space for the purpose.

The question it will be remembered, was this:—"Which of the two is right—Mr. Skrine, who says that Ceylon tea is ruined by the high exchange value of the rupee, or you, who tell us of the increased export of tea from Ceylon, in spirit of superior quality in Japan tea?"

If for the word "ruined" (a word used only by Lord Farrer and not appearing in his quotation from Mr. Skrine) the words "has received a serious check, and is threatened with ruin," be substituted, I answer unhesitatingly that both are right, and that the question reveals, on the part of Lord Farrer, a curious ignorance of the conditions under which tea is produced.

Tea bushes are permanent plants that do not yield crop till they are three or four years old. The increase of exports of tea from Ceylon in 1897, on which Lord Farrer relies as a proof of the flourishing position of the industry today, was due, speaking broadly, to the increase of area in bearing in that year.

This increased area was planted in the years 1892, 1893, or at least 1894, most of it before the Indian Mints were closed—all of it before the closing of the Mints had become effective. Is it possible that his lordship can have expected that the tea bushes thus planted would be so affected by that closing as to stop bearing?

It has been said that an ounce of fact is worth a ton of theory. For the first time in the history of our industry tea seeds have within the last few months been reported as unsalable. Three or four years hence the result of the check given to planting by the 1s 4d rupee will show itself in the exports, but not before.

The question that I have attempted to answer was avowedly framed to exemplify the "nonsense so constantly talked by merchants about the effect of exchange on trade." It has, I fear, missed its aim, but it may yet be useful in connection with the rupee controversy as a warning how far even the most eminent theorists may be led from the paths of good sense by a lack of practical knowledge.—Your faithfully, Wm. MARTIN LEAKE, Secretary. Ceylon Association in London, 61 and 62, Gracechurch Street, E.C., April 18th, 1898.

TROPICAL ACCLIMATIZATION.

At the Royal Geographical Society, on Wednesday, a paper was read by Dr. Sambon on "Acclimatization of the white man in tropical lands." Sanitation had wrought wonderful changes, he said, in the healthiness of all tropical countries. They had been considered unfit for the permanent settlement of white men on account of their climate, or, to be more correct, on account

of their heat, because the word climate had been used as synonymous with heat. Heat was supposed to induce deterioration and diseases such as anæmia, liver abscess, and sunstroke. But anæmia was not due to heat, being in the tropics a symptom common to several parasitic diseases. Liver abscess was likewise of parasitic origin and sunstroke was a microbial disease, however paradoxical the statement might appear, on account of the mistaken etiology perpetuated by an erroneous nomenclature. As for deterioration, it was far more alarming in the overcrowded cities of the old world than in tropical colonies. The geographical distribution of tropical diseases was of the greatest importance in the study of acclimatization. Diseases being due to living organisms that had their peculiar dissemination like all other forms of life, this distribution was likewise determined by a variety of circumstances, among which meteorological conditions were certainly important, but association and competition more so. Under proper management European children did very well in tropical colonies, in the most unhealthy of which infant mortality was lower than in some districts of Europe. The belief, again, that white men could not labour in the tropics was disproved by facts. That man was capable of adaptation to a new climate was shown by the fact that he had constantly moved from one region to another. If attempts at colonization in the past had often been unsuccessful and always cost immense sacrifices in lives and money, it was because they had been made incomplete ignorance of the conditions essential to success. Acclimatization was a mere question of hygiene, and what was needed above all was a complete knowledge of tropical diseases. A discussion followed.—*Times Weekly Edition*, April 29.

TRADE OF INDIA FOR 1897-8.

We have just received from the Government of India a copy of the "Accounts relating to the Trade and Navigation of British India for the 12 months 1st April 1897 to 31st March 1898 compared with the corresponding period of the years 1895-6 and 1896-7." These accounts in full detail are issued for the whole Indian Empire in less than six weeks after the year closes; while in the case of little Ceylon we are still without the Report and Accounts of the Principal Collector of Customs for the calendar year 1897, although 4½ months have elapsed! Surely, there is much room for improvement here. India shows a falling-off in both Imports and Exports last year, a fact which ought to be considered in connection with the restricted currency. Of tea, the total export is given:—

1897-8	=	151,451,817 lb.
1896-7	=	148,903,461 "
1895-6	=	137,710,205 "

Of tea seed, the shipments were:—5,371 cwt.; 4,212 and 3,238 for the three years respectively. Coffee exports do not compare badly:—

1897-8	..	225,000 cwt.
1896-7	..	210,737 "
1895-6	..	290,902 "

Of rice Ceylon got:—

1897-8	=	4,583,022 cwt.
1896-7	=	3,897,888 "
1895-6	=	4,656,100 "

which indicates no falling-off, but a considerable increase last year over its predecessor.

Of cardamoms and cinchona the exports compare :—

	Cardamoms lb.	Cinchona lb.
1897-8 ..	108,961	3,056,769
1896-7 ..	65,969	321,478
1895-6 ..	140,772	939,938

So that there has been quite a revival of cinchona bark harvesting. Cardamoms are, of course, too much in demand in the Presidency towns to be shipped freely. Chillies, ginger and pepper are the spices chiefly exported thus :—

	Chillies,	Ginger,	Pepper.
1897-8 ..	8,154,144	8,273,489	9,688,930 lb.
1896-7 ..	8,126,173	10,708,223	13,604,520 "
1895-6 ..	8,290,346	10,802,988	9,852,112 "

Of coconut and castor oils the export is considerable :—

	Coconut Oil.	Castor Oil.
1897-8 ..	1,046,225	1,953,509 gallons.
1896-7 ..	1,137,538	1,997,475 "
1895-6 ..	2,205,727	2,016,461 "

The export of cotton had greatly fallen ; that of jute had increased ; manures were steady ; so was the export of mica (tale) at 11,608 cwt. —For caoutchouc and coir (unmanufactured) we quote :—

	Caoutchouc.	Coir.
1897-8 ..	5,563	60,994 cwt.
1896-7 ..	6,213	39,200 "
1895-6 ..	7,154	43,289 "

Besides this, coir manufactured or partly, made up 277,194 cwt. last year, and cordage and rope (excluding jute) 37,504 cwt. Be it noted that the export of caoutchouc is steadily decreasing.

FISH CULTURE AND HORTICULTURE : AN INTERESTING VISITOR.

Amongst the passengers from Brisbane to Europe by the ss. "Duke of Devonshire," is Mr. D. O'Connor, who has been interested very largely in fish acclimatization in Queensland. He has with him four *Ceratodus Fosterii*. This fish is one of three dipnoi, the two other species being *Lepidosiren paradoxii* of South America, now nearly extinct, and *Protopterus annectans*. The *Ceratodus* is confined to two rivers in Queensland, the Mary and Burnett, not being known to exist anywhere else in the world. With a view to prevent its extinction Mr. O'Connor recently transferred specimens to six different localities in Queensland, widely apart on the recommendation of the Royal Society. Encouraged by the success attending his efforts in this direction he resolved to attempt the transportation of a few specimens to England. A month ago, on the 15th April, he took on board the "Duke of Devonshire," four specimens which are now alive. They extend from 2 to 3 ft. in length and are in as good condition as when they left Queensland. They are kept in two tanks, the water of which is frequently changed, and fed twice a day. He considers that the secret of the fish being kept properly is to have some one, who understands about their care, being in constant personal superintendence. At Otago in the South and Wellington in the North they have, according to Mr. O'Connor, a revenue of over £500 a year from licenses nearly the whole of which is derived from trout licenses. The trout in Queensland have grown to a weight of about 30 lb. There are about six different kinds, but the trout he recommends for a climate like Ceylon is the rainbow trout of California

as it stands the heat better than any other. He thought the *gourame*, which was a very excellent fish, might be acclimatized here without any difficulty. The *gourame* is a fish always kept in captivity and the fish is taken to market alive and when it is not sold, it is taken back to the pond. The species is abundant in Batavia.

With regard to horticulture in which Mr. O'Connor is also very much interested, he alluded to the cultivation of the mango and the manner in which the fruit might be served, and said a very delicious preserve, not jam, might be made of the fruit by taking it before it is ripe, peeling it, cutting it into slices, dishing it, piling sugar on it according to taste, and then baking it. Another very easy and pleasant mode of eating mangoes was also used in Queensland, namely peeling them, cutting all the flesh off the stone, placing the fruit in a dish and mixing with cream and sugar. The passion fruit was eaten in the same way.

"SOURCES OF COMMERCIAL INDIA- RUBBER";

CANTOR LECTURES SOCIETY OF ARTS ;

By DR. MORRIS, C.M.G. ;

LECTURE I. DELIVERED APRIL 18TH :

(Summary specially contributed by the lecturer.)

Since the days when Le Condamine first described the rubber tree of Brazil and Don José, King of Portugal, in 1755 sent several pairs of his royal boots to Para in order that they might be covered with the water-proof "gum-elastic" the use of India-rubber has enormously increased. Besides the demand in almost every department of arts and manufactures, the rapid development of cycling and of the use of rubber tyres for carriage wheels has added to the increased consumption of this interesting article. The quantity of raw Caoutchouc imported into the United Kingdom in 1830 was only 23 tons. Even in the year of the accession of our Queen it was only about 200 tons. Last year it had increased to 20,000 tons—exactly a hundred fold.

The present value of the imports are about five millions sterling. The total trade is probably not less than ten millions sterling. More than one third of the imports is now received from British possessions. In 1888 only about one-fifth was so received. It is estimated that the world's consumption of rubber is 60,000 tons, of the value of 14 millions sterling. This stupendous quantity of raw material is laboriously extracted from the milky juice of trees and shrubs belonging to three natural orders, viz., the Spurges (*Euphorbiaceae*), the Nettles (*Urticaceae*) and the Dogbanes (*Apocynaceae*). These plants are distributed over nearly every part of the tropical zone—none are found in the temperate zones—the most important being found in the vast basin of the Amazon, an area almost as large as that of the Continent of Europe ; others are found on the East and West Coasts of Africa, in Assam and the Malay Archipelago.

Hitherto the preparation of India-rubber has depended upon the crude hereditary art of a semi-savage people, the rubber-hunters, who explore the depths of tropical forests and obtain the rubber milk at the sacrifice of millions of trees, which owing to the recklessness with which they have been treated are yearly decreasing.

The result is that many localities where rubber was once abundantly obtained have almost ceased to produce it. New sources or supply have, it is true, been found in West Africa, especially in Lagos, the Congo State and Portuguese South-West Africa. But here also the work of destruction is rapidly going on. The collectors have to go further and farther into the interior and the cost of transit is thereby greatly increased. An account was given by the lecturer of an important discovery whereby the rubber could be extracted from the milk in a perfectly pure state. This is a mechanical contrivance on the principle of a cream separator. This was likely to prove of great value in the preparation of Central American and some West African rubbers where the milk flows in an appreciable quantity and is capable of being brought in by the collectors. It would be indispensable on regular plantations of rubber-trees. By such means the process of preparing the rubber could be kept under scientific control and all injurious substances such as proteids and all dirt and chip-excluded. The value of the rubber so prepared has been shown to be increased fully 25 per cent.

The rubber-trees of Brazil were then exhaustively described together with the distribution of the various species yielding the Para rubber of commerce. The exports from Para in 1897 including rubber received from Bolivia, Peru and Venezuela amounted to 22,650 tons. Of this amount 51 per cent was shipped to the United States and 38 per cent to the United Kingdom, leaving only about 11 per cent or 2,509 tons for all other countries.

The price of Para rubber which regulated the prices of all other sorts has been steadily increasing since 1894, when it was 2s 11d per pound; in 1895 it rose to 3s 2d; in 1896 to 3s 4d; in 1897 to 3s 6½d; while the average price for the first three months of 1898 was 3s 9½d. At the last sales on the 15th inst., it was 3s 11d per pound. It was, however, pointed out that these prices were below what they were in 1882 and 1883, when fine Para fetched 4s 4d per pound.

There is a consensus of opinion that in nearly all localities in Central America, the trees of *Castilloa elastica* are being gradually exterminated. Hence the supply of rubber from Mexico, Guatemala, Nicaragua and the U.S. of Colombia is steadily diminishing. The interesting tree yielding Ceara rubber (*Manihot Glaziovii*) readily propagates itself and its area has not apparently sensibly diminished of late years. The people, are, however, being more and more attracted into the rubber districts of the Amazon valley and the amount of Ceara rubber exported is comparatively small.

Mangeibeira rubber on the other hand seems to be increasing. The tree (*Hancornia speciosa*) is found in the States of Pernambuco, Bahia, Rio de Janeiro, and extends westward to Matto-Grosso. The rubber is cured by means of alum. It is of a pinkish colour and the price is generally only one half of that of fine Para. Passing on to the rubber-producing areas of the Old World it was stated that the rapid development of African rubber was one of the most remarkable incidents of recent years. As regards the world's commerce, Africa now occupies a second place as a source of India-rubber. The value of the imports of African rubber into the United Kingdom during 1896 amounted to over a million sterling. Of this Foreign Possessions

supplied rubber to the value of £206,972 and British Possessions £844,840. Up to within a recent period all the rubber produced in Africa was obtained from climbing plants belonging to the genus *Landolphia*, with sweet-scented flowers and edible pulpy fruits. In 1894 a new rubber tree (*Kickxia*) was found at Lagos from which in 1895 rubber to the value of nearly £300,000 was exported.

More recently still another new rubber-plant (*Carpodinus*) has been discovered in Africa. This is of a semi-herbaceous character with underground stems which are rasped in water and yield rubber of excellent quality. The rubbers of Assam, Burma, Penang, and Singapore were then dealt with. Borneo rubber although known since 1798 has only come into commerce within the last fifty years. It is yielded by climbing plants, closely related to the *Landolphias* of Tropical Africa and is generally of excellent quality.

New Guinea rubber is in part yielded by a species of *Ficus*. The natives are said to allow the sap to run over their arms and body, and when hardened they remove it and roll it up into balls, the size of cricket balls. The prospect of obtaining some of the future supplies of rubber from cultivated trees was favourably regarded. In selecting sites, preference should be given to localities in which the trees were already found. Para rubber-trees introduced to the East at the expense of the Government of India had done remarkably well in Ceylon, Tenasserim, and the Straits Settlements. In Ceylon such trees were estimated to yield 100 to 120 lb of rubber per acre after the tenth year. This would give a probable return of 20 per cent. on the capital invested. In the Straits Settlements the trees were apparently found to yield at an earlier age and the estimated returns per acre were placed as high as 30 per cent. It was added that where rubber trees were cultivated under suitable conditions, they would probably yield a larger quantity of milk than wild trees; also that the rubber from the greater care and attention it would receive would be more uniform in quality and therefore obtain a higher price.

SUGAR IN MAURITIUS:

GOVERNOR SIR CHAS. BRUCE INTRODUCING
OFFICIAL "CROP ADVANCES" FOR THE
SUGAR PLANTERS OF MAURITIUS.

A novel departure from all past official rules and precedents is about to take place in Mauritius, and it will be extremely interesting to watch how the scheme (almost certain to be adopted) will work out. We take the following from the *Planters and Commercial Gazette*, Port-Louis, April 29:—

An excellent Ordinance.—With our Saturday's paper we issued a supplement in which we gave in full the Draft of an Ordinance:—"To provide for the making of temporary advances from Public Funds to the owners of sugar estates for the purpose of enabling them to carry on the cultivation of their estates and for the securing and recovery of the advances so made"—which said Draft was laid on the Council table on Friday last. As most people know, the proposed ordinance is to allow the Government to place three millions of rupees at the disposal of planters to enable them to secure the magnificent sugar crop that is now in perspective;

We have heard many persons express the belief that the clause which gives the Government priority of claim, in cases where it lends money to enable crops to be secured, will cause embarrassment both to proprietors and mortgage creditors. According to them the Government is too exacting in its guarantees. They allege that mortgage creditors will refuse to accord a first privilege on the estate itself, as they will wish to have their own interests properly secured. At first sight, there appears to be a show of reason for these objections, but on reflection it disappears. In the first place, if the Government does not effectually protect itself against any chance of loss, the Secretary of State will not consent to have the 3 millions of Rupees placed at the disposal of planters. Secondly, we do not see how the privilege of which we speak, could in any way act prejudicially towards proprietors or mortgage creditors. One article of the ordinance says:—"An advance shall not be made of a greater amount than two thirds of the total value of the crop on the security of which the advance is made as estimated by the Board"; and in another part of the ordinance it is stated:—"An advance shall not be made unless the Board is satisfied that sufficient money for carrying on the cultivation of the estate is not otherwise procurable on reasonable terms." It is therefore an exceptional law, made under exceptional circumstances, and only transitory. The State exacts that the whole of the growing crop and a first privilege on the estate shall be given as a guarantee. This privilege over the rights of the mortgagee in cases where he consents to abandon his priority, would be only nominal—until such time as the Government had repaid itself by the sale of crops. If there remained a balance due to the State after each crop was sold, it would be so small as to be not worth speaking of; such being the case the mortgages could not have the slightest objection to the Government ranking before him for a sum so insignificantly small. But we repeat, it is nearly certain that at the end of the 1898-99 crop no important balance will be due to the State. This clause in the law was necessary, otherwise the Ordinance would never have seen light—for the State would not be disposed to allow itself to rank as an ordinary creditor. For these reasons this Ordinance, which has been prepared with the help of financiers and men of experience, is excellent, and the sooner it is put into force the better it will be for us all. We hope that the members of the Legislative Council will accept the ordinance in its entirety—except, perhaps, one or two modifications of little importance. It is only a provisional one, and has been conceived with the idea of saving the planters, and giving them the means of securing a crop which promises to be an unprecedentedly large one. Sir Charles Bruce has taken the initiative in combating a crisis which was becoming daily more and more acute. By doing so he has proved himself to be an able administrator and a true friend to Mauritians. The whole community is deeply impressed by and grateful for His Excellency's action.

Later on we read in the Council proceedings of an amendment to an important clause:—

"No loan under this Ordinance shall be effected unless such objection is withdrawn by the creditor who has made it or unless such objection be declared by the Court on motion made by the owner, to be null because the person making it is not or does not represent indebted privileged or mortgage creditor or creditors holding a title due and demandable against the *Owner*." The amendment was put to the vote and carried by 21 to 5 those voting against being Sir V. Naz, Mr. Sauzier, Dr. Rohan, Messrs. E. Antelme and de Ceriolis. The other articles of the Ordinance were adopted and the Ordinance was read a third time and passed.

But not only mortgage creditors, but ordinary creditors for store debts, rice, &c., strongly object unless their accounts against the estates are at once to be paid. Then again who are

to get the Rs.3,000,000—is it to be "first come first served," or is a proportionate division to be made over all the estates? There is to be a Loan Board to decide on all such questions and on the advances to be made, these being limited to 3/4ths the estimated value of the crops in each case, the interest charged to be 8 per cent. One enthusiastic advocate of the loan measure estimates that the Government (by turning bankers) will make a clear profit of Rs200,000; but suppose a "hurricane" devastates the sugar plantations after the advances are made and before the canes are harvested? What a risky business!

SNIFE IN CEYLON:

THE DIFFERENCE BETWEEN THE "PINTAILED AND "PAINTED" SNIFE.

The following letter appears in the columns of our evening contemporary:—

Sir,—With reference to the letter from "Ornithology" in your issue of the 12th inst., headed "Do Snipe breed in Ceylon," the following may be interesting:—In 1871, when stationed at Kurunegala, Mr. Johnny Jobsz, a proctor, sent me a couple of young snipe as a curiosity. They were found above the Kurunegala tank. I fed the birds on worms, but they lived only two days. This is the only case of young snipe that I have known in Ceylon. Painted snipe breed in Ceylon, I have often been told, but I never found young birds. —Yours, &c.,
EVAN M. BYRDE.

The Residency, Anuradhapura, May 16.

This has followed one or two statements of individual casual experiences; but it is strange that neither editor nor correspondent has thought of referring to the great authority on the Ornithology of Ceylon: Legge, p. 818, says of Gallinago Stenura (the Pintailed Snipe) our common species "some few birds occasionally remain in the island throughout the year; but these are evidently unfit for migration, owing to wounds, or, in some cases, they may be first year birds, which, as in the case of other Waders, remain stationary the first year. There can be no other cause to make snipe remain in such a tropical latitude as Ceylon." The penultimate sentence is a little puzzling as it would lead one to suppose that the young birds were bred in Ceylon, when the drift of the writer's argument is against such an hypothesis. But what are we to think of the editorial note appended to Mr. Byrde's letter by our "Sporting contemporary?"

[NOTE BY ED.—The above is most interesting. We were shown a young painted snipe caught near Polgahawella in 1855.]

We cannot but recommend a course of "Legge" to our contemporary. For, at present, he is evidently unaware that the "painted snipe" is a "permanent resident" in the Ceylon lowlands. We quote for his benefit and that of readers who may be interested in the subject:—Legge: On *Blynychoa Copensis* (the Painted Snipe) says:—"Distribution,—the painted snipe is a *permanent resident* in the lowlands of Ceylon; but on the West and South Coasts there is an increase of its numbers at the commencement of the cool season;" page 804 "Nidification. The painted snipe either has two broods in the year, or else it breeds indiscriminately at all seasons. It may be said, however, as a rule, that more nests are found, young captured, and eggs taken from dead birds between November and May than at the opposite season of th"

year. I have seen an egg taken from a specimen at Galle in March, young captured at Wackwella in September, and known that nestlings have been seen in May at Udagamna. In the Colombo district eggs have been procured in April, and young found by Mr. MacVicar in February. Mr. Holdsworth mentions the fact of a wounded bird laying an egg in a basket in which it was confined on the 31st December; but at this time of the year I have killed birds in the North of Ceylon which showed no signs of breeding. Layard states that the season of nidification is from May till July; but this observation is perhaps based upon a single occurrence. I myself shot a female that had evidently risen from the nest, in July, in the Hambantota district." * * * "The number of eggs laid in Ceylon seems usually to be four."

MAURITIUS;

Port Louis, April 28, 1898.

VANILLA.—The market is in the same situation. We have to record the sale of a few small lot good quality at R37 to 38 per kilo. We maintain our last valuation as regards the outturn of the crop which will not exceed 5,500 kilos. We quote nominally:—

1st quality..	..	R37 to R38 per kilo.
2nd do.	R34 to R35 do.
Good to middling	..	R32 to R33 do.
Vauillons	R27 to R28 do.

ALOE FIBRES.—The market is Firm. We have to quote the sale of 175 bales 1st quality at R195 to R200 per ton and 65 bales 2nd quality at R185 to R190 per ton of 1,000 kilos.

COFFEE.—Both qualities are well supplied and worth R50 to R55 for good quality and R18 to R25 for mixed Triage per 50 kilos.—*Planters and Commercial Gazette*, April 29.

IPECACUANHA.

The source of supply is the rather limited area of the plateau of Matto Grosso, west of the Paraguay river, near the western border of Brazil, and in the extreme N.W.W. of Rio de Janeiro. Although the ipecacuanha plant is said to grow over "a very wide extent of territory" in Brazil, the collection is confined to the small patch. The demand for iudiarubber is drawing off the labour from ipecacuanha-gathering. The cost of the drug to the merchant in Curitiba is by no means trivial, for he must spend at least 3s per lb. before he gets the supply into his yard and ready for despatch to the coast. A return to cheap prices—say, 6s per lb. in Mining Lane—seems very remote.—*Chemist and Druggist*, April 30.

THE OLDEST FIELD OF TEA CEYLON: 30 YEARS OLD AND AS VIGOROUS AS EVER.

On each occasion that we have compiled a new edition of our "Handbook and Directory" within the tea era, we have applied to the Manager of Loolecondra estate for a few words of report on the state of the first field of tea planted by Mr. James Taylor in 1867, and Mr. G. F. Deane has on several occasions now very courteously responded as he does on the present occasion:—"Replying to your letter of 17th the oldest field of tea on Loolecondra is still looking remarkably well and continues to give yields varying from 400 to 500 lb. made tea per acre per annum. Last month (April) I got 65 lb. made tea per acre from it, but that is one of my best months; the wind when the S-W. monsoon is on, usually

checks it severely. It last year received a heavier pruning and cutting down than it ever had before and looks all the better for it. The ground is a network of roots and the stems of the bushes are very thick. This tea is now some 30 years old and is very wind-swept in S-W. monsoon and has I believe never been manured. The China tea planted along roadsides in 1866, shews no sign of decay; and 84 acres of tea planted in 1874-5 is looking well and gave 413 lb. made tea per acre last season." All this is very interesting and also encouraging as to the lasting character of our tea-fields in Ceylon.

CHINA TEAS AND ADULTERATION.

Report of the Sub-Committee of the Shanghai Chamber of Commerce on measures that are necessary to prevent the adulteration of Tea.

Shanghai, 6th April, 1898.

SIR,—In reply to your letter of 12th ult., enclosing a despatch from the Thatai and a decree from H. E. Lin K'un-yi, Superintendent of Trade for the Nanyang ports, re measures to be adopted to prevent the adulteration of Tea, we have now the pleasure to report upon the same in accordance with your request.

As there appears to be a good deal of uncertainty in the minds of the writers of the decree as to the requirements of the new law passed by the United States Government for the exclusion of spurious tea, we think, perhaps, the best way to put things in a clear light before them would be to give the results of this past season's working at the various ports of the United States as far as we can gather from our own experience, and from what has come to our knowledge.

TEENKAI AND MOYUNE TEAS.—We have not heard of a single package of tea from these districts having been rejected by the Customs Inspectors in the United States, and from this it may be inferred that the present mode of preparation satisfies the requirements of the Act. Complaints are occasionally made of colouring, etc., but the manufacturers in these districts have always shown a very commendable honesty in keeping their teas pure and free from any admixture of willow or other leaf. Care, however, will have to be taken in the coming season to prepare teas with less colouring matter, as, judged by the standard selected for this season's guidance, a good many of last year's low grades, or lines, would not pass the Inspector. Buyers who remember the teas of twenty-five to thirty years ago see a great falling off in the beauty of make, etc., but the carelessness in this respect is chiefly the consequence of the reduced prices obtainable in Shanghai. A few chops retain a high reputation for quality and are eagerly sought after. If all Green Teas were as pure and as good as those produced in the Teenkai and Moyune districts no law for rejection would be necessary, but we might add, by way of a word of advice, that Teenkai teas would keep better if more highly fired.

FYCHOWS.—These teas are inferior to Moyunes and Teenkai teas, and this is owing in a great measure to want of care in preparation, and to the use of wood instead of charcoal for firing, which imparts a smoky, undesirable flavour to the tea. The early picked teas are of fair quality and were all admitted into the United States, but the second and third picks are generally coarse, dark liquoring, poor teas, and some of these have been rejected by the Inspector at New York and Chicago. The quality of second and

third packs will have to improve very much to be of any use for the United States' markets next season. We have not detected any adulteration in the leaf used, and the poor quality appears to be entirely due to the want of care in preparation. A proclamation prohibiting the use of anything except charcoal in firing these teas would go a long way towards improving them and making the best of them equal to Teenkai teas. At present some of the first picked leaf is mixed with Teenkai, leaf, and the smoky flavour reduces the value of the chops so mixed.

WENCHOWS.—The first pickings of these teas are generally pure, but they are thin and would never be equal to Moyune or Teenkai teas even if the greatest care was bestowed on their preparation. Second and third packs are poor and often contain a large proportion of damaged leaf which has changed colour, hence the sour flavour so much complained of in the United States. Only the best of these are suitable for America.

LOCAL PACKED TEAS.—These are manufactured in Shanghai, and are generally made from leaf brought up from Wenchow in a half fired state. In favourable seasons, when the leaf is in good condition, these teas are similar to those packed at Wenchow, but, as a rule, they are poor in quality, though made from genuine tea leaf.

PINGSUEYS.—It is to the short-sighted policy of men engaged in this trade that all the trouble in respect to these teas in the United States is attributable, and if it had not been for their disgraceful practices no exclusion law would have been required. When the demand increased for low priced tea, the Chinese in the Pingsuey districts, with a few honourable exceptions, met this demand by adulterating their teas. At first it was confined to additional colouring matter, but gradually willow leaf, honey-suckle and other leaves, also dust (not tea sweepings) mixed with congee and rolled into small pellets were added and coloured to represent the true tea leaf, until Pingsuey became Tea only in name. It is unprofitable to try and fix the blame of this deplorable state of affairs on any one class of people, but if the Pingsuey men had only been as pious in their attitude as their neighbours in Moyune and Teenkai and had kept their teas pure and unadulterated, China Green Tea would not have been legislated against in America. We now wish to direct your attention to the remedial measures adopted during the past year. The Bill in the United States to exclude the spurious tea was passed, and the standard of lowest quality to be admitted was sent to Shanghai in the Spring of 1898 before Teamen had begun to make the new crop, and so fair warning was given to all that no tea below the standard should be brought to market. Those who make good tea found a ready sale for their produce at very remunerative prices, but several who disregarded the warning made tea so near to the quality but inferior to the general requirements of the standard, that buyers had doubts about buying them and a large quantity is still left in native tea owners' hands, most of which is not good enough to be passed by the Inspector; although we believe it contains no admixture of willow leaf or other spurious matter. Much of the tea, however, is "faced" with a colouring matter which produces a scum or grease found floating on the surface when the tea is infused in the American way. There are also other black substances which find their way into the tea. These are what the Inspection Act strikes at to a great extent. This year the standard has again

been raised, and none except really pure tea will be admitted into the United States.

Teamen have had notice of this for some little time. A sample of the new standard was sent to Mr. P. G. von Mollendorf, Commissioner of Customs at Ningpo, and we enclose a proclamation issued by him to the Teamen. It is estimated that about 10,000 piculs of Pingsuey tea have been rejected by the Customs Inspectors in the United States this past twelve months, most of which was shipped by foreigners in the full belief that it was equal in quality to the standard, but nearly all was more or less mixed with perished leaf.

We have not heard of any one becoming sick from drinking China tea, and we think this is an exaggeration.

The foreign buyers like some colouring matter to be used in the preparation of tea to make more attractive to the eye is proved by the custom prevailing in Japan, where the leaf is brought to the market and brought in its natural state, and the colour is added by foreigners afterwards.

China Green Tea has not been increasing in favour in the United States of late years, and we attribute this in a great measure to the competition of Japan where the only tax is an Export Duty of \$1 per picul.

The poor quality of Pingsuey tea may have had something to do with its not being so much in favour as it was, but we doubt if in its present form Green Tea will ever increase much in consumption.

The Central Asian markets have increased to an appreciable extent, but buyers for these outlets confine their attention to the description known as Hyson, and they require the teas to be quite pure and free from smoky or other objectionable flavour. —We beg to remain, sir, yours faithfully,—J. W. Harding, Joseph Welch and E. Davis.

E. F. Alford, Esq., Chairman, Shanghai General Chamber of Commerce.

MINOR PRODUCTS.

London, April 30.

Oil, Cinnamon.—Privately leaf-oil is scarce, and best brands are held for 2½d per oz. There is plenty of common oil to be had, as our market table shows.

Oil, Lemongrass.—A quiet market, at 4½d to 5s per oz on the spot.

CINCHONA.

At the monthly cinchona auctions in London on Tuesday the offerings were again fairly extensive, the twelve catalogues comprising 2,230 bales, divided as follows:—

	2,230	1,763
East Indian cinchona	1,570 of which 1,211 were sold.	
Ceylon cinchona	303	263
Java cinchona	151	151
South American cinchona	146	83
African cinchona	55	55
	2,230	1,763

There was an improved tone, owing, no doubt, to the large purchases on American account.

The following figures represent the approximate quantities of bark purchased by the principal buyers:—

	Lbs.
Agents for the American and Italian factories	143,143
Agents for the Mannheim and Amsterdam factories	82,896
Agents for the Brunswick factories	70,865
Messrs. Howards & Sons	39,791
Agents for the Imperial Quinine factory	19,864
Agents for the Frankfort and Stuttgart factories	195
Druggists, &c	30,143

Total quantity sold .. 386,897
Bought in or withdrawn .. 102,970

Total quantity of bark offered 489,867

The following prices were paid:—Ceylon Saccirubra, natural stem-chips and shavings, ordinary to fair, 1½d to 2½d; renewed ditto, 2½d; renewed quill, 2½d, officinalis, renewed chips, 3d; Lædgeriana root, 5½d; and good stem-chips, 5½d per lb.

Annatto seed.—One broker sold fine bright at 4½d per lb.

Coca-leaves.—Some Ceylon leaves, which contain no cocaine, were offered without reserve, and sold at 1½d per lb.

Croton Seeds.—Dearer. Medium to bold sound seed sold at prices ranging from 7s to 8s per cwt.

Kola.—Poor and dark West India sold at 1½d per lb.
—*Chemist and Druggist.*

PLANTING NOTES.

THE CENTRAL TRAVANCORE ASSOCIATION has had a full meeting with several Ceylon names among those present. Some useful business as to roads, coast shipments, registration of carriers and telegraph arrangements, was transacted.

PUSHING INDIAN TEAS IN NEW MARKETS.—It is satisfactory to see the Indian Tea Association doing its best once more to rouse tea estate proprietors to a sense of their duty in regard to the New Markets Fund. Hitherto all India has contributed less than half the amount assessed from little Ceylon; just because the latter is a Customs assessment and the former collection is voluntary. The Travancore districts have been amongst the most liberal contributors. Now it is proposed to levy an assessment on every lb. of tea sold in Calcutta and in this way to raise perhaps no less than £390,000 or three times the present contribution—a half-pie a lb. could secure this. Now that steamers leave direct from Calcutta to America, more interest is likely to be taken in India, in "tea in America."

THE FIBRE TRADE.—A further reason why attention should be given to "fibres" at this juncture is brought before us in the letter of Mr. Arthur Silburn, "Fibre Dresser" to the *Natal Mercury*, April 26th.—We quote as follows:—

I beg to offer the following faint idea of the quantity of Manila hemp exported from the Philippine Islands during the three weeks ending January 24, 1898, as taken from the *Public Ledger*, London, of January 29, 1898:—

	Bales.
Shipped to the United Kingdom ..	12,000
Shipped to the United States ..	18,000
Shipped to other places ...	6,000
Loading for United Kingdom ..	28,000
Loading for United States ...	30,000

The ruling price for the above was £16 12s 3d f.o.b., and the freight to London 5s 6d per ton, and to Liverpool 5s per ton. For the last six years I have endeavoured to place this important industry on a commercial footing, but here in Natal gold and coal reign supreme. The prices for any and all classes of fibre are bound to go up, as Manila is the chief competitor in the hemp market all over the world, but the fibre sent by me from the mills at Umgeui fetched a higher price in the Liverpool open market than even this favourite of the rope-maker, viz., £23 15s per ton. It is only the want of moderate capital that compels me to keep idle the complete fibre-dressing machinery that is now lying at the above-mentioned works. I started sending plants to the Lower Umzinkulu farmers three years ago, but with the exception of Mr. Albers it has met with little response, but I am still in hopes of being able to turn out down there a few hundred tons of dry fibre, with the aid of my patent machinery, before long, to disprove the assertion that Natal is a Colony of samples.
Mr. Silburn ought to try Ceylon.

THE GUM-FIELDS of Northern New Zealand absent many features that are unique. They have one of the most remarkable populations these colonies can present. When a Northern New Zealander finds the world against him instead of retiring to the Domain, as in Sydney, he retires to the gum-fields. It is the last resource of the broken remittance man. There are to be found clergymen, lawyers, doctors, members of the British nobility who find it convenient to temporarily suppress their titles and their identity, the flotsam and jetsam of human wreckage. To many of these the gum-fields have proved salvation. To those incapable of moral reclamation they have been the last stage on the road to ruin. Side by side with this heterogeneous mass of all nationalities and all classes is a compact body of Austrians, working assiduously and systematically, sober, thrifty, and industrious. They have come out from Austria direct to these fields, though they knew little or no English and little of English ways. The gum lies spread over a good part of the North Island north of Auckland. It has been left in the ground by the noble kauri pine trees, which have disappeared in ages past, and the diggers procure it by probing the ground with a gum spear or by digging in likely spots.—*Sydney Mail*, April 16.

TEA IN CHINA AND THE REVIVAL OF THE EUROPEAN TRADE.—The experiments being tried at Foochow and Hankow of making tea by machinery will be watched—says the *Shanghai Herald* of April 25—with great interest, as the export to Europe is apparently doomed to gradual extinction unless something is done to revive this important trade. It may be doubted whether any efforts to compete with India and Ceylon will prove successful so long as the Chinese Government persists in the suicidal policy of strangling the trade by excessive duties. The taxation of tea amounts on an average to 30 per cent of the value, and until this crushing weight is lightened no improvements in the method of manufacture will enable it to compete with the untaxed product of India. On the other hand, the closing of the Indian mints has forced the rupee up to an artificial value and given China an immense advantage in exchange; so that the present is an exceptionally favourable time for pushing on every endeavour to regain some of the lost ground. The cost of tea on the Indian garden has been greatly reduced of late years. Small estates have been amalgamated, thus reducing the number of factories and consequently the amount of European supervision necessary. The introduction of machinery has reduced the hands required in the factory, and skilled labour is practically eliminated. In the huge estates in the plains, the enormous quantity of leaf available and the facility and cheapness with which it can be handled by machinery, have made it possible to place the tea on the Calcutta market for four annas a pound or even less. At the present rate of exchange between Hongkong and Calcutta, this is equivalent to \$0.18. Before the closing of the Indian mints four annas were equal to less than \$0.12, and the difference represents the advantage which the closing of the mints has brought to the Chinese exporter. Supposing China, by the use of machinery, can make tea for the Indian cost in silver, \$0.12, a pound would be equal to \$16 a picul. But since tea can be made in this country for a still lower price even by hand, it would seem certain that only those gardens in India where the cost of production is very low would have any chance of competing with Chinese machine-made tea. High-class Chinese tea would easily compete in price with similar grades from India and Ceylon. There are, however, three things absolutely necessary to secure success. The factories must be established where there is an abundant supply of leaf close at hand; experienced European tea-makers accustomed to the use of machinery must be engaged, and taxation must be lowered. Given these three essentials, the export of Chinese tea to Europe will increase rapidly.

PRODUCE AND PLANTING.

JAPANESE TEA.—It is mentioned in the report of the Yokohama Chamber of Commerce that the quality of the crop of tea—a great staple of the Japanese export trade—was decidedly inferior last year to that of 1896 and it is stated that Indian and Ceylon teas are now rapidly gaining an advantage in the United States and Canada, the chief markets for Japan teas. Meanwhile the restrictive measure adopted in America, requiring the quality of the tea imported to be up to a certain standard, has made more careful selection necessary. On the whole, the year is said to have proved fairly remunerative to the Japanese tea grower, though the attempts to introduce Japan tea into Russia have not yet met with much success.

THE BUDGET AND THE TEA DUTY.—Amongst tea producers opinions differ as to the advantages likely to accrue from the farther reduction or abolition of the duty on tea. The majority of consumers, on the other hand, would like to have seen the duty on a popular article of food reduced or abolished. The Chancellor of the Exchequer thought proper to please the consumers of tobacco on the score that it was many years since there had been a reduction of the duty, and that other articles of produce have previously received benefits. A total remission of the duty on tea is a public service which we shall expect from some future Chancellor. Meantime the arguments used against the reduction or abolition of the duty on tea apply in the case of tobacco. It is argued by some that the market will be glutted with cheap and worthless tobacco, while others maintain that the reduction of duty will mean cheaper and better tobacco, the benefit of which will be specially felt by the working classes. In analysing the "breakfast table" part of the revenue Sir Michael pleasantly extolled tea and coffee, both of which had "done well." But cocoa in proportion as a friend of the Exchequer had done better relatively than either. There was a laugh when Sir Michael, a Bristol M.P., began to advertise the merits of cocoa as a beverage, the feeling being expressed that a Chancellor of the exchequer looks kindly on produce in proportion to its yield to the revenue. Since his Budget speech no fewer than three of the rival factors of cocoa have put forth pictures associating the Chancellor of the Exchequer with their particular brand.—*H. & C. Mail.*

CEYLON TEA COMPANY MEETINGS.

CEYLON PROPRIETARY TEA ESTATES COMPANY, LIMITED.

(FROM OUR OWN REPORTER.)

The first annual meeting of shareholders in this Company, which was formed in January 1897, was held on Monday, May 2nd at 20 Eastcheap, London, the Chairman, Mr. G. A. Talbot, presiding. There was a good attendance, which included Messrs. H. K. Rutherford and R. A. Cameron (directors).

The Secretary (Sir Wm. Johnston, Bart.) read the notice convening the meeting.

The CHAIRMAN:—We are very sorry, gentlemen, that Mr. F. H. Wiggins, one of your directors, cannot be here today. He has been very unwell, and is still in the hospital, but we are glad to hear that he is now making satisfactory progress towards recovery (hear, hear). As you have all received the report and accounts, I presume it is your pleasure that they be taken as read. As this is the first annual report that the directors have presented to you, it is as well briefly to consider the conditions under which the Company has worked during the year.

As compared with the previous year, on the basis of which our estimates were framed, the general selling average price of tea has been $\frac{1}{2}$ d lower, and the rupee on an average was worth 1d more—1d rise in exchange means $\frac{1}{4}$ a lb. increase in cost of the production of tea—and the loss on rice supplied to the coolies, owing to its increased cost through the Indian famine, is another factor increasing the cost. These items make roughly 1d a lb diminished profits through general and unpreventable causes, and 1d a lb. on our crop of 868,710 lb represents over 4 per cent on our ordinary share capital. Whether these conditions will last or not it is not for me to say, but I may remark that the price of rice is falling. As to the present inflated value of the rupee, this is doing so great and so increasing an injury to Indian trade that it is only reasonable to hope that the Government will take some action to relieve the strain on producers, as an act of expediency if not of justice (hear, hear.) If, however, unfavourable conditions of market and exchange continue, we are in a position to meet them, for four out of our five estates are at a comparatively high elevation, and should therefore produce good tea. They are all in good order, I am able to report, for I visited each of them this year, and provision is made in the estimates for improving the cultivation by manuring. On Radella estate during last year, a factory of the best type was put up, and the machinery on Forres estate was reorganised with new motive power. It is therefore only reasonable to hope that the quality of the tea on these estates—and they are both first-class properties—will be maintained if not improved under the more favourable conditions. I shall be very pleased to answer any questions the shareholders may wish to ask, and to give you any information in my power. I have now to propose: "That the reports and statement of accounts as submitted be received and adopted, and that a final dividend of three per cent on the ordinary shares, making five per cent for the year, free of Income Tax, be declared payable on and after 5th May."

Mr. H. K. RUTHERFORD:—I have great pleasure in seconding the resolution.

Mr. E. TYE:—I notice there are 100 acres to be added to the area of tea this year. What area is suitable for tea out of the 800 acres that we seem to have to spare on the estates?

The CHAIRMAN:—I should say about 150 acres.

Mr. TYE:—In addition to the 100?

The CHAIRMAN:—Yes.

Mr. TOTTENHAM:—Speaking from memory I think the capital issued when the Company was formed was £102,000: £104,500 seems now to be the figure. Where did the other £2,000 odd come from? You seem to have issued more.

Mr. RUTHERFORD:—We acquired an adjacent property. It has a very small acreage. These are the vendors' shares.

The motion was carried unanimously.

Mr. G. T. WHITE proposed that the directors' remuneration be fixed at £300, commencing with the year 1897.

Mr. TOTTENHAM seconded.

Mr. LINDSAY NICHOLSON:—It seems to me that at the time when we are doing the worst we are of ten having to work the hardest, and I was going to suggest that, seeing what a good Company this is and what a future it has before it, our directors should be entitled to draw £100 a year each, which would make £400 instead of £300 I am satisfied they will not draw this

unless we are doing well. But it is always easier to arrange fees at the commencement. We are so confident that we shall succeed that we may as well show how that if we do we should like our directors to draw more than a quarter of £300 a year each.

Mr. G. T. WHITE:—I accept the suggestion.

Mr. TOTTENHAM:—Speaking from my experience of other Companies I should say that £300 was about the proper figure.

Mr. WORTHINGTON:—I gladly second the amended proposition.

The proposition as altered was then agreed to.

The CHAIRMAN:—We are very much obliged for the nice way you have put it. I may say we shall not draw the £400, but we are obliged all the same (Hear, hear.)

The election of Messrs. Harper Bros., as auditors for 1898, on the motion of Mr. J. Leake, seconded by Mr. E. Tye, brought the meeting to a close.

THE RANGALLA TEA COMPANY OF CEYLON, LIMITED.

REPORT OF THE DIRECTORS.

For the year ending 31st December, 1897, to be submitted at the annual general meeting of shareholders to be held at the offices of the Company, on Monday, 9th May, 1898, at 2 p.m. The directors have the pleasure to submit the balance sheet and profit and loss account to 31st December, 1897, duly audited. The net profit, including the balance of £1,184 14s 7d brought forward from last account amounts to £2,526 0 1. The final dividend for the year 1896 was paid on 26th April, 1897, amounting to £1,100. An interim dividend for the year 1897 was paid on 13th September, amounting to £660. Total £1,760 0 1. Leaving a sum of £766 0 1.

Which it is proposed to apply as follows:—

In payment of a Final Dividend of 3 per cent for 1897—Free of Income Tax—making 6 per cent for the year	£660 0 0
Balance to be carried forward to 1898 account	106 0 1
	<hr/>
	Total. £766 0 1

The result of the year's working does not compare favourably with the preceding season, but this is attributable to the higher level of exchange and to the somewhat lower range of prices that has recently prevailed in the London tea market.

The yield of tea for 1897 has fallen short of the estimate, owing in a great measure to unpropitious weather at the end of last year, but the quantity of cardamoms was greater than was anticipated.

The sales of tea show a net average price per lb. of 6.70 pence, being equal to, say, 43 cents per lb.

Exchange for the Company's drafts during the year has averaged 1s 3 35-641. as against an average exchange for 1896 of 1s 2 17-32d; this fact alone adversely affecting the profit to a considerable extent.

The acreage of the estate is as follows:—

	Acres.
Tea in full bearing	591½
„ partial bearing	63
„ not in bearing	61½
Cardamoms	56
Grass and Fuel Timber	25
Forest and Waste Land	444
	<hr/>
	Total. 1,241

The yield of tea per acre has been 360 lb. as against 380 lb. in 1896.

During the year an additional expenditure of £544 1s has been incurred on capital account, but a sum of £300 for depreciation of machinery, and £55 11s 7d realised by the sale of tea plants, &c., have been written off Capital Expenditure. The prospects for the current year are satisfactory, the estimated yield being 240,000 lb. of made tea and 5,000 lb. dry cardamoms.

SCOTTISH CEYLON TEA COMPANY, LIMITED.

REPORT OF THE BOARD OF DIRECTORS,

To be presented to the shareholders at their ninth annual ordinary meeting to be held at the offices of the Company on Thursday, 12th May, 1898, at 12 noon.

The Directors have now the pleasure to submit to the shareholders the accounts and balance-sheet for the year ending 31st December 1897.

The net profits for the year amount to £4,429 5s 8d, to which has to be added £1,252 7s 3d brought forward from last accounts, giving a total sum to be dealt with of	£ s d
An interim dividend on the ordinary shares of 5 per cent (free of income tax) paid in September 1897, absorbed	2,050 0 0
Dividends on the 7 per cent preference shares have also been paid, amounting to	630 0 0
It is now proposed to pay a final dividend on the ordinary shares of 5 per cent (free of income tax), making 10 per cent for the year	2,050 0 0
	<hr/>
	4,730 0 0

Leaving a balance to carry forward to next account of £951 12 11

The Directors much regret that, owing to the high level of exchange during the past season and the depressed state of our tea market, the results for 1897 compare so unfavourably with those of previous years.

The average rate of exchange was 1s 3 13-32d per rupee, against 1s 2 15-16d per rupee for 1896, and the average price realized for the tea sold in the London market was 7 956d per lb., against 8 860d per lb. during last season, and to these two factors is mainly due the regrettable shrinkage in profits.

Owing to unfavourable weather at the close of the year, the total crop secured from the Company's properties fell somewhat short of expectations, the out-turn being 708,533 lb. or 4,467 lb. under estimate, against 720,200 lb. secured for 1896, the average yield being 415 lb. per bearing acre.

In addition to the above, 206,464 lb. of tea were manufactured for others, making a total output from the Company's factories of 914,997 lb. of made tea.

The Company's total acreage remains unaltered at 1,963 acres, including:—

Tea over 5 years old	1,627 acres
„ rising 4 and 5 years	80 „
„ under 2 years	13 „

Total in tea .. 1,720 „

The Ceylon Manager, Mr. Kerr, reports all the estates to be in good heart and likely to give satisfactory returns for the current season. The Directors would take this opportunity of again expressing their satisfaction with the working of the Company's staff, both in Ceylon and London.

“PADDY AND WEEVILS.”—We call attention to the letter of “Agricola” on this subject given on another page. The writer—a gentleman of special experience in native agriculture—draws a sad picture of the ravages already effected by the “poochie”; but gives no hint as to the kind of remedy to be applied, and yet the Sinhalese must know of some remedy from their past experience? We have referred to Dr. Watt's exhaustive work on the Products of India; but the enemies he deals with are those of the growing crop.

THE ANALYSIS OF MANURE.

We have received the following from Mr. A. Philip, Secretary of the Ceylon Planters' Association:—

Minutes of proceedings of a meeting of the Joint Committee of the Planters' Association of Ceylon and the Ceylon Chamber of Commerce, appointed to confer and to co-operate with reference to the subject of the Analysis of Manure, held at the Ceylon Chamber of Commerce Rooms, Colombo on Friday, the 29th April at 3 o'clock in the afternoon. Present:— Messrs. W. H. Figg, (Chairman, Ceylon Chamber of Commerce) in the Chair. A. Philip, (Secretary Planters' Association of Ceylon), F. G. A. Lane, James Ryan, F. Macindoe, (Messrs. Carson & Co.), Joseph Fraser, L. Muller, (Messrs. Freudenberg & Co.), A. Baur, M. Bremer, (Messrs. George Stuart & Co.), Hon. J. N. Campbell, A. A. Prideaux (Colombia Commercial Co., Limited).

Mr. Philip was asked to act as Secretary; The notice calling the meeting was read; Discussed the question generally; Resolved "that an Ordinance is desirable."

Considered and discussed clause by clause the draft of an Ordinance for regulating the sale of manures or fertilisers of the soil in conjunction with a copy of the English act 1893, to amend the law with respect to the sale of Agricultural Fertilisers etc., the following draft was the result:—

A DRAFT OF A PROPOSED ORDINANCE FOR REGULATING THE SALE OF MANURES OR FERTILISERS OF THE SOIL.

Whereas it is expedient to provide against the adulteration of manures or fertilisers of the soil. It is hereby enacted by the Governor of Ceylon, by and with the advice and consent of the Legislative Council thereof as follows:—

Warranty on Sale of Fertiliser.

(1) Every person who sells for use as a fertiliser of the soil any article manufactured in Ceylon or imported from abroad, shall give to the purchaser an invoice stating the name of the article and whether it is an artificially compounded article or not, and what is at least the percentage of the nitrogen, soluble and insoluble in water phosphates, and potash, if any, contained in the article, and this invoice shall have effect as a warranty by the seller of the statements contained therein.

(Note)? whether the word "Manufactured" should come before or after the word "article.")

(2) For the purposes of this section an article shall be deemed to be manufactured if it has been subjected to any artificial process.

(3) This section shall not apply to a sale where the whole amount sold at the same time weighs less than half a ton.

Penalty for Breach of Duty by Dealer.

(1) If any person who sell any article for use as a fertiliser of the soil or commits any of the offences, namely—

(a) Fails without reasonable excuse to give, on or before, or as soon as possible after the delivery of the article, the invoice required by this ordinance; or

(b) Causes or permits any invoice or description of the articles sold by him to be false in any material particulars to the prejudice of the purchaser.

He shall without prejudice to any civil liability be liable, on summary conviction, for first offence to a fine not exceeding R100 and for any subsequent offence to a fine not exceeding R500.

(2) In any proceeding for an offence under this section it shall be no defence to allege that the buyer, having bought only for analysis, was not prejudiced by the sale.

Power to appoint Analyst.

(3) The Government shall appoint one or more Government Agricultural Analysts for the land, who shall, while holding the office of Government Agricultural Analyst, not engage in any trade, manufac-

ture or business connected with the sale or importation of articles used for fertilising the soil. Should more than one Agricultural Analyst be appointed, one of them shall be appointed chief Agricultural Analyst.

A person alleged to have committed an offence under this section in respect of an article sold by him, shall be entitled to the same rights and remedies, civil or criminal, against the person from whom he bought the article as are available to the person who bought the article from him, and any damages recovered by him may, if the circumstances justify it, include the amount of any fine and costs paid by him on conviction under this section, and the costs of and incidental to his defence on such conviction.

Power for Purchaser to have Fertiliser Analysed.

(1) Every buyer of any article used for fertilising the soil shall, on payment to a Government Agricultural Analyst of the fee sanctioned by the Governor, be entitled within ten days after delivery of the article to the buyer, or receipt of the invoice by the buyer, whichever is later, to have the article analysed by the analyst, and to receive from him a certificate of the result of his analysis.

(2) Where the buyer of an article desires to have the article analysed in pursuance of this section, he shall, in accordance with regulations hereto appended, take three samples of the article, and shall in accordance with the said regulations, cause each sample to be marked, sealed, and fastened up and shall deliver or send by post one sample with the invoice or a copy thereof to a Government Agricultural Analyst, and shall give another sample to the seller and shall retain the third sample for future comparison. Provided that a Government Agricultural Analyst, or some person authorised by him in that behalf with the approval of the Governor shall on request either by the buyer or the seller, and on payment of a fee sanctioned by the Governor take the samples on behalf of the buyer.

(3) The certificate of the Government Agricultural Analyst shall be in such form and contain such particulars as are directed, in the schedule hereto annexed and every Government Agricultural Analyst shall carefully enter in a register to be kept for that purpose, the result of any analysis made by him in pursuance of this Ordinance.

(4) If the seller or the buyer objects to the certificate of the Assistant Analyst, one of the samples selected in like manner, may, at the request of the seller, or, as the case may be, the buyer, be submitted with the invoice or a copy, thereof to the chief analyst, and the seller, or as the case may be, the buyer shall on payment of a fee sanctioned by the Government be entitled to have the sample analysed by the chief analyst, and to receive from him a certificate of the result of his analysis.

(5) At the hearing of any civil or criminal proceeding with respect to any article analysed in pursuance of this section, the production of a certificate of a Government Agricultural Analyst shall be sufficient evidence of the facts therein stated, unless the defendant or the person charged required that the analyst be called as a witness.

(6) The cost of and incidental to the obtaining of any analysis in pursuance of this section shall be borne by the seller or the buyer in accordance with the results of the analysis, and shall be recoverable as a simple contract debt.

Penalty for Tampering.

5. If any person knowingly and fraudulently (a) tampers with any parcel or fertiliser so as to procure that any sample of it taken in pursuance of this ordinance does not correctly represent the contents of the parcel; or (b) tampers with any sample taken under this Ordinance he shall be liable on conviction to a fine not exceeding R500, or for imprisonment for a term not exceeding six months.

Application.

6. This ordinance shall apply to wholesale as well as retail sale.

COMMENCEMENT OF ORDINANCE.

7. This ordinance shall come into operation on the 1st day of January, 1898.

SHORT TITLE.

8. This Ordinance may be cited as the Fertilisers' Ordinance No.—of 1898. Resolved:—"That the question of appeals be referred to Council for consideration.

Resolved further:—"That the draft Ordinance as above indicated be submitted for the consideration of the Planters' Association of Ceylon, and the Ceylon Chamber of Commerce."

The Joint-Committee then adjourned.

THE CONTINUED DROUGHT: "RUBBING IT IN."

Writes a correspondent—needless to say a tea planter and not in a wet district:—

"For the last few months planters have not had their sorrows to seek. To recapitulate them would be to catalogue everything that tends to harass and depress the tea industry, and all that is wanted now to round the circle, is perhaps Plague and War. And yet there is very little in the *Observer's* columns to indicate to the outside world what a death-and-life struggle there is going on, over a large zone of planted tea. Most men have their teeth set firm, and don't incline to say much, and the continued dry weather—which is so very trying in many of the districts closing up flush, and drying up streams—seems as if it were sent to emphasise misfortune and 'to rub it in.'

"Estimates are hopelessly behind, and when the planter has so much to contend with—everything against him—it is a little rough to be further handicapped by an abnormal season, such as we are having. Of course what can't be helped has just to be endured, but it is the continued serving us with this unsatisfactory fare, that makes one long for a change.

"The drought is certainly a severe 'extra' to put up with—and except that the lessened output of tea has kept prices steady, and saved that fall of $\frac{1}{2}$ d which was to bring down many a goodly hope—and this can certainly be credited to the effect of the parching season, except that it has been a sad worry. Figures come in of the tea harvested; and the words 'Decrease as compared with last year' are growing hateful. So big is the array of numerals which stand behind it. A year ago, when one thinks of it, Ceylon was preparing to celebrate the Diamond Jubilee and there was a spring in the air, and a joyousness in life; but now a good deal has suffered eclipse: merry-making has given place to cross-carrying; troubles are roosting thick, and a planter's ordinary misfortunes are not only with us, but are markedly emphasized, and energetically 'rubbed in.' There is a lesson, I suppose, but it is difficult to learn it, and smile!"

THE MAZAWATTE BIG PURCHASE OF TEA.—We are indebted to Messrs. Gow Wilson & Stanton for some interesting particulars sent to us in regard to this big transaction. We are glad to learn that the effect on the market was good and that it is likely to be even better on consumption. There is this great fact in favour of the Mazawatte Company that they do not quote "the best" teas at inadequate figures in their retail business.

STORED PADDY.

SERIOUS REPORT FROM THE N.-W. PROVINCE;

DISEASE IN EVERY PART.

KURUNEGALA, May 24, 9 15 p.m.

All the divisions of the Kurunegala districts report attack on stored paddy by species of weevil insect compared to what is known commonly among natives as gullas. It begins the attack from the bottom of the granary. The grain is completely eaten up, leaving the husk only, which contains minute perforations.

The Ratamahatmayas of Hatpattus have sent in reports with samples of paddy with insects to the Government Agent.

Considering the ravages caused by cattle murrain, and paddy cultivation for yala season being unsatisfactory throughout the district, the present outlook is very gloomy, especially as there will be a dearth of seed paddy for cultivation.

The unattacked paddy, when separated by winnowing from the damaged grain, has been pronounced as unfit for human consumption and is said to taste bitter. Prompt enquiry into this matter becomes urgently necessary. Some splendid showers have fallen today and the sky is still threatening.

THE CACAO DISEASE INVESTIGATION: MR. J. B. CARRUTHERS' PRELIMINARY REPORT.

We direct attention to the Report supplied by Mr. J. B. Carruthers to the Cacao Sub-Committee of the Planters' Association, and by it, wisely sent to the press for publication. We have only been able to give the Report one hasty perusal—and that often interrupted—so that we are not in a position to discuss its conclusions and suggestions with the careful thought which they and all the contents demand. For, our perusal has amply sufficed to show that Mr. Carruthers does not deal with superficial observations or hasty inferences; but that his work right along is not only placed on a truly scientific basis, but is most thorough in all its details. We are indeed surprised that Mr. Carruthers has been able to tell us so much as he does, after the comparatively short term he has been at work. Recalling the experience of Mr. Marshall Ward and the period required for his investigation of the coffee-leaf fungus and for working out the life history of the same, we were prepared for a long interval of observation and inquiry without much of tangible results—that is, results that could be laid in popular language before the planting community. But here Mr. Carruthers gives all concerned a very large amount of information and arrives at conclusions both of a negative and positive character of great importance. This is the more satisfactory because we really think Mr. Carruthers has a more difficult task than that before Mr. Marshall Ward. There was no doubt before the arrival of the latter in the island, of the fungus that was working all the mischief in coffee; it was described by Dr. Thwaites; named and scientifically placed by Berkeley and its ravages were apparent all over the country. Still, of course, its life history and course of operation had to be worked out, and this was done after a masterly fashion by Mr. Marshall Ward who was then enabled to

show how futile were all the attempted remedies, and how absurd were some of the theories as to disease in the soil, in the roots or in the sap of the bushes. But in regard to Cacao, Mr. Carruthers seems to have a more complex problem inasmuch as he has two enemies or two forms of attack to deal with, the fungus inducing canker in the system of the tree and the fungus or canker attacking the pods. On his arrival in the island without that amount of previous preparation in reading up the literature on Cacao plant diseases, or on this particular disease which might have helped him,—Mr. Carruthers found himself all at once in a paradise for fungi. The estate in which his work lay shewed the disease on trees of all ages, and apparently in all situations. On the richest, as well as on poorer, soils; in sheltered as well as exposed situations and in different aspects. This was not an encouraging state of things for the investigator; but as a fungologist he no doubt was satisfied with the abundance of specimens of the fungi which would be available to him. He first of all demonstrated that the disease was not in the roots or leaves; but when he came to the fruit, the case was very different and the large percentage of pods lost through its operation indicates how important is the investigation entrusted to Mr. Carruthers. He shews how readily damage due to drought or helopeltis can be distinguished in the pods from that which arises from the fungus and then we have a description, more or less technical of the experiments made, and a careful description of the external signs (from the earliest appearance) of the canker.

Finally, we have a very valuable summary of the problems Mr. Carruthers recognises as still awaiting solution, and for which he is preparing to carry on his further investigation. It is too soon to talk of possible preventives or cures as anyone may see from noting the stage arrived at. But we feel that Mr. Carruthers is on the right track to arrive at useful results as regards preventives if not remedies, and that he should have a unanimous vote of confidence at this stage and be encouraged to go on as deliberately and thoroughly as he has begun. It may be said that one of the two suggested forms of amelioration—the diminution of “shade,”—would mean going from the frying-pan into the fire, as likely to induce helopeltis. Mr. Carruthers recognises this possibility and nothing but practical experiment can show in what the safe or happy medium consists. Far less doubt will be felt about the propriety of burning affected branches or pods as soon as the disease is observed. Finally we trust all cacao planters will carefully study Mr. Carruthers' instructions, so as, if possible, to carry on observations and experiments for themselves with such notes as may prove useful in connection with the main investigation. We consider that Mr. Carruthers has already fully justified his appointment to this investigation and we sincerely trust the future course of his work will still further demonstrate the value of his services to the Cacao Planters of Ceylon.

COFFEE IN MEXICO.—A very unfavourable report about Mexican investments will be found elsewhere; but with “good coffee” selling in London at 28s per cwt., the prospect everywhere seems poor?

CACAO DISEASE INVESTIGATIONS.

INTERIM REPORT BY J. B. CARRUTHERS.

In this report I propose to confine myself almost entirely to a statement of observed facts as far as they seem at present to lead to a knowledge of the cacao disease; but many facts observed are unrecorded here, and may at a future time be of use when a final and fuller report on the investigation is submitted.

Leaving England at short notice I had no time to make myself acquainted with any literature which might bear directly on these diseases of cacao if any such exists, and, therefore, on arriving here began *ab initio* in my researches into the cause of the deterioration and death of the diseased trees.

The Director of the Royal Botanic Gardens very kindly placed at my disposal the result of his observations on the disease, as well as all the information he had accumulated from planters and other sources, and the two most valuable circulars issued by him showed me the knowledge of the disease possessed by planters up to that time.

At the estate where I began my work I was fortunately able to see diseased trees of all ages, both of Forestero and Red Cacao, and had every facility given me for experimenting on these and on healthy trees.

The fact that trees of all ages, from three or four years upwards, in the best and richest soil and in favourable aspects, were attacked, and that trees apparently in a most healthy condition became victims to this disease, pointed to its being the result of extraneous parasitic organism—either plant or animal—no animal injuries could be found *exclusively* on diseased trees, and therefore the supposition that it might be due to a fungus was a fair one, and I at once proceeded to learn if this was the case by discovering the fungus and endeavouring to induce it in a previously healthy tree.

The conditions favourable for the growth of fungi are moisture and heat; the latter of these is always sufficient in this country, but the former is more occasional. At the time of my arrival the North-East monsoon was providing a time most advantageous to fungi, and I spent the first week in collecting and examining all the fungi I found upon the cacao tree. Here I may say that one of the difficulties in an investigation of this sort is the very large number of fungi to be found in the cacao like all other plants, which are either saprophytic, *i.e.*, living on dead trees or dead portions of a tree, or merely superficial, like the Lichens. Both these classes are of little interest in this investigation, as the former, though often occurring with the disease, are an after-effect, appearing when the damage is done; and the latter have, as a rule, no effect whatever on the health of the tree. But the difficulty lies in distinguishing between these and the parasitic fungus which is the real cause.

In order to discover the nature of a fungus and to learn its life history, it is necessary to observe its reproductive organs, just as in identifying flowering plants the flower must be found. Two methods can be followed in such a research, either to discover the fruit of the fungus in the field (and this is naturally a not very easy matter, owing to the small size of the reproductive organs of fungi), or to place some of the mycelium or roots of the fungus under conditions most favourable to their reproducing themselves, and keep them under close observation.

The difficulty in this latter method, especially in this country, is the large quantity of Bacteria, Torulae and other organisms which it is almost impossible to exclude from the cultures, and which destroy the fungus under observation.

In the case of the cacao disease it was necessary in the first place to form some conclusion as to portions of the tree affected. The examination of the roots of badly diseased trees showed no sign of fungus, and

other facts of importance in this connection are that trees, which are badly attacked, if cut down to within a few inches of the ground will produce from the remaining portion of the stem suckers which are perfectly healthy and produce sound leaves and fruit; also that seedlings planted only a few inches from a badly diseased tree—so that their respective roots must be intermatted and touch at many points—grow vigorously without any signs of disease. These facts lead me to the opinion which, I think, I shall farther prove in this report that *the disease does not affect the roots.*

On coming to the examination of the stem and branches in diseased trees, patches on the bark can be observed with the naked eye, in some places claret-coloured drops exude from the bark, and where these drops had presumably run over the surface, a characteristic rusty skin is produced, the patches were darker in colour and damp to the touch, and on cutting into them the tissues are found to be discoloured, their natural colour being changed to a neutral tint or claret colour. On examining these portions microscopically the tissues are found to contain the mycelium (that is the vegetative portion) of a fungus, and also in large quantities bodies of more or less spherical shape, the nature of which I at first thought to be fungal, through a certain resemblance to the rest spores found among certain groups of these plants—they, however, can be dissolved in hydrochloric acid, and therefore I consider them to be cluster-crystals of Oxalate of Lime, the nature of which I am investigating and hope to elucidate. These bodies, however, have no connection with the fungus and are therefore of less importance.

The leaves are free from fungi and, in cases of a tree having died from disease, present all the appearances, on microscopic examination, that the leaves of a tree dying from want of moisture would have, thus showing that there is no disease in the leaf, but that the death of the stem having cut off the supply of nutrition from the root, the leaves have died with the rest of the tree.

On coming to the fruit I noticed a very large number of dead and diseased pods of all sizes from an inch long, many of which were covered with saprophytic fungi and had died from causes which I hope at some future time to discuss; but others—and these the larger ones—were attacked by a disease which, from its occurrence on trees otherwise absolutely healthy and from its non-occurrence on cankered trees, I came to the conclusion has no connection with the canker, and the experiments which are afterwards described support this view.

The disease can easily be distinguished from the blackening of pods owing to drought or *Helopeltis*. It begins either at the point or at the stalk of the pod, almost never (about once in a hundred) in the middle, and creeps along the pod showing a well-defined boundary of brown tissue encroaching on the yellow, red or green healthy tissues of the pod. If the pod is cut this will be found to discolour the whole of the tissue not to be merely a superficial injury as in some other cases of browning or blackening.

The damage that this pod disease has caused in Ceylon I cannot yet say, but where I have observed it, it has probably produced a loss of 15 to 20 per cent of the annual crop by attacking pods that were approaching maturity, and if the number of young pods killed and never picked were included in this estimate the figure would be much higher. This percentage is for the whole year; during the wet season—favouring the growth of the fungus—more like 50 per cent of the crop was destroyed or rendered of much inferior value.

A microscopic examination of the discoloured tissue showed the quantities of mycelium, which was larger and of a different character from the mycelium in the stem, and a portion of it was placed under observation in a culture apparatus. After a few days the mycelium began to produce branches at the end of which egg shaped bodies are borne. These egg-shaped bodies are seen to contain circular bodies, and are no

doubt the sporangia or fruits of a fungus which belong to a group of plants, the greater number of which are parasites in the tissues of flowering plants and to which the well-known Potato disease belongs.

A few days later I was able to confirm these observations by collecting from a pod in the field these same reproductive organs on the surface of the pod.

The fruit of this fungus can be easily recognised by the naked eye as a white mould occurring chiefly in the furrows of the pod. The rapidity with which the fungus completely permeates the comparatively soft tissue of the pod is shown by the experiments recorded later, and an important economic factor in dealing with this evil is that, after the pod has been well attacked by this fungus, no further nutrition reaches the seeds and they are found to undergo no increase in size. In the case of the younger pods where the seeds are still touching the husk, the fungus spreads into and destroys them, but if the pods have approached to that point of ripeness when the seeds are free from the sides of the pod then the mycelium of the fungus does not cross the space and the seeds are untouched.

Having thus examined the whole tree and come to the conclusion that the stem was the seat of the disease causing the death of the tree, I began to watch carefully for any outward sign of a fungus which was causing the canker, but for some time without success. I also carried on many cultures of diseased bark in the hope that I might get the fructifications under these artificial conditions. All these cultures, however, fell a prey to the enemies I have mentioned before without having produced any reproductive organs.

However, on January 24th I found a white exorescence on the cankered portion of a Red Cacao tree, and on microscopically examining it found it to consist of a mass of mycelium bearing oval-shaped thin walled bodies which I placed under hourly examination in a drop culture. In the course of 12 to 15 hours these bodies began to push out tube-like processes in diameter about a quarter the breadth of the oval bodies.

The processes in some cases grew more than ten times the length of the oval body in 18 hours; many of them sent out two tube-like processes, in some cases, three, and these frequently coalesced so that a string of two or more up to six or seven were all growing into one tube. These tubes grew and branched frequently, and after 50 hours produced some smaller branches slightly conical in shape, at the end of which were a number of spherical bodies, which, after a few hours, were seen to consist of bodies of the same shape as the original spores, and these in their turn pushed out tube-like processes in the same manner as previously described.

These facts leave no doubt that these oval bodies are spores. Spores are the portions of a fungus capable of producing a new individual, and they may for practical purposes be considered as the seeds of a fungus.

During the few weeks following the discovery of these white sporophores on the bark of the Cacao, I found them on many trees in different parts of the Estate, and collected and examined a large amount of material. A fortnight later I found a sporophore which contained bodies of a different kind to the previous spores. These new bodies were about six times as big as the former spores and crescent shaped or in the form of a bent cylinder and usually 8 septate—i.e., divided into 8 or less compartments. On placing these bodies under conditions favourable to their development they pushed out tubes from one or more of their compartments, and these tubes grew and branched until destroyed by bacteria and microscopic animals. In some cases in one sporophore I found both these spores occurring; the smaller oval spores forming the mass of the outside of the sporophore and only a few of the larger spores occurring.

As is well known to students of mycology, the fact of these two kinds of spores does not necessarily

point to there being two fungi, as many fungi produce different kinds of reproductive bodies, and my observations lead me to expect that in this case there will be a third kind of spore which will be found and will complete the reproductive bodies produced by this fungus. But as I wish this report to deal only with observed facts, I will not enter into any details with regard to this third form of spores.

With regard to the experiments which have been occupying my attention. In the first place I experimented with the pod disease and in the following manner: I took a number of pods in different stages of ripening and inoculated them, inserting into a small space previously cut a piece of diseased tissue taken from another pod. I put the diseased portions in at varying depths and at different parts of the pod—thus, one was near the stalk and almost superficial, and another was much deeper and half way down the pod. In all the pods the disease was speedily induced, and in some of them in five days the whole pod became brown and the tissue full of the mycelium of the fungus. Those pods that were inoculated near the end of the pod took the disease soonest, and as might be expected, where they were inoculated more deeply it began first. After some 8 days the spores of the fungus were produced in the furrows of one or two pods. From these facts we learn that the time taken for the disease to destroy the pod is comparatively short (as is the case with most fungi inhabiting soft tissue), I should estimate about ten days from date of attack, and much less than that from the time the disease is first noticed on the pod.

The experiments with regard to the canker in the stem were more elaborate. I selected a number of trees 5-7 years old in different parts of the estate, and chiefly in new clearings of both Forastero and Red varieties, all of which to all appearances were entirely free from disease, and whose tissues showed no sign of mycelium when examined under microscope. These I proceeded to treat by inoculation. The method of inoculation adopted was to make a slanting cut so as to expose all the different tissues from the cortex to the old wood and to insert by means of a paint brush the spores, or in the case of those inoculated with diseased bark to insert a thin slice, and these cuts were then bound up firmly.

I used some 30 trees and treated them in the following way:—

1st. 13 trees inoculated with the smaller spores, which I have previously described.

2nd. 6 with the secondary septate spores.

3rd. 10 with diseased bark containing mycelium.

In each of these treatments both Forastero and Red Cacao were used, and in one or two cases suckers were also treated.

Since these experiments were being carried on in an extremely dry season and the atmosphere was very different from the rainy times when the disease undoubtedly spreads, I wished to imitate as far as possible the conditions which are to be found in the wet seasons and so place these inoculated parts under the most favourable conditions for the germination of the fungi. I therefore kept them damp by means of moist paddy straw, which was tied on to the tree, and re-wetted daily, after I had examined the case; in cases where the sun had access and was likely to dry this up rapidly I placed shades over the part treated.

These were carefully watched for any sign of the disease, and, as will be supposed, those inoculated with the diseased bark containing the mycelium were the first to show any sign, and first of all a Red Cacao produced the sporophores of the fungus after 9 days, and all the other Red Cacao, followed suit and acquired the disease with the exception of one tree in which the wet straw treatment had been intentionally omitted. In the case of the three Forastero trees treated with diseased bark, one has, up to the time of writing, taken the disease and the other two are in a suspicious condition.

In the eleven cases treated with the smaller spores, six were Forastero and seven Red Cacao.

Three of the Red have developed symptoms after more than 15 days, and one of the Forastero.

The cases treated with secondary spores (those described as crescent shaped and septate) have none of them at present shown any sign of the disease.

The external signs of the canker are being carefully observed and recorded and permanent microscopic preparations made of its various stages, as well as many other observations and drawings which at present have no significance, but which, with the progress of the investigation, may be useful in throwing light on many questions of interest.

Usually the first external sign of disease is a moist spot on the tree with often a drop of claret or brown coloured liquid exuding from it. When this runs over the surface of the bark it gives it a rusted appearance—later the sporophores burst through the bark at different places, being at first white in colour and changing gradually to a red or brown—the size of these sporophores varies from that of a pin's head to almost the size of a pea, and the shape is as a rule round or oval. In the cases on older bark they are forced through the cracks already existing in the bark, and thus they appear more or less in vertical lines. The tissue is at first of a neutral tint, and later becomes brown and finally dark claret coloured. In most of the cases observed the fungus seems to spread more rapidly round the tree than vertically, but the rapidity of growth varies in the different trees and no opinion can be as yet formed as to this most important matter.

The three trees not kept moist by means of wet paddy straw have none of them acquired the disease and this during the recent dry weather is as expected. In regard to the trees which have developed symptoms of the canker, those inoculated with tissue containing the mycelium would not usually be sooner affected than those treated with spores—just as transplanting is quicker than growing from seed. No doubt much valuable knowledge as to means of prevention or cure will be gained from these trees as well as that for which the experiments were instituted, the observation of the different stages of growth of the fungus.

With regard to the future work, the main questions still to be solved by observation and experiment are the following:—The conditions of heat or dryness which will prove fatal to spores. The time—if any special time exists—for the formation of each kind of spore. The means by which the spores gain entrance into the tissues of the stem, whether they first germinate outside the bark or get in by a wound—and in this connection it must be remembered that the spores being of such a minute character need no appreciable wound. To give some idea of their size—in the case of the small spores first mentioned more than 50 million would be required to cover with one layer a square half inch, which is about the same superficial area as a ten cent piece.

Another extremely important question on which I am making many observations and experiments is the questions of the effect of heat and dry atmosphere on the cankered spots of the tree. I have observed in many cases that the characteristic moist claret coloured tissue dries up, and on cutting has all the appearance of dead wood. In these cases the mycelium is not to be found in a microscopic examination, and if present at all must be in a dried up and probably entirely lifeless condition. The conditions which bring this about and whether the tree subsequently forms new and healthy tissue at the spot are problems which must be discovered. The question of the effect of cutting out portions of the canker how far in bad cases it is practicable, and what measures should be taken, if any, for protection of the wound is of great practical importance and will be experimented on at different estates where the conditions vary.

So far as these investigations have gone—and they are of course in an incomplete state—though certain

facts have been established, yet it is too soon to talk of possible preventives or cures—and a cure in these cases of parasitic fungi in permanent parts of a plant is always a more difficult problem to deal with than a prevention.

Until a complete knowledge of the enemy you are dealing with has been gained, all experiments in these directions must be empiric and to a certain extent unsatisfactory, yet it may be well to state the facts already learnt and what precautions they teach us to take. In the case of the canker the malady is due to a specific disease caused by a fungus which inhabits the growing tissues of the stem, and in the pods such a disease caused by a different fungus also exists.

As I have previously observed, the conditions necessary for the growth of fungi are moisture and heat—the heat in Ceylon is always sufficient, but the moisture can be to a certain extent controlled. During the rainy seasons the atmosphere continues moist where the sun is not shining, but when the sun is up, unless the place is too densely shaded the atmosphere must speedily become too dry for the germination of spores. It is thus most important that a minimum of shade should be employed—the amount of shade necessary for the profitable cultivation of cacao—to prevent attacks of *Helopeltis*, to protect from wind, and other reasons are questions which experience in planting shows, and which I will not presume to advise, but from my point of view, as far as the canker is concerned, this shade should be reduced as far as possible.

It also follows from the observation already made that a great risk is run by allowing any bark on which the sporophore or spore-bearing portions are present to remain on the trees, and all this should be destroyed by burning, which is the only absolutely effectual means of ensuring destruction of fungi. This also applies in the case of the pod disease, which should be stamped out if care is taken to destroy the husk of every pod as soon as it is observed to be attacked.

Any report until the life history of the fungus has been entirely observed, and the rate of growth of its different stages determined is, to a certain extent, unsatisfactory, and therefore it is of great importance that those interested in the cacao disease should remember that this is only a portion of the result of an investigation carried on as far as is possible on scientific principles, and that hasty conclusions on data more or less incomplete, are not likely to materially help in the eventual elucidation of the questions of prevention and cure.

J. B. CARRUTHERS,

March 26th, 1899.

ADDITIONAL NOTE AS TO EXPERIMENTS.

On many Cacao Estates the superintendents reading this report may be inclined to themselves help on this investigation, and, therefore, a few remarks as to experimental work which they could do may be of use.

The most important point in carrying out such experiments is exactitude in recording what has been done, and after observation what the effects are at regular and frequent intervals. No doubt much useful information will be gained if the data are carefully recorded, and it is hardly necessary to specify the exact knowledge to be got by each experiment. I will therefore briefly state one or two examples of how to treat such cases.

1. To cut out carefully the whole of a cankered part taking care that no discoloured tissue remains behind and leave the wound so made to the drying influence of the air, and also, if possible, to take a stem which gets direct sunlight on it. (Neither of these experiments of course could be expected to succeed in thick shade).

2. To cut as in No. 1 and treat the wound with tar.

3. To cut as No. 1 and treat with Bordeaux mixture as recommended by Mr. Willis in his report, viz. :—

Copper Sulphate (Blue stone)	..	6 lb.
Quick Lime	4 lb.
Water	45 gallons.

4. To scrape the cankered parts without entirely cutting them out and apply the mixture.

5. To cut out strips about one inch apart and about one inch in breadth in the cankered parts and treat as before.

In all the cases of using copper sulphate as a fungicide, its liability to being washed off is a difficulty, and experiments with regard to modifying this are important. They may, however, be left to the ingenuity of the individual experimenter if it is always remembered that the basis of the application must be the blue stone. In France molasses have been used, and this mixture resists the action of the rain remarkably well, using only one tenth of the weight of molasses to that of copper sulphate. Dextrine linseed oil and other substances have been used, but what is of course best is to use a cheap locally produced substance which can be readily obtained.

If these or any of these suggested experiments are carried out I shall be obliged if those superintending them will communicate with me, so that I may take advantage of the information gained and also, if possible, inspect the trees myself. J. B. C.

PLANTING NOTES.

RUBBER TREES AS SHADE—are discussed and it is stated that on Arapolakande in the Kalutara district, trees ten years old along the roadsides, &c, seem to do no harm to tea. The Para Rubber tree may be different; but the experience gained of mixing Rubber (Ceara) trees and other products in the Dumbara Valley was not satisfactory: Mr. Vollar had to cut them out as injurious to his coffee and cacao. Tea is no doubt a hardier plant; but it would be well not to presume, although boundary lines of Rubber trees might be allowed.—Since writing this, we have had the benefit of the opinion of an authority who knows as much about Rubber on plantations as any man in Ceylon, and gives it as his belief that Para Rubber trees put out in tea, if 50 feet apart, do no harm on lowcountry plantations. It is well to know this.

DR. MORRIS, C.M.G., &C., of Kew has just delivered (April 18th and 25th) two of the Cantor Lectures before the Society of Arts taking for his subject "Sources of India-rubber." Dr. Morris is good enough to send us (specially for the *Tropical Agriculturist*) concise summaries of both lectures; but meantime the following Syllabus of the Course will show their interest and comprehensiveness :—

LECTURE I. April 18.—Distinction between caoutchouc and gutta-percha—Occurrence of latex in plants—Constituents of latex—Natural orders yielding caoutchouc—Methods of extraction—Coagulation of latex—History of india-rubber—Progress of industry—Imports into United Kingdom—Relative production in foreign countries and British possessions—Uses—Value of total trade—Forms of commercial india-rubber—Present yield—Future supply—Para rubber-trees—Geographical distribution—Conditions of growth—Yield—Quality of rubber—Methods for collecting and preparing rubber—Commerce in Para rubber.

LECTURE II. April 25.—Peruvian and Bolivian rubbers—*Castilloa elastica*—Conditions of growth and exploitation in Mexico, British Honduras, Guatemala, Nicaragua and United States of Colombia—Venezuela and Guiana—Mangebeira—Manicoba or Ceara—Mattogrosso—African rubber plants—Distribution of Landolphas—West African—East African—Mozambique—Madagascar rubbers—Lagos silk rubber (*Kaokoia*)—Methods of preparation—Present condition of industry—Commerce—New sources of supply—Assam—Penang—Sumatra—Java—Borneo—New Guinea—Fiji—Cultivation of India-rubber plants—Prospects in Mexico, Brazil, West Africa, Ceylon, Malaya,

Correspondence.

To the Editor.

BOUGHT TEA LEAF—AND INDIGENOUS
JÂT—VERSUS LOW AVERAGE PRICES.

Ambagamuwa, April 19.

DEAR SIR,—Talking on the subject of tea prices, I met a gentleman the other day, who was realizing a 7d to 8d average whilst his neighbour on the adjoining estate was only able to get 6d. I naturally remarked “you are plucking fine?” “No”—said my friend—“I go round every 9th day; you cannot call that fine plucking!” “No”—said I—“I do the same, but yet I cannot get up to your average.” My friend promptly put in,—“But you buy leaf outside don't you? that accounts for it.” There is much in that, no doubt. Same evening I met his neighbour and in course of conversation reverted to the talk I had with the other neighbour and told him all. “Well,” said he, “he may be plucking medium but don't you know he has a very large acreage of low jât Hybrid or China tea and this generally helps to give him the prices!” If this theory is correct, I fear our indigenous teas have had much to answer for, for the present depressed state of the market. I always firmly believed in a good Hybrid. It will do its 500 lb. per acre with cultivation and give a fair average, while the indigenous, with its fabulous yields, helps to put in a coarse tea in every grade and thus brings down our average. Indigenous, I say, above 4,900 feet, nowhere else.

C. T.

[This is surely rank heresy? “Indigenous” grows best at a low elevation and the finest field of “China” in the island is at Nuwara Eliya.—ED. T.A.]

BONE-MEAL, NITRIFICATION, AVAIL-
ABLE PHOSPHATES.

Colombo, April 25.

SIR,—Referring to the subject of the Value of Bone-dust as a Fertilizer, dealt with in an article which appeared a short time ago in the T.A. I beg to offer a few remarks. It has been pretty well demonstrated by Professor Wagner and others that, in temperate climates, and for most crops, phosphoric acid is more economically supplied in the more readily soluble forms, such as superphosphate and Thomas' phosphate powder, than in bone meal. This is more especially the case with crops which require much phosphoric acid, and which have to be matured in a few months. Thus, for cereal crops, which remove per acre 20 lb. or so of phosphoric acid from the soil in a few months, soluble phosphates have a great advantage over undissolved bone manures. The advantage is not so great in the case of dairy pastures, which remove about 12 lb. phosphoric acid, and remove it in more regular proportion throughout the year. Hence, for the manuring of permanent pastures, undissolved bone manures are still much in request.

For tropical products, which assimilate much phosphoric acid, as, for example, the sugar-cane, the great superiority and economy of soluble phosphates over bone-meal has likewise been demonstrated. The canes alone of the sugar-cane plant remove per crop 40 lb. phosphoric acid, and 41 lb. of nitrogen per acre. The soils in the sugar-growing Island of Hawaii are particularly rich in organic nitrogen, and in phosphoric acid; but both of these indispensable elements of plant food are present, for the most part, in a comparatively inert state. Thus the Director of the Hawaiian Experimental Station says,

that “50 lb. of nitrogen, given in an available form, is of more moment to the growing crop than the 17,000 lb. of organic nitrogen lying inert in each acre of land.” In like manner, it might be stated with regard to the phosphoric acid in these sugar-growing soils, that an application of phosphoric acid in the soluble form is of scarcely less moment to the growing crop than the large quantities at present existing in these soils; but rendered comparatively inert by being in combination, to a great extent, with iron and aluminum. On these soils, bone meal produces but little effect except in the wettest districts, whereas the response to an application of soluble phosphates is most marked and the effect almost immediate. If an organism, capable of nitrifying the large stores of inert nitrogen could be introduced into these soils, little nitrogenous manure would be required. Meanwhile the planters find the most profitable manures are sulphate of ammonia and soluble phosphate, while the formula for manures most generally recommended by the Agricultural Bureau gives six per cent nitrogen, eight per cent phosphoric acid soluble in water, and potash to suit individual soil.

An abundant crop of tea, say 800 lb. per acre removes 39 lb. of nitrogen from the soil, and is therefore, comparable with the sugar-cane in this respect; but even an abundant crop of tea removes from the soil only a little over six lb. of phosphoric acid, so that here comparison does not hold. It has to be borne in mind however that the tea prunings from good average bushes have been shown to take up somewhat more phosphoric acid and considerably more nitrogen than are removed by crop. The tea crop, thus, requires much nitrogen, and only a moderate amount of phosphoric acid, and this explains the present system of manuring, according to which phosphoric acid has, for the most part, been supplied from the slowly available form of bone-meal, while the applications of nitrogenous manures have been on a liberal scale. The soils in which bone-meal gives the best results, are soils with plenty of organic matter, and very little carbonate of lime. The presence of much carbonate of lime hinders the decomposition of bone-dust, no doubt owing to the fact that the solvents of the soil act more readily on the carbonate than on the phosphate of lime as it exists in bone-manure. Ceylon soils contain very little carbonate of lime. Hence the solvents of the soil, carbonic acid, the more complex organic acids, and nitric acid, are more free to act on the bone phosphate. It is the custom to add nitrogenous organic manures, such as oil-cakes, along with bone manure; the decomposition of these produces acids which assist in bringing the bone phosphate into an available state. More than a fourth part of the bone dust itself consists of organic matter, and contains about 4 per cent. of nitrogen. The complete nitrification of four parts of nitrogen produces 18 parts of nitric acid; which, if saturated with lime from the bone phosphate, would remove therefrom eight parts of lime changing part of the phosphoric acid into more soluble forms. In like manner, the nitrogen of the oil-cakes by nitrification reacts on the bone meal. We thus find that the subject of nitrification, besides having a direct interest as nature's method of rendering organic nitrogen fit for plant food, has also a collateral interest, as assisting in the process of rendering the more stable phosphates, such as bone-phosphate, available for plant food. It is interesting, therefore, to note the results of some experiments, on a small scale, published by Ph. Bonome on the rate of nitrification of the organic matter in a typical soil of Mauritius, and of certain nitrogenous manures, all of which are used in our Ceylon tea-soil. The Mauritius soil is rich in nitrogen, and poor in lime, and the climate favourable to nitrification. In the unmanured soil, nitrification was greatly promoted by an addition of carbonate of lime, and still more so by caustic lime. The nitrogenous manures experimented with were Sulphate of Ammonia, dried blood, oil-cake and fish guano; and the result of a series of experiments, without addition of carbonate of lime or lime, showed that fish guano nitrified

the most readily, then cake, then dried blood, and, last of all, Sulphate of Ammonia, which nitrified very slowly. The rapid nitrification of fish guano explains why tea responds so readily to this manure. Boname remarks that "probably nitrification is assisted by the presence of Calcium phosphate and carbonate in the organic manures." Certainly, when chalk was added, along with the nitrogenous manure nitrification was hastened in every case, the order of nitrification being then sulphate of Ammonia, dried blood, oil-cake; no experiment with fish guano being recorded. I note, however, that in this experiment the chalk was added in very large proportion viz. 5 per cent. of the soil. The slow nitrification of Sulphate of Ammonia in the absence of carbonate of lime, and the beneficial results obtained by its application to crops, are regarded by Boname as supporting the view, that, under some conditions, plants can directly utilise salts of Ammonia. Seeing then that lime, or carbonate of lime, hastens nitrification, and liberates potash, an explanation seems to be required why the general experience of tea planters is unfavourable to the liming of tea soil's. The only chemical reason which suggests itself to me is, that, by liming, the available phosphoric acid is not increased *pari passu* with the potash and nitrogen. Little, therefore, of the extra potash will be utilised, and much of the nitrogen wasted as, when nitrogen has been turned into nitrate of calcium, it percolates through the soil gradually, and is lost with the drainage water. Mr. Baur, whose articles on manuring have been read with much interest, is quite correct in his view that by the use of phosphate and of potash in readily available forms, the proportion of nitrogen in manures may be reduced. This may be regarded as a general principle in manuring; and, now that soluble phosphates and salts of potash have been brought within reach of the planter, it ought to be made matter of experiment how far the general principle enunciated is applicable to a perennial leaf-crop like tea. Several of the experiments with Thomas' phosphate powder suggested in the pamphlet published by Messrs. Freudenburg & Co. have this for their object to see how far the nitrogen in tea manures may be reduced by the use of Thomas' phosphate powder and sulphate of potash; thus, four of the experimental mixtures contain each only about two-thirds of the amount of nitrogen commonly used; one contains only one third of the amount, and one contains no nitrogen at all.

Mr. Baur's fertilizers for tea, supply phosphoric acid in a different, but very available form, together with salts of potash; and, although the nitrogen is in much smaller proportion than in the tea manures commonly used, it is, nevertheless, greater in amount than in the manures recommended and used with success for cereals, which take up fully as much nitrogen from the soil as average crops of tea. The great advantage of phosphates soluble in water is their initial diffusibility through the soil. They gradually relapse into the less soluble forms, but, in a very fine state of division, readily acted upon by the acids of the root fibres or hairs. I might cite one instance which appears to me to tell in favour of using more available phosphatic manure than bone-meal, together with a reduction in the proportion of nitrogen in manures. A short time ago, I had a soil to analyse from a very fertile tea estate, yielding in years of good rainfall over 1,000 lbs. dry tea per acre. I naturally expected to find this soil very rich in nitrogen; but, on the contrary, the nitrogen was scarcely of average amount; but the soil was rich in phosphoric acid and potash. The soil was a fine red soil, containing a good deal of oxide of iron and alumina; and, although the soil was in a fine state of division, it allowed water to percolate through it with sufficient freedom to ensure very good aeration. It was a soil evidently well fitted to utilise the natural supplies of nitrogen.

M. COCHRAN.

TEA MANURING.

Central Province, April 28.

DEAR SIR,—You invite attention to the recent correspondence and circulars of the Manager of the Ceylon Manure Works; and it is somewhat remarkable, considering the vital importance of the subject, that you have not had ample pabulum to deal with in your columns. Too much time has been given to useless discussion of Exchange and Currency questions, and now Wars and Plague are likely to distract busy planters. And that word 'busy' reminds one that probably the men whose opinions are most worth having, from their extensive experience, are the very men who cannot spare time for newspaper correspondence, valuable though it is at times to our community. However, I venture to try and lead the way, in the absence of others better qualified, and hope some useful results may be attained.

And firstly it may be taken for granted that if Government will not assist us with an Agricultural Chemist, the P. A. should take up the question thoroughly. Having agreed to pay for the analyses of the cacao tree to assist cacao planters in determining the best manures to use, it should extend that principle to tea. Certain well-known tea gardens always secure stand-out prices, owing to the flavour, point and strength of their teas. Let these be analysed and compared with analyses of medium and low-grown in Ceylon, and let the analysis be a thoroughly exhaustive one. It is amply proved that elevation alone will not account for the superiority of high-grown teas. Climate certainly accounts for much, and if the micro-organism theory of nitrification is proved true for the tropics, then one can understand gardens in sheltered valleys with moderate rainfall and a fair share of sunny skies suffering less in periods of drought than estates in exposed, cold, wet and cloudy situations, the absence of extremes being favorable to growth of these organisms and consequent ample supply of nitrogen. To a certain extent a judicious selection and distribution of shade trees and wild belts will moderate the effects of both cold damp and extreme drought, and leguminous trees would undoubtedly add to the sources of nitrogen. The absence of red-rust too is often most marked under certain shade trees, e.g., some abuzzias and jak. Trenching in shade loppings (where lay of land permit) manna grass and young-lantana would also improve mechanical conditions besides enriching soil. Personally I believe the less we use artificial manures the better; but in many cases they are absolutely necessary for many palpable reasons. How far the quality of the soil influences flavor has yet to be discovered, also how far jat is accountable. I know of two gardens which were planted almost entirely from Indian Indigenous, or the old Horagalla seed, and for some time stand-out prices marked these places, but in the latter case it is no longer the happy experience now; and in the former the prices are rapidly approximating the general average of the district notwithstanding every advantage of soil, climate and well-equipped factory. There seems good reason to believe that young tea in new soil will always give better flavor especially in the higher districts. But in the lowcountry I fear the cause of inferiority is incurable, owing to the too rapid growth of flush not allowing time for the mature elaborating of all the elements needed to give a strong well-flavored tea. Experiments with Baur's and Freudenberg's manures should be undertaken at different elevations.

The Kirkoswald experience is valuable for that district; but it is a question whether it would be equally satisfactory in Kelani or Kalutara.

Can any of your readers give us the results of using "Basic slag?" (Thomas' phosphate powder). Iron is a capital tonic, and it should prove a powerful vegetable stimulant in a phosphatic form.

On the principle "train up a plant in the way it should grow" the importance of the subject of manuring can hardly be exaggerated. 'Tis all very well to advocate finer plucking but personally I should commend more careful plucking, which need not necessarily

be finer; on the contrary it may be needful to make it coarser, as it is palpable that higher yields are necessary in the majority of cases at any rate as a counter-poise to lower prices. If we all plucked fine tomorrow, fine teas would no longer be scarce and down would go the prices for fine teas. The wretched packet dealers are the cause of half the mischief, as I said long ago (though you would not admit the argument sound), cut-throat competition, and then absence of rival bidding by large buyers, account for the almost bottom prices now reached. (THEY are wise enough to see that having established large sales of low-priced teas, it is against their interests to bid against one another as they cannot raise RETAIL RATES; and their advertising costs a pretty penny). No sir! we must go in for quantity more than ever keeping up quality as far as possible by careful plucking; strict attention to plucking "bhanjy" when young and tender, and leaving no leaf, to be plucked "hard" next round; and instead of paying off S. D.s wholesale, give them a bonus on the increase of yield resulting from careful plucking. The kanganyas, and often conductors help their favourite pluckers, instead walking in the rear across the line of pluckers continually and checking bad work. An S. D. on his mettle is worth the whole crowd of native overseers, because he can throw enthusiasm into his work and make it contagious. And give the best pluckers a monthly bonus and the rivalry established will bring down cost of plucking more effectually and honestly than half-naming.

What has all this to do with manuring? Well, I take it manuring is intended to increase yield, and many of us have to use manure in the abstract, and substitute *SHOE-LEATHER* in the concrete. In the absence of profits, revenue or capital, we must capitalise our sense, energy, ingenuity, resourcefulness and see what brains and bootleather combined with courage and willingness will do towards tiding over adverse circumstances, which threaten to become worse ere they improve. We want loyalty all round, between employer and employe equally. Mutual self-sacrifices, a little less play perhaps, and more hard intelligent work (no crimping labour!), and to fight TOGETHER for an enterprise upon which we can fearlessly ask God's blessing. The supply of pure wholesome Tea, is more or less a missionary enterprise against intemperance and drunkenness, against unwholesome water, and as such we can feel that after all, if we have enabled the poor workers at home to get a cup of decent tea at a price more proportionate to their means. We have lost a little coin, perhaps, but gained the good-will of the consumer, and done some good in our lives.

The consciousness of this should help every one of us to go on and do better, and as I said before pray for God's blessing on, and guidance in our work.—I am, yours faithfully, T. K.

SCIENTIFIC AGRICULTURE IN CEYLON; AND THE SCHOOL OF AGRICULTURE.

SIR.—Before very long, the state of civilization of a community will be gauged by the state of its Agriculture and the quantity of artificial manures it consumes. That Ceylon is on the high-way of civilization, accepting the above as a correct test, is attested to by the fact that in our midst has arisen a gentleman with sufficient courage and belief in the future of Agriculture, to devote his time and talents exclusively to the sale of manures.

Hitherto the trade in manure, not a very large one, was in the hands of Agency houses with many estates in their books. The sale of manures was carried on as a subsidiary operation. Even at the Hiltisdorf mills the sale of manures was simply an adjunct to larger and more important undertakings.

Mr. A. Baur with commendable courage, foresight and belief in the future, has started Manure Works to which he devotes himself exclusively. The difference between his works and those of other manure sellers, is that his operations are carried on on scientific

principles and he has called to his aid Mr. Hughes, who is by far the most competent Agricultural Chemist to advise on manures suitable for Ceylon soils.

Mr. Baur has addressed a letter to the "Observer" on the manuring of tea which has called forth high commendation in its editorial columns. The letter is not altogether free from the taint of self-interest and of the advertisement of one's wares, but the communication does not on that account lose one jot of its value. I do not use the word "taint" in any offensive sense, for I am of those who do not regard it as a reproach for an individual or for a community to advance, his or their interests by all honest and fair means. Mr. Baur has supplied what he has felt to be an acknowledged want. His action has not been impelled by philanthropy, called by cynics the guiding principle of fools. While benefitting himself, he wishes also to benefit Agriculture, the backbone of the Island's prosperity. He finds Agriculture rather shy and backward in the use of manures. It is a duty he owes himself and his constituents to place before them all the literature on the subject of manures and manning which he has made it a duty to study.

Mr. Baur says, and truly, that in European Agriculture, manuring is a necessity; out here it is regarded as a luxury. I endorse this, but not the reasons he adduces for it. Competition is very great for the products of European Agriculture, the margin of profit, owing to prices for produce and high rent, is very small, so that unless farms are forced to yield high returns, farmers go to the wall. The condition of things is, or rather was, different here and Planters have the means of extending their borders as soon as some fields become unremunerative. With exchange and prices against the planter, he may recognize that the time for liberal cultivation, not using the expression in its accepted sense, has arrived and he may see the wisdom of going in for scientific manuring. Mr. Baur mentions why this cannot be generally resorted to viz., the absence of Agricultural Chemists to guide the planter. He suggests that the Government keep a staff of Agricultural Chemists to aid the planter. That is rather a "tall order." My suggestion is a more modest one, that an Agricultural Chemist be attached to the School of Agriculture in the same way that a Veterinary Surgeon is and that his services be made available to the public on payment of a moderate fee; this to be regarded as private practice.

The Government re-organized the Technical School and transformed it into a College without much loss of time. A Commission has been brooding over the School of Agriculture for an unconscionably long time. Its report has not yet seen the light of day. No doubt technical education is very useful and Government can, from the College, draw supplies for many of its departments. But it must not be forgotten that Agriculture is the mainstay of the Island, and the maintenance of the School of Agriculture as a College is of paramount importance. The important part that agriculture plays in the island's welfare can be fully realized at the present time when the tea industry is threatened. If at the present time we had an Agricultural College with a properly equipped staff, the service of its agricultural chemist would be available to tea planters to advise them how to economically manure their properties, i.e., to advise them what manures to use to yield the largest possible results. The present unscientific, and hap-hazard system is wasteful in that we apply in abundance ingredients tea plants take up in small quantities and which may be present in the soil, and in niggardly doses what is wanted in abundance. Besides, there is the further economy of an increased yield in many directions, and notably in the cost of plucking and supervision.

As in the case of coffee planting so in that of tea wide and unbroken areas are planted with one single product. Great care must therefore be taken to avoid fungoid pests and for this reason specially prepared manures in the use of which there will be no danger of infecting the soil, is of great importance.

The subject of fixing free atmospheric nitrogen in the soil in supersession of nitrogenous manures can-

not profitably be discussed at the present time. The matter has not advanced beyond the stage of experiment even in European Agriculture. The possibilities of it are proved in experimental plots and over small areas. On no large scale has the use of soil infected with nitrogen-fixing organisms been used in lieu of nitrogenous manures. Experiments have proved that these organisms exist in the nodules to be found on the roots of a certain class of plants or in the soil in the immediate vicinity of their roots. It yet requires demonstration that if a field be planted with these organism-yielding plants and be thoroughly infected, subsequent crops could be raised without the application of nitrogenous manures. If this can be satisfactorily demonstrated, then local planters can grow these crops and draw their supplies of nitrogen from the exhaustless atmosphere instead of from the manure merchant.

Mr. Baar, following the teaching of all Agricultural Chemists, preaches the use of readily soluble manures. I hold quite heterodoxical opinions on this subject. I do not believe in blindly following the teachings of Science. We must adopt them with discrimination and suit them to varying circumstances. The circumstances of European and local Agriculture are not identical. The books on Agricultural Chemistry treat almost entirely of the cultivation of cereals and annuals. The life of these is of a very short duration, and it stands to reason that if manures applied to them are to have effect, they should be in so highly soluble a condition as to be immediately available, otherwise they will lie dormant in the soil or be washed out of it. Not so in the cultivation of perennials, the roots of which are in constant occupation of the soil. No application goes to waste, as the processes of absorption and assimilation are continuous. When annual applications of manure are not possible, I think it an advantage rather than otherwise, to use slow-acting manures. Otherwise trees are stimulated into yielding heavy crops and unless they are kept up with annual doses of manure fall off considerably. This was why guano was discredited in the cultivation of coffee. If it had been applied well mixed with a slow acting manure like cattle manure or in compost heaps, its use would not have been avoided. I have observed a similar result follow the use of too-readily available manures in Coconut Cultivation. B.

HEAVIEST DAILY RAINFALL.

DEAR SIR,—As you observe, the rainfall of 31.72 inches which fell, (or is said to have fallen) in 24 hours at Nedunkeni in the Northern Province on December 15th and 16th, 1897, is worthy of a special report. The heaviest rainfall at any place on the globe is, as is well-known, on the Khasia Hills, where it is 6.90 inches a year, of which 500 inches fall in seven months. In this neighbourhood it is recorded, no doubt as a noteworthy occurrence, that Dr. Hooker measured 90 inches in three days. We are unfortunately not given the heaviest daily rainfall, but at all events Nedunkeni would seem to be a formidable rival to Khasia.* Mr. E. Heelis in his paper on the climate of Dimbula mentions that "in 1872 the rains began on June 2nd and never ceased for a quarter of an hour together during the day time nor, I believe, during the night till the 17th July." The highest rainfall last year was at Padupola with 243.07, and the lowest at Kayts with 33.39 inches. Garret gives the following averages for other places on the globe, and it would be interesting to compare these with our own records: London, 23.5; Bordeaux, 25.8; Madeira, 27.7; Havannah, 91.2; and St. Domingo, 107.6; these figures being given to prove that rainfall decreases from the equator to the poles. Karachi in Sind does not, I believe, get more than five inches per annum (and anyone verify this fact?); while Poona gets only about seven inches I think.

Has anyone heard or read of a daily rainfall heavier than 31.72 inches?—Yours truly, D.

* Only as regards daily maximum: its annual average (for 3 years) is only 64.70 inches; but 1897 gave 121.85 inches.—Ed.

[Port Said only gets 2 inches a year; Alexandria 8 inches.—We are assured the return for Nedunkeni is correct; but surely there must have been something of the nature of a waterspout, seeing the annual fall is so moderate?—Ed. T.A.]

RUSSIAN TEA BUYERS IN COLOMBO.

SIR,—I see by the *Tropical Agriculturist* of April 1st, pag 695, that two representatives of the firm of Popoff "were met by Mr. A. H. Thompson, the tea maker with whom they have been engaged the greater part of the day testing tea for Wednesday's sale." This would have been a glorious opportunity to test my plan of paying subscriptions to the foreign market funds in tea and not in money. I would have taken Messrs. Isgarcsoff and Daniloff to the tea rooms, having in my possession a list of subscribers, thus.

No. 1	Subscribers	R100.00
" 2	"	R500.00
" 3	"	R450.00
Others	"	R3,950.00
		R5,000.00

and I would say to them, "Gentlemen you can have the tea of any of these subscribers at 1-16th less than the sale price. Here is a lot of No. 3 subscriber, a pekoe valued at (so many) cents, there are 45 chests, you can have 20 of them at 1-16th less than the price the rest sells for, I pay you the difference to induce you to sell it in Russia. We will let you have 20,000 lb. from this sale, another 20,000 3 months hence, and again another 20,000 the next quarter. Next year again we will let you have the same quantities from the same gardens at the same quarter of the year, in the same terms, that is to say, at 1-16th less than the price the tea actually sells for to other and less favoured buyers." I certainly would expect the above representatives to jump at the offer, and then the subscribers would have paid their subscriptions in the best possible form, i.e., in tea and not in cash.

When you have wanted your tea to go to the merchants, you would have had to pay for 300 chests or so, four times a year, he would be certain that he could get the same sort of chop next year, and he would get into the habit of buying big lots, even when the discount is stopped and when he has to buy at the ordinary market rate. Let us see how much tea can be introduced on these terms. R1,000 is equal to 16,000 annas of Indian money. (I don't understand your Ceylon currency) consequently R50,000 is equal to 800,000 annas and at 1 anna per pound you could send out 800,000 lb. of tea. There is little doubt that this amount of tea introduced into Russia would do more good than 50,000 rupees spent in cash, on advertising &c. &c. &c. But of your 100 million pounds of tea you could easily afford to sell half million at 1-16th less than its market price, and sell it to merchants who will do all the advertising and drumming. The way I look on the problem is, that unless you favour some merchants by giving them large lots of tea, at a substantial discount, the present buyers will take this discount out of you by paying lower prices. If there is more tea than the regular buyers want, they will pay you smaller prices, but if you withdraw the surplus and give it to outsiders at a discount, the regular buyers will not reduce their offers.

Supposing that you have established a market for the sale of 100 millions at an average of 6 pence. Next year you offer 101 millions, the price will go down to say 5 15-16 pence and every one suffers. But should you withdraw the one million extra and give it to Messrs. Popoff at 1-16th discount, the price will not fall, and the extra million will be securely placed in a good market. It is very probable that the tea so placed will have been very profitable to the favoured merchants. The next year they will take the same amount at a discount, but it is very probable that they will take twice the amount at the ordinary market rates. 1874.

DUTY ON TEA IN RUSSIA, &c.

SIR,—It has struck me that your powerful Planters' Association might do something towards lessening the tea duty in foreign countries by having a direct understanding with the Government of said countries.

There is no doubt that the object of imposing duty is to secure revenue, and not to favour China or home products so that the expected amount of revenue being secured, the Government would not very strongly object to the import of more tea.

Would it be impossible to guarantee (say to the Russian Government) the estimated amount of revenue on condition that 1-3rd more tea should be allowed free of duty. In other words, ask for a rebate in the duty, and deposit the deficiency as security that 1-3rd more tea would be imported into the country.

One-third is perhaps a large figure to begin with, but whatever proportion is deemed advisable would probably be accepted.

Now that Ceylon tea is just finding its way into foreign countries the idea is within reach of possibility.

The scheme is in the nature of a wager. We bet you so many thousand pounds that if you reduce the duty by 1-3rd your country will take 1-3rd more tea and it is highly probable that your country will take one-half more tea and you will gain by increased revenue. There is not the faintest doubt that this principle continued year by year would reduce the duty in Russia to 4d and increase their revenue six-fold within ten years.

The deposit would only be duty paid in advance, but perhaps the oiling of the wheels would cost a great deal.

It is hard to understand, why high duties should be placed on tea, but our own country has shown the benefit of reducing the rate. Our people are not nearly as fond of tea as the Russians, but consumption has increased with each remission in duty, and the revenue has increased.

Tea is not a commodity of which several years supply could be laid up, so there would be no fear that the merchants would import more than was required for the year, in order to benefit by the low rate of duty. Any increase in imports would be permanent.

The remission of a part of the duty, under the conditions proposed could be used to gain popularity if the transaction could be kept secret.

1874.

ALL ABOUT BIG TEA SALES.

London, E. C., May 6.

DEAR SIR,—By this mail we are sending you a copy of last Wednesday's *Daily Mail* which gives an account of the competition going on amongst large rival Blending Houses for each one to prove itself the largest distributor in the trade.

The fact of paying a duty cheque amounting to £63,147 means the clearing of nearly four million pounds weight of tea, and in order to do this a considerable quantity had to be purchased in recent sales, an order for the purchase of over 20,000 packages being placed in our hands for execution by the Mazawattee Tea Co. This led to a good deal of competition and without doubt did good to the market for both Indian and Ceylon teas, having the effect of lifting it out of the low groove into which it had got and giving a decidedly more healthy tone to the sales.

The *Daily Mail* mentions us as having purchased one "break" of over 10,000 packages; this is an error, and we expect they really referred to the fact that we purchased in one public sale for the Mazawattee Tea Co. some 10,523 packages. This we think is the largest contract for tea ever sent in from one firm to another.

We send you a copy of the Mazawattee advertisement and of their cheque, as we think it will probably be of interest to you; copies of the latter are being widely circulated throughout the whole country.

The previous record duty cheque was one paid by Messrs. Liptons some short time back for about £51,000. We think that such powerful advertisements as those made by the two firms named, cannot do otherwise than help to increase tea consumption, not only in this country but abroad where the information may be spread.—We are, dear sir, yours faithfully,

GOW, WILSON & STANTON.

"CEYLON PLANTERS' TEA UNION."

May 14,

DEAR SIR,—I notice in a home paper, an advertisement of the "Direct Supply Stores" proprietors; The English Farmers' Association Ltd., Holborn circus.

Substitute "The Ceylon Planters' Tea Union" as proprietors; find *the man*; and you have one remedy for vanishing profits. It would be to the interest of every agent, planter, proprietor and superintendent and S. D. in Ceylon to become a shareholder. Let the grower get the middleman's profits and we shall hear no more of that bug-bear exchange for some time to come. Very few understand the question and still fewer have time to spare to study the subject *But we can all back up a Direct Supply Association.*—Yours faithfully,
T. K.

CEYLON FISHING CLUB.

Nuwara Eliya, May 20.

DEAR SIR,—As the affairs of the Ceylon Fishing Club may possibly be of interest to a good many of your readers, I venture to send you for publication a list showing the distribution of the trout fry which have been hatched out during this season. The total result shows that 11,788 fry were successfully hatched: of these 600 died owing to various accidents on the way to their destination; leaving a net total of 11,188 which have actually been put into the various streams. This may be looked upon as a satisfactory result, reflecting great credit upon Mr. Elhart, who really bears the brunt of the delicate and anxious work at the hatcheries. The best thanks of the Club are also due to the gentlemen who kindly and skilfully superintended the distribution.—Yours faithfully, S. M. BURROWS,

Hon. Secretary.

DISTRIBUTION LIST.

- 1,250 to Kurundu Oya, Bulahal Ela, and Halgran Oya.
- 50 to Stew Pond, St. Leonard's.
- 800 to Sita Eliya Streams.
- 500 to Elk Plain Streams.
- 800 to Amhawella Steams.
- 600 to Streams in Dimbula.
- 600 to Streams on the Boppts.
- 300 to Streams in Maskaliya.
- 400 to Kurundu Oya (High Forest).
- 3,015 to Nuwara Eliya Streams.
- 3,273 to Horton Plains Streams.
- 200 to Stew Pond, Nuwara Eliya.

A LEAF FROM THE PAST.

Colombo, 20th May, 1898.

DEAR SIR,—I found the enclosed photograph of sketches made by C. R. Hall, in looking over some old relics of the past:—(1) "The last days of coffee killed by leaf disease, grub and bug"; (2) "In 1883, dawn of prosperity in the midst of ruin." Exchange was much higher then and freights three times as high as they have been for years now. Still prices for coffee remain the same in the markets of the world, and but for disease, Ceylon would have remained prosperous with good old coffee.

Fifteen years have passed and we have had times again. No disease this time; exchange lower; freights ditto, and over-production cannot be pleaded—*it is quality*. Why don't some-one try coffee again? or would the disease revive with the revival of coffee?—Yours faithfully,

L. S.

[First, the price of coffee has fallen very much of late owing to bumper crops in Brazil; secondly, ordinary coffee when planted, is at once beset with its old fungus-enemy, nor does Liberian escape. Many have been the experiments made with new coffee seed:—Mocha by the late Capt. Bayley; hybrid-Coorg-fungus-proof seed in Dumbura, and Liberian on a big scale in the Kelani Valley; but we fear few if any have answered. —The allegorical sketches sent to us are clever and interesting, and full of melancholy reminiscence of a time of dire disaster in Ceylon: we sincerely trust that days so dark and depressing may not visit us again.—Ed. T.A.]

PADDY AND WEEVILS.

Colombo, May 23.

DEAR SIR,—A serious trouble seems to threaten the villagers of Sina and Hapitigam Korales.

When I was there last week, I was informed that paddy of the last crop belonging to several people is rendered utterly useless by the grains of rice in the husk having disappeared within a short time of the paddy having been stored in the granaries. I have scarcely a doubt as to the cause of the mischief being the weevil. Why paddy of this particular crop should be so weevily, and whether future crops will be liable to the same danger would be worthy of investigation.

Both well-dried and stored *hill* and *field*-paddy are said to be growing equally bad. In a short time, unless a remedy, easily available to the villager, is prescribed to him without delay, to arrest the progress of this evil, his prospects until the next harvest will be gloomy.—Yours truly,

AGRICOLA.

RAW RICE AND OUR CEYLON COOLIES.

SIR,—I think I am right in saying that a few years ago 100 bags of raw rice would have been difficult to sell at Colombo. Lately several thousand bags have been landed and the "Lancashire" is now landing about 15,000 bags.

What becomes of this rice? Is not the Tamil coolies' preference for so-called boiled rice a mere fad, and if the raw rice were is need to them with tact would they not very soon become accustomed to it and accept it freely? Get a little of each kind and try it and you will find there is very little difference. If the Tamil coolies can be induced to use the raw rice, there only remains the question of cost, and there would be no need to send Commissioners to Rangoon.—Yours,

UNIVERSAL PROVIDER.

LOTUS LEAVES: (NYMPHÆA LOTUS.)

DEAR SIR,—It is not generally known that there is a brisk trade carried on in Colombo in Lotus leaves. In the ponds and fields in the suburbs, men and boys may be regularly seen in the mornings collecting these, which they tie up into bundles and carry into the different meat and fish markets in the town, and they are readily purchased by the fishmongers and butchers. These leaves are used for wrapping up fish and meat sold, in the same way as paper is in the Western markets. Every servant who goes marketing, if he does not carry a bag or a basket is supplied by the market man with a leaf or two, in which to wrap up his purchases, the charge made is $\frac{1}{4}$ cent for a couple of leaves, thousands of leaves are thus sold daily and a lucrative trade is carried on by the collectors. It is a strange irony of fate that the sentimental Lotus of Poets should be put to such ignominious uses! —C. ["To what base uses may we come Horatio!" —Ed. T.A.]

DRUG REPORT.

CINCHONA.—Last week's Amsterdam auctions contained a total of 625,862 kilos. of bark 1,376,896 lb.) of which 592,300 Jilos. (1,303,060 lb.) was manufacturing bark and contained the equivalent of 28,874 kilos. (1,010,590 oz. of quinine sulphate. The average quinine value was 4.85 per cent. the lowest bark containing 1.28 per cent, and the highest 8.61 per cent. The unit varied from 4.75c. to 6c., the average being 5.20 against 4.25c. paid at the April sales. Bark containing 7,482 kilos. of quinine (260,870 oz.) sold at 5c., and all but 1,971 kilos. of the rest at from 5.25c. to 6c. There was nothing of particular interests in the sales, and as our space this week is limited the foregoing particulars must suffice. The next sales will be held on Thursday, June 9th.

ORL. LEXONGRASS.—A quiet market, at $4\frac{1}{2}$ to 5d per oz.—*Chemist and Druggist*, May 14.

THE INDIAN TEA CROP.

The General Committee of the Indian Tea Association have issued the following figures showing an estimate of the Indian tea crop of 1898:—Original estimate of crop of 1898:—Assam, 63,851,592 lb; Cachar, 22,181,980 lb.; Sylhet, 26,630,540 lb.; Darjeeling, 8,145,520 lb.; Terai, 3,101,600 lb.; Doocars, 25,795,480 lb.; Chittagong, 982,000 lb.; Chota-Nagpore, 193,600 lb.; Kangra, 1,800,000 lb.; Dehra Doon and Kumaon (Estimate), 2,000,000 lb.; Private and Native Gardens (Estimate), 4,000,000 lb.; total, 153,681,312 lb.; being 10,428,904 lb. over the actual outturn of the crop of 1897. Estimating shipments to America the Colonies and other Ports, with local consumption at 18 millions, there will remain about 140½ million lb. for export to Great Britain.—*Friend of India*, May 26.

CEYLON TEA COMPANIES.—The Directors' Reports of two more well-known Companies—the "Scottish" and "Rangalla"—will be found on page 848. Both suffer from the hard time of low prices and high exchange, the dividends of the Scottish falling from the usual 15 to 10 per cent. for 1897, and that of Rangalla from 10 to 6 per cent. The estates in both cases are reported to be in good order under excellent local management.—We have also to draw attention to our special report of the proceedings at the first annual meeting of the Ceylon Proprietary Tea Estates Company which owns the Beaumont Group in Pussellawa, as well as some Maskeliya (Forres) and Dimbula (Rade la) estates. That 5 per cent of dividends should be declared the first year and under present circumstances was rightly deemed satisfactory and the shareholders seemed well-pleased with their prospects, voting bigger fees to the Directors than they desired to have!—Incidentally we are sorry to learn that Mr. F. H. Wiggan, the Company's manager in Ceylon, though at home, was ill in hospital,

SEASON REPORTS FOR THE MONTH OF APRIL, 1898.

ESTERN Province.—Paddy. Yala sowing going on; somewhat delayed by want of rain. Fruits and vegetables scarce in Kalutara district, but the supply was good in the Colombo district. Health of cattle good, but at Welipeenna some animals died “of an unknown disease.”

Central Province.—Paddy. Maha harvest nearly over, prospects good generally. Rainfall at Matale 6·08 in.; no disease among cattle.

Northern Province.—Paddy. Crops reaped and stacked. Tobacco crops good and harvesting and curing is going on. Rainfall at Jaffna 1·04 in.; at Mannar ·69 in. Health of cattle good.

Southern Province.—Paddy. A beginning of Yala cultivation has been made and in some places the plants are in blade. Rainfall 5·5 in. at Galle, dry in Hambantota. A few cases of foot and mouth disease among cattle,

Eastern Province.—Paddy. Munmari harvest nearly over and Pinmari cultivation commenced. Rainfall 1·63 at Batticaloa against 4·6 last year. In Trincomalee the rainfall measured 5·45 in. Health of cattle good.

North-Western Province.—Paddy. Yala cultivation going on in most places; crops fair. Cattle murrain prevails in some districts. Rainfall at Puttalam 2·66 in;

North-Central Province.—Paddy. Maha crops being reaped. Murrain reported in Eppawala Korale and Kelegam tulana. Rainfall at Anuradhapura 4·2 in.

Province of Uva.—Paddy. Maha crops ripening but suffering for want of rain in some parts. Fruits and vegetables plentiful and cheap. Health of cattle good.

Province of Sabaragamuwa.—Paddy. Yala crops progressing where sown already, sowing still going on. No rain during the month at Kegalle.

EXTENSION OF AGRICULTURAL EDUCATION IN INDIA.

The following is taken from the Resolution of the Government of Bengal regarding the opening of new agricultural classes at Sibpore:—

The scheme of agricultural education to be provided at Seebpore includes two classes. The course of study to be followed by students in the upper class, qualifying for the higher diploma, is intended to train students for employment in the higher branches of the Revenue and cognate services, or for employment as managers and sub-managers of estates, or as tahsildars and land stewards. The course of study for the lower class will be suitable for candidates for the office of kanungo and other subordinate posts in the Revenue service. The theoretical course for both classes will be limited to 14 months, including vacations, from June of one year to August of the next. During the eight months from November of the second year to the following June, it is contemplated that the students of both classes will receive practical instruction on the Seebpore farm, as probationers on Government and Court of Wards' estates, and that they will make excursions to the Burdwan and Dumraon experimental farms. Dr. Leather, who was recently Agricultural Chemist to the Government of India, has also suggested that the students should visit the Allahabad and Cawnpore Farms, and Mr. Keventer's Dairy farm at Aligurh.

The higher course of study will be open to students of the Engineering College who have passed the F.E. examination at the end of their third year, who will already have studied chemistry, physics, mathematics, surveying, levelling and drawing. It may be also arranged, so far as the available accommodation will permit, to admit to this class B.A.'s nominated by Government who have passed by the B. course, or other students of sufficient educational attainments so nominated. The subjects to be taught in the upper class during the 14 months' course of agricultural study are agriculture, organic and agricultural chemistry, and laboratory work, botany, physiology, geology, meteorology of hydraulics, book-keeping, and zemindari accounts. Arrangements may be made for students to attend lectures in veterinary science at the Veterinary College, and special lectures will be given on the culture of lac, indigo, sugar, etc., as shown in Appendix A. to this Resolution.

The syllabus of lectures prepared by Mukherji and revised by Dr. Leather, late Agricultural Chemist to the Government of India, which is printed as Appendix A. to this Resolution, is provisionally approved, but will be subject to such modification as may be found necessary. The lower course of study will be open to students of the College who have completed their second year in the apprentice department, and to teachers sent from training schools with the sanction of the Director of Public Instruction. The course will include agriculture, surveying, workshop practice, botany, and zemindari accounts. At the close of their terms of theoretical study, the students of both classes will be examined in the subjects prescribed in their course, and successful students

will receive from the Principal of the College, in the higher class, a diploma; in the lower, certificate of proficiency. On the conclusion of the further term of practical training, and after further examination, the diplomas and certificates of those students who satisfy the examiners will be countersigned by the Director of the Department of Land Records and Agriculture, and will then qualify the holders for employment in the higher or lower grades of the Revenue and cognate services.

His Honor the Lieutenant-Governor is prepared to assign one appointment annually in the Provincial Executive Service, and one in the Subordinate Executive Service, to such of the holders of agricultural diplomas as he may think most deserving of or suitable for these appointments, and will also consider favourably applications for nominations to be given to such students, authorising them to compete at the examination for candidates for admission to the Provincial, Executive, and Opium Services, provided the applicants are, in other respects, considered by him to be suitable for admission to these services. Students who hold certificates of proficiency in agriculture will be eligible for employment in the Subordinate Services as kanungos in the Canal Department and under the Court of Wards, and as normal school teachers. But it is not possible, at present, to state how many such appointments can be given each year to the holders of agricultural certificates.

For the present, students in the agricultural classes will not be required to pay tuition fees, but board, lodging, and lighting must be paid for at the ordinary scale; accommodation for students will be provided in the hostel attached to the College.

Senior scholarships held by students when passing the F.E. examination will continue to be tenable in the agricultural classes during the fourth year; the number of such scholarships at present open to all the senior students of the Seebpore College is 10, viz., 1 of R20 a month, 3 of R15 a month, 6 of R10 a month. In addition to these scholarships one graduate scholarship of R30 a month, tenable in the fifth year, will be awarded on the result of the fourth-year examination. To students of the apprentice department who join the agricultural classes, ten reduced feeships of R2 a month will be allotted, tenable during the 14 months of their theoretical training. During the final year of training, four stipends of R10 a month will be awarded on the results of the final agricultural examination.

OCCASIONAL NOTES.

The following are the names of the students at present forming the Forestry class:—Messrs. Seneviratne, Rowlands, Tiallonis, Ferdinands, Perera and Rajapakse.

We are glad to hear from Mr. E. Elliott of the results of experiments with two varieties of Paddy which were sent to us from North India as being among the best cultivated in that locality. Writing to us, Mr. Elliott says: "I will send for exhibition (to the Fruit and Flower Show) some

paddy grown from the Bengal paddy seed you gave me, and which has produced 45-fold, and beautiful rice. The other variety gave 49-fold, but is not such a nice rice." Mr. Elliott is anxious to get 20 bushels of each for his next sowing. We are also glad to hear that Mr. Elliott is doing well with ramie fibre, and has got rid of the gum from the fibre without much difficulty.

As science advances, more and more attention is given to details, and it is found that often what are popularly considered to be very minor points often turn out of the greatest importance. As is well known in farming, to produce a good milker is considered to be somewhat of a lottery, and many a calf is reared for dairy purposes that would have been far more profitably converted into beef. Now, how are we to pick out these? A Swedish dairy newspaper—*Mejeriernas Annonsblad*—affirms that a discovery has recently been made, the truth of which has been proved by a first-class veterinarian, that makes it possible at the birth of a calf to judge if it will become a good milch cow or not. It has been observed that the palps, that are on the inner side of the cheeks near the corner of the mouth, have different forms, according to whether the animal is a good, a middle-class, or very inferior milker. The palps being large, broad and flat, denote that the animal gives a large quantity of milk. If they are only round, the milking qualities are of the most ordinary description. While if they are pointed the milk yield is of a most wretched description.

FURTHER INFORMATION ABOUT COCONUT OIL.

We have received the following notes from Cochin with reference to the manufacture of coconut oil there:—

From enquiries made in the matter, I could find no special causes, either in regard to the time of plucking the nuts, or in regard to the treatment of the trees or the nuts, or in regard to the method of extracting the oil, which can be called peculiar to Cochin. The methods throughout this coast, including British Malabar, Travancore, and Cochin are about the same.

The following information may, however, be possibly found useful:—

THE TIME OF PLUCKING THE NUTS.

The nuts are plucked every second month, *i.e.*, about six times a year. A greater number of pluckings than that is found to result in immature nuts being plucked along with mature ones, and this affects the purity of the oil, and also reduces the quantity extracted. The period of maturity, however, varies with the conditions of the soil and climate, and also the different varieties of the coconut palms.

TREATMENT OF THE NUTS.

The nuts are exposed *to the sun*³ for full seven clear days, *then only* are they found to give pure and uncoloured oil.

I am given to understand that, in Colombo, they dry the nuts in smoke. If this be so, probably the process may, to some extent, affect prejudicially the clearness of the oil.

METHOD OF EXTRACTION.

The extraction of the oil is done by means of the ordinary crude native machines constructed on the pestle-and-mortar principle, popularly known as the *chekku* in these parts, as also to some extent by means of steam-mills. No special method of extraction is known to be practised.

With regard to the term "Cochin oil," I have the honor to inform you that the term is almost unknown in those parts, and I heard of it for the first time from you. Perhaps, the people in Ceylon use the term to mean "superior oil," and the term might have originated in the real or alleged superiority of the oil imported into Ceylon from this part of the west coast.

THE LAW OF CATTLE TRESPASS.

The owner of a land has by law the right of seizing and detaining till payment of damages all cattle found straying therein.

The land should, however, before enforcing this right be securely fenced according to the custom of the country. Coffee, Tea, Coco Estates are not fenced by custom, and large Coconut Estates are also never fenced. Therefore the right of seizure and detention may be exercised by the owner or superintendent (servants) of such estates. When seized the owner of the animal should be permitted to feed them till payment and redemption.

It is not apparently incumbent on the land owner to bestow much care and attention to animals so seized, as in several cases where the cattle died the owner of the lands so detaining the animals were held not liable to pay their value to the owner of the cattle.

The remedy is two-fold, one by civil action for damages against the owner. The other a summary procedure in the Police Court under the provision of the Ordinance. In order to entitle one to summary procedure he should observe the following condition:—

As soon as the animals are seized he should give notice to the nearest Police Station, the Ordinance says within 48 hours. Failing a Police Station the native headman should be informed.

The Police Officer or the Headman, as the case may be, will at once proceed with one or more respectable villagers to assess the damages, to find out the owner and inform him &c. so that he may, if necessary, be present at such assessment and so on.

There is also what may be termed an extraordinary remedy. That of destroying the animal during trespass. But the party so destroying will be liable to the owner of the cattle in the value of the animal destroyed over and above the estimate of the damages. Often, however, the damages exceed the value of the animal destroyed: As in case of trespass on nurseries, Coconut Estates &c., no criminal action will lie against the owner of the land for the shooting. There is an extension of the right by bid which provides for a license under the hand of the Police Magistrate. In such a case no civil liability will continue.

The conditions under which the license can be obtained are the following:—That the trespassing animals cannot be seized, that the owners are not known, and that the animals cannot be identified.

THE USES OF WOOD.

(Continued.)

8. Wood is a poor conductor of heat and electricity. Heated to 150° F. or cooled below the freezing point of water, iron, steel, and other metals are painful to the touch, and even far within these limits metal objects are objectionable on account of their ready conductivity of heat. Wood, on the other hand, is entirely inoffensive as long as its temperature remains within the above limits. The objections to metal dwellings on this account are experienced also in heavy-armoured ships, which, in spite of the excellence of an oceanic climate, are notoriously uncomfortable and even injurious to health.

When exposed to heat, wood is ignited and destroyed by fire. The inflammability and combustibility of wood at high temperatures, though among its most valuable properties, are, at times, a drawback which metals do not share; nevertheless, during conflagrations the behaviour of wooden structures; for, while a beam of wood burns, it retains its shape to the last, and the structure may stand and be saved, while under the same circumstances metal beams twist out of shape and thereby occasion the fall of the entire structure. This behaviour of wood in conflagration has induced the best authorities, fire underwriters and others to recommend the use of wood in all large structures where the combustible contents of the rooms' annul the value of fireproof metal construction.

If wood were a good conductor of electricity, its usefulness as a material of construction in our large cities would be much impaired, for it appears to be a very serious and constantly growing difficulty to protect life and property against this dangerous and yet so useful force.

9. Woods are normally inoffensive in smell and taste; liquors and wines of the most delicate flavours are kept in oaken casks for many years without suffering in quality. Chemical changes, often directly producing poison, prevent the use of cheap metals for these purposes.

10. Owing to their structure, all woods present varieties of characteristic aspects and possess no small degree of beauty. A plain surface of metal, of whatever kind, is monotonous, while one of wood, unless marred by paint, presents such a variety of unobtrusive figures that the eye never tires of seeing them. That this beauty is quite fully appreciated is best illustrated by the fact that pianos, sideboards, and other elegant furniture are not covered with sheet metal (as they might very cheaply and effectively be), and that the handsome floors of costly structures are neither painted nor carpeted.

11. Wood is easily and effectively united by the simple process of gluing, so that valuable combinations, whether for behaviour, strength, or beauty, are possible. A three-ply veneer board may not only be as pretty as, but also more serviceable than, a simple board of any one of the two or three kinds of wood of which it is composed, and a white-pine door with cherry or walnut veneer is not only fully as handsome as a walnut door, but it is far superior in its behaviour. Since all shrinking and warping is thereby prac-

tically prevented, iron and steel may be welded, most metals can be soldered, but none of these processes can be compared to gluing in effectiveness and ease of operation.

So far wood has been regarded only as a material of construction; but while this is perhaps the most important consideration, the use of wood is a substance which may be altered physically and chemically is far more important than is generally admitted.

12. The great mass of mankind is warmed and has its food cooked by wood fires. Even in this country today, in spite of the great competition of coal, three-fourths of all the houses and thousands of manufacturing establishments are supplied with heat from wood.

13. Wood is ground into pulp and made into paper and pulp boards with endless variety of application. Wood pulp made by chemical processes, results in cellulose and its countless derivatives, which are capable of supplying almost anything, from a shirt collar to a car wheel.

CONDENSED MILK.

Fifteen thousand cows are required to produce the condensed milk of Switzerland. During recent years the condensed milk industry collectively, the new competitors do not approach the output of the pioneer country.

There are a great many condensed milk factories in Switzerland, most of which have sprung into life during the last five or six years, until Swiss milk brands in a shop window now present almost as bewildering a variety as the Swedish matches. The industry mainly depends, however, upon three large factories. The Henri Nestle Company, with its three works at Veney, Bercher and Payerne; the Anglo-Swiss Company, with factories at Cham and Guin; and the works of Lapp, at Epauvy. Henri Nestle, who, like so many modern captains of industry, started life as a pharmacist, was the pioneer of the condensed milk business. His invention proved a gold mine, and at his death, a year or two ago, he was reckoned one of the wealthiest citizens of the Republic.

THE PROCESS IS SIMPLE.

The process of the condensed milk manufacture is exceedingly simple. Almost every village in the district tapped by one of the factories, possesses a milk-collecting office, to which the peasants bring the milk fresh from the cow. The milk offices are owned by separate companies, with whom the factories contract for their supplies. At the collecting office the milk undergoes a refrigerating process. Upon its arrival at the factory it is first warmed gently over a vapour bath and then exposed to a greater heat (not, however, exceeding 176° Fahr.) in copper vessels. The next manipulation consists in the addition to the milk of 13 per cent by weight of the best refined sugar. The mixture is then pumped into a vacuum pan for condensation. There is nothing special about these vacuum pans. They are the kind used at almost every manufacturing chemist's, in sugar factories and in many other works.

WHAT GOOD CONDENSED MILK SHOULD CONTAIN.

The pans have a false bottom, and are fitted with spiral hotwater tubes. The aqueous vapours

given off by the milk, which is kept boiling under low pressure, is withdrawn through the suction-pump at the top of the pan. When sufficiently condensed, the milk is withdrawn from the pans, cooled in vessels placed in fresh running water, packed in 1 lb. tins, and hermetically sealed. Swiss condensed milk of good quality should contain from 10 to 10.30 per cent of fatty bodies, 8.75 to 10.25 per cent. Casein, 53.25 to 55.00 per cent of sugar, about 2 per cent of salts, and from 23.50 to 25.25 per cent of water. Condensed milk is exported to all countries of the world: South America and India take large quantities, and among the Chinese the milk is becoming popular as a jam, and eaten with bread. Since the commencement of 1890 an enormous impetus has been given to the Swiss condensed milk industry by the allowance of drawback of the duty on the sugar used in its manufacture. The immediate effect of this concession was an increase in the exports of over 20 per cent.

A DISEASE OF BUFFALOES.

The disease described in the following article from the *Veterinarian* is not unknown in Ceylon, and it has often been mistakenly identified with rinderpest under the comprehensive title of "murrain." Among the villagers it was recognized as quite distinct from "murrain" or *Warangata*. I believe the late Mr. Lye, when Colonial Veterinary Surgeon, investigated this disease and published a very interesting report in 1893, and was the first to describe it with any scientific accuracy. He termed the disease *Pharangis Laryngitis Contagiosa*.

GHOTWA OR GHOTU IN BUFFALOES.

Note by Veterinary Captain H. T. PEASE, F.Z.S., Principal, Veterinary College, Lahore.

Introductory Remarks.—The existence of a specific febrile disease of the buffalo and cattle, characterised by sudden attack, high fever, rapid swelling of the throat, difficulty in respiration, and death in a few hours, has long been known. Its true nature has never apparently been recognised, and it has gone to swell the returns under the head of "Anthrax"—a disease which it appears has to cover a multitude of doubtful cases. In my annual report for 1896 I referred to this subject as follows:—

"I have found on inquiry that in the majority of instances any disease in which there has been fever and swelling of the limbs or body, and specially of the throat, as well as cases in which death could not be otherwise accounted for, have almost invariably been returned as anthrax. I have found that the commonest disease returned as anthrax is a disease named *Ghotwa*, *Gharwa*, or *Galg'otu* in the Southern Panjab. In all the districts visited this was reported to be a most severe and dreaded disease, and ranked next in importance to rinderpest, attacking animals apparently perfectly healthy, running its course with alarming rapidity, the animals perishing in a few hours.

Rains favorable to the Disease.—It is most prevalent in the rains, but may appear at other

times of the year, and specially following the Christmas rains. It seems to be more prevalent in low-lying land subject to periodical inundation, but is by no means confined to such spots.

Authorities quoted.—The disease has been studied in other countries, chiefly in Salerno, Rome, and Terra del Lavo, by Oreste and Armanni; in Sardinia by Sanfelice, Loi, and Malato.

It has also been seen by Havas, Reischig Makoldy, and Gal.

The Disease as it occurs in Hungary.—Von Ratz states that in Hungary it exists under the name "Buffelseuche," prevailing in the summer time, and often causes great losses in buffaloes, which seldom recover from it. The disease appears very suddenly as a more or less circumscribed swelling of the throat, gullet, and head, and sometimes of the tongue, is accompanied by high fever and great difficulty in breathing. It resembles very nearly that form of anthrax described as "Gloss-Anthrax."

Usually attacks young healthy Buffaloes.—It attacks most commonly young buffaloes which are in good condition, but older animals also get it. Cattle and swine also take the disease spontaneously. Natural infection may occur in many ways. The entrance of the contagion may take place from the intestine or through the skin. It may attack old animals, but it is not common to see it in those of over six years of age. These have less susceptibility to disease than young animals. It is possible that this facultative immunity is in some cases due to recovery from a previous attack, but seeing the fatal nature of the malady this is not probable.

Probable causes of Infection discussed.—According to experiments the infection is caused by the material entering through the skin. At the same time infection experiments by the digestive canal remained unsuccessful, although with this object the same virulent material was employed which subcutaneously injected caused the fatal disease in a short time. In the winter-time, when animals are stalled, the fact that the disease may notwithstanding occur, proves that the infection may be introduced through the digestive apparatus by means of the food and water. This mode of natural infection is easily explained, when the beast has been wounded on the lips or mucous membranes by the thorns and stalks of rough dry food, as the virus may easily gain entrance by such wounds.

Symptoms of the Disease.—The disease is characterised by high fever, great depression, and circumscribed swelling of the throat. The affected buffalo remains behind the herd, appears dull and miserable, sluggish with drooping head and staring eyes. Soon it stands in one place immovable, very dull and depressed, and is perfectly indifferent to its surroundings. There is a discharge of ropy saliva from the mouth. The skin is dry and hot. The rectal temperature rises to 107° F. or more; the pulse is frequent at the commencement, 62—80 per minute, later scarcely perceptible.

There is acceleration of and great difficulty in respiration, with dilatation of the nostrils. It is rattling and noisy, often accompanied by a roaring sound which can be heard at a con-

siderable distance; the mucous membrane of the nose is cyanotic and covered with a discharge which also issues from the nostrils. The temperature of the buccal mucous membrane is increased, and the colour of a diffuse red. The rapidity of the appearance of a hot painful swelling, at first œdematous to the touch and circumscribed, later always hard, spreading around the throat, part of the face and about the ear, downwards towards the neck and the shoulder, is astonishing. This swelling varies considerably in size in different cases, and may in some be very small and circumscribed; in others, however, it is extensive, spreading over the lower part of the neck to the chest. It does not crepitate on pressure. In addition to the existence of the large swelling of the throat a yellow slimy discharge from the nose is observed. The tongue and the surrounding parts swell, the animal keeps the mouth open, and the tongue hangs out, is cyanotic and hard to the touch. With the extent of the swelling of the throat the difficulty in breathing and the noise keep pace. The inspiration is long, the expiration is shorter. To these symptoms may be added cessation of appetite, disturbance of rumination, and tympanites; sometimes the animal at the end of the attack stands with difficulty. There is trembling of the muscles of the croup. The dung is often serous and fluid, red-coloured and mixed with slime. In the last stage the animal lies down, the limbs stretched out, the respiration is frequent, difficult, noisy, very rattling, dyspnoic. This difficulty in breathing increases; the blood becomes more and more impure, spasms of the muscles occur, and soon the animal falls suffocated to the ground.

Ghotwa runs a very rapid course, often causing death in from six to seven hours from the first appearance of the disease. In most cases, however, it lasts for twelve to twenty-four hours, and it seldom runs for two or three days. If it lasts longer it may disappear and the animal recover.

Mortality.—The mortality varies, but is always high, 90 to 96 per cent. of deaths usually occurring. The epidemic is very sharp in the summer, and the mortality greater than in the cold weather. The individual outbreaks have a very short course, seldom lasting more than from eight to ten days, generally not so long.

Postmortem.—Section of the dead buffalo shows the swelling of the throat, face, and neck to be due to intense serous infiltration of the subcutaneous connective tissue. The skin over the swelling is stretched tense. The swelling itself is of tolerably hard consistence, never crepitating on pressure. On incision we find a greyish-yellow gelatinous material, with black bloody patches interspersed here and there in it. The same appearance is presented by the intra-muscular and intermedial connective tissue. The muscles are blood-red. In the abdominal cavity there is a yellow or red coloured serosity. The peritoneum is injected, as is also the serous membrane of the bowels. Mesentery injected, lymph glands swollen and of firm consistence, greyish or brownish red on section. The spleen medium in size, flabby, the capsule not stretched, the pulp reddish brown. The liver full of blood. The contents of the omasum dry, the mucous membrane pale. The

abomasum contains only a small quantity of pale slimy contents. Its mucous membrane is wrinkled, and at the summits of the folds are hæmorrhagic patches about the size of a bean. The submucosa is infiltrated, the vessels much injected. In the small and large intestines pulraceous and in part bloody contents are found; the vessels of the mucous membrane are injected and covered with punctiform and linear ecchymoses and blood markings. The kidneys may be congested or in course of parenchymatous degeneration.

The bladder contents are turbid; the mucous membrane injected. The chest cavity contains a small quantity of a reddish serosity; the parietal pleura is studded with disseminated hæmorrhages. The lungs normal in size, and studded with hæmorrhages of various sizes; the elasticity is impaired, and on section they have a brownish-red colour, partly dark red, and contain a red frothy fluid. In the bronchi and trachea is a reddish frothy fluid, the mucous membrane of the respiratory passage is uniformly red, that of the larynx dark red, tumefied and infiltrated. The epiglottis and vocal cords and the base of the tongue are tumefied, the submucous being the seat of œdematous infiltration. Tracheal lymphatic glands enlarged, firm in consistence, the section appearing juicy, yellowish brown, and studded with hæmorrhages. The retro-pharyngeal connective tissue is also the seat of œdematous infiltration, the peribronchial lymph glands are enlarged. The pericardium contains a reddish-coloured serosity, and is, especially over the right side of the heart, marked with petechiæ. The heart is flabby, the cavities contain small quantities of badly coagulated or fluid blood; there is subendocardial hæmorrhage. The cerebral meninges are light red, the ventricles reddish, and contain serous fluid.

In the blood-serum from the above-mentioned many bacteria, which in form, size, and morphology are identical with those described by Oreste and Armani ("Studi e ricerche intorno al barbone dei buffali," *Atti del R. Istituto d'incoraggiamento alle scienze naturali*, x, 1887). They resemble in their morphology those of fowl cholera (*Bacillus cholerae-gallarum*).

In gentian violet or methylen blue-stained cover-glass preparations may be observed a bacterium 0.9—1.18 μ long, and 0.4—0.6 μ thick, which is for the most part in the shape of proportionate rod, rounded at both ends. In the centre these rods remain uncoloured, but they are intensely coloured at each pole. The unstained portion does not appear to be always equal. In the small bacteria it is small, whilst the borders are diminished, so that it appears not unlike a biconvex lens. In the longer bacilli the unstained middle piece appears longer, and the boundaries are parallel. In some of the bacilli the uncoloured piece is about two-thirds of them, and only the two small rounded poles are coloured. Scattered amongst them we find also longer bacilli, which appear like two joined together containing two or three uncoloured spaces. Besides these forms are small oval and spherical bodies like cocci, and uniformly coloured with the exception of a small spot in the middle.

Besides in the blood, spleen, and infiltration the bacteria are found in the lymph glands, urine, and œdematous fluid,

Cultivation of Bacteria.—The best medium for artificial growth is agar and glycerine agar, in which they will grow luxuriantly. In the incubator at a medium temperature of 37° C. in twelve to fifteen hours in line cultures, shining dew-like little drops appear, which are partly scattered and partly run together as they grow. In the first case round colonies are developed; in the second a thin, transparent, greyish, and slightly opalescent film with unequal or jagged edges.

Line cultures in gelatine show in twenty-four hours at a temperature of 17° to 18° C. a fine white line, like embroidery, which with the aid of the microscope appears to be made up of small pearly fine granules gathered together into rounded colonies. In three to four days they form a yellowish irregular stripe, which is made up of numbers of small spherical granules. Gelatine plate cultures at 17° to 18° C. show in twenty-four to forty-eight hours under the microscope small colonies which gradually enlarge, and become in three to four days visible to the naked eye as punctiform, sharply bordered, yellowish, slightly shining small discs which do not liquefy the gelatine. Under a high power it is seen that these yellowish discs are composed of nearly smooth round granules.

Inoculation.—By inoculation with an artificial culture of this virus or of the blood of the buffalo suffering from the disease, we are in a position to infect not only the buffalo, but likewise cattle, horses, pigs, guinea-pigs, rabbits, white and grey mice, and pigeons. Dogs and sheep have great resistance to the disease. Fowls and ducks are immune. Experiments have shown that the most susceptible of the experimental animals is the rabbit, and that a mortal attack was induced by cutaneous, subcutaneous, peritoneal or pleural injection of the virus. By the digestive canals also it can be produced. Healthy rabbits kept in a room with sick buffaloes likewise took the disease.

By subcutaneous infection when the material was mixed with sterilised water (blood or flesh infusion culture) and injected, the temperature rose to 40—41.30° C., attaining its highest point generally in eight to eleven hours, never longer. In proportion to the virulence of the material the disease ran its course in from nine to fifteen hours.

Following infection through the digestive apparatus the disease runs a longer course, and the rabbit lives for twenty-four to thirty-two hours. If inoculated into the pectoral cavity death occurs in two to three days.

As we have before mentioned, rabbits brought into the same stable in which sick buffaloes are kept take the disease, and in such cases they die within twenty-four to forty-eight hours.

On *postmortem* examination a somewhat bloody transudation into the pleural and peritoneal cavities is found, and further the blood-vessels of the mesentery and the serous membranes are much injected. The parenchymatous organs are congested, the lungs gorged with blood, the perilaryngeal and peritracheal connective tissues œdematous. In the trachea and bronchi large quantities of frothy fluid serosity are found, and the mucous membrane appears red and studded with petechiæ. The spleen and lymphatic glands enlarged.

The mucous membranes of the bowel and stomach are injected, especially when the infection has taken place through the digestive system.

In cases of infection by the direct injection of the virus into the lung or pleural cavity we find sero-fibrinous exudation and necrotic inflammation of the lung. Cutaneous or subcutaneous infection does not remain localised.

In the blood and spleen of infected rabbits the bacteria of the disease were demonstrated in great numbers.

Guinea-pigs are more immune, and support the subcutaneous injection for two to three days.

In the larger animals the horse is destroyed in an average of twenty hours, horned cattle twenty to forty-eight hours, and pigs in twenty to twenty-four hours, by subcutaneous injection. Considerable infiltration always occurs at the seat of inoculation, and the course of the disease resembles that of septicæmia.

Effect of Virus on Dog and Sheep.—The dog and sheep support the virus given in the food or by experimental inoculation. Only in one case was a dog or a sheep destroyed by the injection of more than 1 c.c. of a virulent bouillon culture in a short time, from which it appears possible that the toxic products of the virus may be fatal to dogs and sheep when given in large quantity.

I have also used buffalo calves; these experiments prove that virulent agar culture rubbed into the unwounded skin will not cause the disease, and that it is not usually communicated when the skin is whole. When we wound the skin *Ghotwa* may be produced by the cultivated virus or the virulent blood by smearing the wound with it, and we can in this manner cause death in the buffalo in twenty-four to thirty-six hours.

With reference to infection *per os* I have made experiments to control my experiences; virulent culture mixed with milk in large quantity and food with virulent blood was given to buffaloes. There was some reaction, but the animals recovered. In order to ascertain whether the animal remained susceptible a subcutaneous inoculation with virulent material was made; there was no reaction: It appeared that the first reaction had rendered the animal immune.

HOW TO TREAT BONES.

The following information regarding farm methods of treating bones, where no crushing-mill is available, has been furnished, in reply to a query from one of our correspondents, by Mr. A. N. Pearson, Government Agricultural Chemist, Victoria:—

Bones in country districts, where crushing-mills are not available, may be reduced by means of caustic lye, quicklime, or freshly-calcined wood ashes.

A simple plan is to pack the bones layer by layer, with freshly calcined wood ashes, in a barrel, and keep the mixture moistened for some months. Casks may be kept in constant use for this purpose on a farm, receiving every few days a fresh layer of bones and of ashes.

A quicker method is to boil the bones in an iron or copper boiler together with strong caustic lye. The proportions of bones and lye to be used are not exact or invariable. Roughly speaking, five parts by weight of caustic soda, or seven parts by weight of caustic potash, dissolved in

15 parts by weight of water, should disintegrate about 15 parts by weight of bones by two or three hours' boiling.

If the bones be allowed to remain in the caustic liquor, even without boiling, they will, in the course of a week or so, become disintegrated.

Another method of softening bones is by mixing in heaps with quicklime and loam. A layer of loam 4-in. deep is made, and on this is placed a layer, about 6-in. deep of bones, and above this a layer 3-in. deep of quicklime. The layers of loam, bones, and lime are repeated in succession until the heap reaches a convenient height, when it is finally covered with a thick layer of earth. Holes are then bored in the heap from the top, and water poured down them to slake the lime. The mass will become hot, and remain so for two or three months, after which the bones will be friable, and the whole heap may be mixed up, and is ready for the ground.

BUTTER DIRECT FROM VEGETABLES.

Butter without the aid of a cow is what Willard G. Day, an inventor, of Baltimore, Md., promises. Electricity is the chief agent Mr. Day proposes to employ in the production of butter directly from the vegetables which form the food of cattle whose milk is used in the churn. Mr. Day first discovered that the peculiar characteristic traits of different varieties of butter, cheese, etc., were owing to general causes. One was the kind of food on which the cow was fed; the other was the kind of microbe nourished at and by the roots of the plant which furnished the food to the cow. Armed with these two secrets (says the *New York Herald*) Mr. Day began his work, which consisted in extracting and then assembling artificially the same products which are usually brought about by nature. He succeeded in producing from the vegetable kingdom oils which differed very slightly from those of the animal kingdom. Having got thus far, the next step was to change the vegetable oil by giving it

the same chemical constitution as that possessed by the animal article desired—in other words, to make the animal butter oil out of corn, grass, and similar vegetable substances. The secret in this part of the process Mr. Day found to consist in the fact that animal and vegetable carbohydrates strongly resemble each other. The differences which are found in oils are nearly all owing to the nitrogenous sheaths in which the globules of oil are contained. Thus to this sheath is due the tallowy smell of tallow, the mutton or smell of mutton, as well as all the rank odours of many vegetable oils. When oils are extracted by heat or the mechanical violence of pressure, the deleterious nitrogenous characteristics of the globule sheaths are imparted to the oil globules themselves, and no art can separate afterward. Here comes in the great discovery in the use of the electric light. Mr. Day found that when these oils and fats were subjected to the radiant energy of powerful electric light, the nitrogenous sheaths were shrivelled and their contents put in a condition to be milked out or extracted by a gentle pressure without being contaminated by the characteristics of the animal or plant itself. Another effect was also produced. Whatever microbe was associated with any particular oil or fat was killed by the actinic power of the light, thus leaving the article free from any of its native microbes and ready to be used as a culture medium for any desired microbe. Among the microbes destroyed by the light are those which cause putrefaction and decay, and so the articles acted on by the light are readily preserved as long as they are protected from new invasions of nature's hosts of destroyers. As a result, the various kinds of butter, cheese, etc., made under the Day processes show most remarkable keeping powers, far surpassing those produced by the old-fashioned methods. For the same reason the new articles are not affected by any diseases such as tuberculosis and typhoid fever, which may be carried and transmitted in the milk of cows, as well as by contamination from barnyard association.

Supplement.

THE ROYAL BOTANIC GARDENS, CEYLON.

EXTRACTS FROM THE REPORT OF THE DIRECTOR FOR 1897.

3.—THE WORK OF THE GARDENS.

(1) *Introduction of new and important Economic Plants ; Experiments in Cultivation, &c.*—

A fair amount of ground has been laid out during the year in experimental plots of economic plants, chiefly at Peradeniya (see below). The labour required for this work has been provided partly by discontinuing the sale of common pot plants for verandahs, partly by neglecting the ordinary work of the gardens, such as weeding, &c. An increased vote for labour has, I am glad to report, been sanctioned for 1898, the increase amounting to Rs. 1,150. The whole of this labour will be devoted to experimental work. Money has also been voted to provide the salary of an efficient native officer to supervise this work, under the immediate direction of the European officers.

(2) *Other Work.*—The completion of the late Director's "Flora of Ceylon" has been undertaken by Sir Joseph Hooker.

A large amount of time and labour has been expended in the study of the cacao disease (see below), and various diseases of tea, cocoanuts, betel, nutmegs, and other plants have also been studied by the Director and the Honorary Entomologist.

Much work has been done in the laboratory and in the open by students and others from abroad (see below).

A good deal of travelling has been done during the year by the staff of the Department. The Director was absent from Peradeniya 115 days, including 50 days spent in visiting the branch gardens (chiefly in attending to the rubber experiments at Henaratgoda), 26 days spent in collecting and the study of local agriculture, and 20 days spent in investigating the cacao disease.

An attempt has been made to bring the Department more into touch with the public by issuing periodical circulars dealing with horticultural, agricultural, and botanical subjects. These will be continued during 1898. Each circular deals with one subject only. Three were published during the latter half of 1897, one being introductory, the others dealing with the cacao disease. Copies are sent free to all Government officers, to Planters' Associations and similar bodies, and to Botanic Gardens and similar institutions abroad. Residents in Ceylon can obtain these circulars free at the various gardens, or by post on prepayment of postage; to persons residing abroad a small sum is charged.

(3) *Sale of Plants to the Public.*—Permission was granted in May to discontinue the sale of common pot plants for verandahs, and this branch of work has been gradually given up as the stock of plants in hand was cleared off. This change has caused some dissatisfaction, and complaints are often made that such plants cannot be obtained from local nursery men. The matter is receiving attention. The prices at which such plants have hitherto been sold at the gardens are very low and do not nearly repay the cost of the labour expended. Many persons have been in the habit of buying plants in the gardens and immediately re-selling them to the public at a considerably higher price. If it be found necessary to resume the sale of these plants, the price should be considerably increased. It should not, however, be necessary, in the present condition of the Colony, for the gardens at Peradeniya, Hakgala, and Henaratgoda to do such work as this. (The gardens at Badulla and Anuradhapura continue for the present to sell common pot plants.) The sale of valuable economic plants and of such ornamental plants as cannot easily be obtained from local sources is of course one of the chief duties of the Department. With a view to making this more generally known advertisements are periodically inserted in the local papers, and during 1898 price lists will be published of the various kinds of plants and seeds that may be purchased in the gardens.

4.—PERADENIYA GARDEN.

From the report of the Curator I make the following extracts:—

Cultivation.—The borders of shrubs and other flowering plants flanking the central drive have been much improved by judicious attention to pruning, forking, and manuring. Advantage was taken of the wet weather in November and December to lift and re-plant the bulbs growing at the edges of the borders, which had become much crowded and had exhausted the soil. The semi-circular bed at the middle of the drive (No. 9 on the map), formerly occupied by a large euphorbia surrounded by overgrown erotons, was cleared, partly turfed, and neatly laid out with beds of the best cannas.

A number of succulent and other plants have been planted out on the rocky bank of the road below the Gardner memorial. A collection of Codiaeums (erotons) has been planted along both sides of the walk leading to the octagon conservatory.

The herbaceous ground has had special attention bestowed upon it. The beds were all forked and manured; many of the commonest and tallest shrubs were cleared out and replaced by more suitable species.

The following species flowered here for the first time in 1897, viz., *Caraiya guianensis*, *Cassipourea* sp., *Dracaena Godseffiana*, *Gardenia* sp., *Geonoma acaulis*, *Grevillea Barclayana*, *Lonchocarpus* sp. (the Trinidad species used here as shade for young cacao), *Loureira cochinchinensis*, *Pachira* sp., *Pinanga Kuhlii*, *Strophanthus hispidus*, *Tacca laevis*, *Zanthoxylon capensis*. The cannon-ball tree (*Couroupita guianensis*) ripened a full-sized fruit here in 1897 for the first time.

Experimental Plots.—The plot of vanilla at the end of the nursery has been renovated and a number of fresh vines have been planted.

The land on the west side of the avenue of Oreodoxa palms (section H on the map) has been partly cleared and laid out in experimental plots, as well as part of the land between the palm avenue and the river. Small plots have been planted out with cardamoms, Para rubber, rhea in its two forms (*Boehmeria nivea* and *B. tenacissima*), coca, Tous les mois (*Conna edulis*, a useful vegetable), various species of bow-string hemp (*Sansevieria*), *Calathea Allouia* (edible tubers), and *Carludovica palmata* (see report for 1896, p. 12). With the increased labour, skilled and unskilled, that will be available next year a considerable extension of these experimental plots will be made.

Visitors.—The book kept at the lodge was signed by 2,390 persons not resident in Ceylon, as against 2,520 in 1896. The number of local visitors was about 13,600. The King of Siam, with his suite, visited the gardens on April 22.

5.—HARGALA GARDEN.

The following extracts from the report of the Superintendent show the work which has been done during the year :—

Fernery.—The destruction of the plants by sambur deer was greater than ever in the early part of the year. I am glad to report, however, that a special vote was granted for a barbed wire fence round this part of the garden. The fence was put up as quickly as possible, and the usual damage, which has hitherto occurred at the latter end of every year, has thus been avoided.

Little has been done in the fernery beyond the usual upkeep of the plants. The roots of the jungle trees are beginning to tell seriously on the ferns, &c., and all the plants require to be lifted and the beds re-made. Five beds at the lower end of the fernery have thus been treated; the encroaching roots have been removed, new soil added, and the beds re-planted.

A new border, 100 ft. long and 3 ft. wide, has been made on the north side of the path at the lower entrance, and planted with ferns, begonias, &c.

Begonias, *Primula obconica*, and balsams have flowered well this year.

Nurseries and Plant Sheds.—The propagation and upkeep of stock has been carried on as usual. The oak plants mentioned in last year's report have done well, and we have now about 3,000 good plants ready for distribution. 12 lb. of oak seeds were received from Kew in December and at once sown. 7 lb. of camphor seed were received in April from Yokohama, but the consignment proved a failure.

Violets will not do well in this climate without shelter from heavy rain and strong sun, so a thatched shed, 63 ft. long and 4 ft. wide, with open sides, has been erected in the nursery for their protection. Under this the white and blue Neapolitan violets have done remarkably well, producing an abundance of large, well-formed, sweet-scented flowers, some of them 1½ in. across.

The wattle fences round the lower nursery were blown down in July, and part of the wall of the upper nursery collapsed during the heavy rain in August. Both were at once repaired. The upkeep of wattle fences, which require constant repair, is a great waste of labour, and a permanent and effective fence of wire and wire netting should be provided.

A temporary plant shed, 60 ft. long, was erected in November and thatched with talipot to protect the seedling annuals. The six thatched plant sheds have been repaired, but are now very dilapidated and require entire renewal.

5,037 wooden labels were made during the year, also 3 plant tubs and 90 plant boxes.

85 plums and 27 apples were grafted at the end of the year, and most of them have taken well.

675 packets of seeds were sown in pots and boxes, 73,388 seedlings were pricked out or transplanted during the year, 46,472 cuttings were planted in the nursery and propagating houses, and 6,530 plants were potted. The raising of such large quantities of stock is rendered necessary by the great loss from black grub and bad weather.

Borders and Shrubberies: Improvements, &c.—90,115 plants and seedlings of ornamental trees, shrubs, garden plants, and annuals have been planted during the year in the supply and upkeep of the gardens. All the borders were maintained in good order, and a new border was made to the east of No. 1 summer arbour. The pruning, thinning out, and digging out of the shrubberies was attended to, and manure applied. A hedge of *Frenela rhomboidea* has been planted along the public road below No. 3 summer arbour. Vacant places in the shrubberies have been filled in with suitable plants.

The greatest improvement during the year has been the erection of a barbed wire fence protecting the fernery and the part of the garden lying between it and the entrance gate. The wire was purchased locally and fastened to wooden posts. The total cost was only Rs. 281. It is much to be desired that the whole garden should be fenced in like manner, a portion being done every year. The length of fence erected this year is 400 yards; the fence is 5 ft. 6 in. high, with five rows of wire. 200 yards of 2-in. mesh galvanized wire netting, 3 ft. wide, has been fixed against it, beginning from the entrance gate, to keep out small animals. The undergrowth on the land between the fence and the cultivated garden, averaging 35 yards wide, has been cut out and all the rubbish burnt off. A path has been traced from the north corner of the fernery, winding through this new clearing, and joining the main drive near the gate, and two branch paths have also been traced from it to the main drive. The length of these paths is 380 yards, of which 130 yards have been partly made. A flight of ten steps has been laid at the end of the first branch path leading into the drive at the end of the pond. At the top end of the gully to the north of this retaining walls, 8 ft. long and 5 ft. high, have been built on each side of the stream, and a small ornamental wooden bridge has been made over it. Retaining walls have been built on each side of the gully to a length of 130 ft. A culvert was laid in the gully to the south, at the point where the path passes over it.

Classified Herbaceous Garden.—This has been a very trying year for herbaceous plants, owing to the excessive wet weather in the latter part of the south-west monsoon. Much damage was done by hares and other animals. The ground on the south-eastern side was cleared and dug, and six new beds, similar to those already existing, were made in it and partly planted with different kinds of grasses.

Rose Garden.—A new lot of roses, received from Messrs. Smith & Co., were planted in January and pruned down closely at the beginning of February. They then grew fast and flowered freely in April and May, but suffered severely from the abnormal weather later in the year. A protecting fence of wire netting is much needed for this garden and the adjacent herbaceous garden.

The Oxalis Pest.—This has been much reduced in some parts of the garden, but continues to appear in new places. 85½ bushels of tubers and leaves were weeded out during the year, and on one day in October the whole staff of coolies was set to work and weeded out no less than 108 lb. of tubers.

6.—HENARATGODA GARDEN.

The vote for upkeep of this garden was increased this year to Rs. 3,000, and a special vote for wire fencing was granted. The general condition of the garden has consequently been much improved.

Roads.—The roads and paths have been kept in good order. About 130 yards of road from the nursery have been raised, widened, and gravelled. Four culverts have been built. The bridge at the entrance to the garden is in urgent need of repair.

Wire Fence.—About 2,000 yards of wire fencing were put up along those boundaries of the garden which are not protected by the river. The fence was supplied by Messrs. Palmer & Co. of Westminster. Iron posts are fixed at every 18 yards, supporting four strands of stout barbed wire, strengthened by steel droppers between the posts. The erection of this fence is a very great improvement to the garden, and plots of important and valuable plants can now be laid out without fear of their being damaged or destroyed by cattle straying into the garden as was frequently the case before.

Buildings.—The conductor's bungalow was repaired, whitewashed, and painted. The roof of the conservatory, which had become rotten, was rebuilt with new timber. The visitors' shed was patched up temporarily towards the end of the year, and materials were obtained for the purpose of rebuilding it during 1898 in a more substantial way.

Upkeep of Garden.—The lawns, borders, &c., have been kept in order, and a considerable quantity of manure has been used in improving the condition of the various cultivated plants in the garden. A cart and a pair of bulls have been purchased and have proved of much use.

Experimental Cultivations.—A good deal of time and labour has been expended on the cultivation of economic plants. The experiments on rubber, begun last year, have been continued. Over 200 tappings have been made on 34 trees of the younger plantation of Para rubber. The plantation of vanilla has done well, and a considerable number of cuttings have been sold. The land formerly occupied by tea and part of that occupied by Liberian coffee has been cleared. New experimental plantations of rhea fibre, pineapples, coca, cardamoms, *Payena Leerii* (guttapercha), *Sansevieria* (bow-string hemp), gambier, and *Polygala butyracea* (a new fodder plant), have been laid out, and are doing fairly well.

Visitors.—The number of visitors during the year was much the largest on record, being 323 as against 106 in 1896.

7.—ANURADHAPURA GARDEN.

The vote for upkeep of this garden was this year increased from Rs. 1,200 to Rs. 2,000, and the general condition of the garden has been very much improved in consequence. A special vote was sanctioned for the erection of a wire fence.

Buildings.—The cooly liues, which had become utterly ruinous, were put into a fair state of repair, but really require to be entirely rebuilt. The much-needed repairs to the conductor's bungalow were commenced towards the end of the year.

Wire Fence.—About 1,250 yards of wire fencing were put up along the sides of the garden which are not protected by the elas. The fence is exactly similar to that at Henaratgoda.

General Upkeep.—The number of coolies employed in the garden has been increased, and a sum of money set apart for the purchase of manure. The general condition of the plants in the garden is now fairly satisfactory. A number of the palm trees have been much injured or destroyed by beetles, which bore into the buds. Trial has been made, but without much success, of kerosine emulsion as a preventative. Among the palms thus injured is unfortunately included the doum palm, which was just beginning to branch.

The weeding, clearing, and manuring of the garden has been attended to. A number of wira trees have been cut down, affording more room for the more valuable trees planted amongst them. The end of the garden near the Tissawewa has been drained and planted with various fruit and rubber trees.

The Government Agent has kindly provided a few seats for the garden, which are much appreciated.

The trees or plants of camphor, cacao, mahogany, *Swietenia macrophylla*, teak, baobab, dividivi, guaiacum, *Cedrela odorata*, *Eucalyptus alba*, coca, cinnamon; Nagpur oranges, and others are doing very well.

8.—BADULLA GARDEN.

The vote for upkeep of this garden was increased for 1897 from Rs. 1,500 to Rs. 2,000. This has provided for an increased labour force, and the general condition of the garden has been much improved.

Water Supply.—Much difficulty has been experienced in obtaining a proper water supply for the garden from the ela which supplies the paddy fields above. Arrangements were made with the authorities in charge of the ela to obtain a supply during a fixed period each day.

General Upkeep.—During the first eight months of the year the time of the coolies was largely taken up in carrying water from the river for the use of the garden, and thus the general garden work suffered considerably. The garden has been kept tidy, the shrubs carefully pruned, and a number of duplicate trees cut out. The plant shed was thoroughly repaired, and both it and the nursery kept supplied with a good stock of plants.

Weather.—The first nine months of the year were very dry, but there was plenty of rain in the latter part of the year.

11.—NOTES ON ECONOMIC AND OTHER PLANTS.

Tea.—The total export is again the largest on record, exceeding 116 million pounds, an increase of 8 millions over 1896. Exchange has continued high and prices rather low (7·71*d.* against 8·21*d.* in 1896).

The immense area now covered with tea still remains singularly free from disease, but great care and attention must be exercised if this condition of things is to last. When an outbreak of any disease apparently due to insects or fungi is noticed, the affected plants should be at once destroyed by fire to prevent, if possible, any further spread of the disease. One or two cases have occurred during the year of outbreaks of disease among nurseries of young plants grown from Indian seed. Planters should pay special attention to their nurseries in this respect, as considerable risk is run of importing dangerous or troublesome diseases with foreign seed.

Coffee.—The exports of coffee barely exceeded 19,000 cwt., over 3,000 less than last year.

The planting of Liberian coffee has received a severe check by the very great fall in price which has occurred during the year.

Cacao.—The exports continue to increase steadily, being 34,503 cwt., as against 31,366 in 1896.

Much attention has been given during the year to the canker mentioned in last year's report. During the early part of the year an extended investigation of the diseased areas was made by the staff of this Department, and the disease was found to be common in nearly all parts of the Central and Uva Provinces. The disease was found to be due to the attack of a fungus, whose exact nature is at present unknown, but which almost certainly belongs to the class of fungi which cause the various cankers of stems and roots. The information collected was published in two of the circulars issued by this Department, in which also suggestions were made as to the treatment of diseased areas or plants and the prevention of further spread. It was suggested early in the year that a specialist in fungus diseases should be engaged by Government for the study of this disease. This proposal, being adversely reported upon, ultimately fell through. There is much misconception as

to the capabilities of a specialist. His speciality is simply to discover the exact nature and life history of the fungus causing the disease. Many persons seem to think that once this is done he will be able to propose some simple wash or other treatment which will at once stamp out the disease where it already exists and prevent its re-appearance or its appearance in new places. This is far from being the case. The treatment of a fungous disease must generally be by improved cultivation, destruction of diseased plants, disinfection of the soil and surroundings, and preventive measures generally, but to cure plants already diseased is usually almost impossible. Whatever may be discovered about the life history of the fungus, the treatment of the disease will be much the same. Had the disease been dealt with when it first appeared many years ago it would not now be so widespread. There seems now but little chance of freeing the old red varieties from it in most districts of the Central and Uva Provinces. The Forastero varieties seem much more capable of resisting the disease; the planting of these varieties is extending, and it seems likely that they will gradually replace the old red cacao to a very large extent.

Cocoanuts.—The export of oil shows an increase of 66,000 cwt.; that of copra has more than doubled (106,601 cwt. against 50,049 cwt. in 1896); that of desiccated cocoanut has increased from 10,603,598 cwt. in 1896 to 12,054,452 cwt.; that of coir has largely increased, and also that of poonac. The only export that shows a decrease is that of nuts, and this decrease is very small. The industry appears to be in a prosperous condition, but, like tea, the increase is becoming gradually less pronounced.

Rubber.—The interest taken in the cultivation of Para rubber has received a very great impetus during the year, and the demand for seed has been enormously larger than the supply. These gardens form practically the only source of seed from mature trees. The total crop this year was rather over 100,000 seeds, of which 88,500 were sold to planters in Ceylon.

As mentioned in last year's report, experiments in tapping the trees at Henaratgoda have been carried on throughout the year. The results so far obtained are of some interest, and will shortly be published in one of the circulars issued by this Department.

Carludovica palmata.—A small experimental plot of this plant (see last year's report) has been made at Peradeniya and a supply will shortly be available for distribution to persons who may wish to experiment with it.

Rhea.—Considerable attention has been drawn to rhea during the year, and several planters have experimented with its cultivation on a small scale. Plots of the two chief varieties have been laid out at Peradeniya and the other gardens, and have grown well. Unfortunately the plants at Peradeniya have on several occasions been partly eaten down by cattle straying into the gardens during the night, owing to the want of a satisfactory fence, and it has thus been impossible to test the quality of the fibre.

There seems a prospect of rhea becoming an important cultivation in Ceylon in those parts where there is an ample rainfall at all times of the year and a plentiful supply of manure, the heavy crops rapidly exhausting the soil.

Camphor.—Mr. Nock reports:—

The plants have continued to grow well at Hakgala, and some of them are now 9 ft. high. They require pruning, and any one desiring to experiment in the distillation of camphor from twigs and leaves can be supplied with a small quantity of material for the purpose. We have had very good accounts of the plants distributed in 1895; some of those in Galle District have already grown to a height of 12 ft. There have been numerous inquiries for plants during the year.

Vanilla.—The comparatively high price of vanilla has given a stimulus to its cultivation in Ceylon, and a considerable number of plants have been put out during the year.

Ipecacuanha.—The nurseries at Henaratgoda now contain about 2,000 young plants, most of which are available for distribution to those wishing to experiment with this new product.

Vegetables.—The vegetable gardens have been considerably extended during the year, especially by the planting of as many varieties of native vegetables as possible.

Fodder Plants.—The lucerne at Hakgala continues to do well. If grown as a garden plant and supplied with dressings of lime and manure it continues to give good and frequent crops for many years. Four small beds were sown in March, and gave three good crops before the end of the year.

The new fodder plant, *Desmodium tortuosum*, the Florida beggar-weed, has grown fairly well at all the gardens.

Fruit Trees at Hakgala.—Mr. Nock reports:—

A good many of the imported fruit trees have died during the year, some after the excessive rains at the end 1896, and others after those in August, 1897. We have a good hatch of strong plants of Cherimoyer, and it is surprising that there is not more call for them for planting between 3,000 and 5,000 ft. The red guava, *Psidium Cattleianum*, ripens in this district during August and September. It is a beautiful little fruit, and deserves to be cultivated much more extensively than it is. There is no doubt that by cultivation and selection it could be greatly improved in size and flavour. The apple-shaped guava, *Psidium pomiferum*, ripened a good crop in October and November, the flavour and size being good. Several fruits measured $8\frac{1}{2}$ in. in circumference. The fruit, however, is comparatively light, the weight being only $4\frac{1}{2}$ to 5 ounces. Birds are very fond of the fruit, and protection must be afforded as soon as it begins to ripen. The English blackberries began to fruit in May and really bore well; one spray had on it at the beginning of May no less than 107 berries and flowers in all stages. Given good soil and cultivation, I see no reason why this useful fruit should not do well in all up-country gardens. Apple trees suffer much from canker. As many as 45 fruits set upon one tree, but I regret to say most of them were stolen. Strawberries continued to grow and fruit well, but the weather during most part of the year has been far too wet for them to ripen properly. They require to be protected from birds, and also regularly mulched with clean straw and the fruit kept well off the ground. A quantity of plants were set out in February among the trees in the camphor plantation, but they have nearly all been destroyed by the Sambur deer.

Ornamental Plants.—The handsome West African climber, *Camoensia maxima*, flowered freely at Peradeniya this year, and we shall probably have plants for distribution during 1898. The *Victoria regia* plant was killed by the windy weather of the south-west monsoon.

At Hakgala *Wistaria chinensis* flowered well in February and March and again in December. Hydrangeas, dahlias, and camellias also did very well.

Peradeniya, January 22, 1898.

JOHN C. WILLIS, Director.

WILSON, SMITHETT & CO.'S TEA REPORT FOR 1897.

WILSON, SMITHETT & CO.'S CEYLON TEA MEMORANDA FOR 1907

LONDON, FEBRUARY, 1898.

THE RETROSPECT OF THE CEYLON TEA MARKET DURING 1897. With a view to the occurrence of a certain amount of disappointment to planters and others connected with the industry.

Table of Tea Production and Exports. Columns include Year, Consumption (Home, Foreign, Total), To U.S.A., To Europe, To U.S.A. of America. Lists various tea types like Ceylon, Assam, and others.

Table of Tea Prices. Columns include Name of Tea, Price per lb. Lists numerous tea grades and their market prices.

Table of Tea Auctions. Columns include Name of Auctioneer, Price per lb. Lists various tea auctions and their results.

Table of Tea Auctions (continued). Lists more tea auction details and prices.

ESTIMATED RELATIVE YIELD AND AVERAGE PRICE.

Table showing estimated relative yield and average price for various tea categories like Nuwara Eliya, Dambulla, etc.

WEEKLY PUBLIC AUCTIONS OF CEYLON TEA DURING 1897 WITH AVERAGE PRICE.

Table showing weekly public auctions of Ceylon tea during 1897, including week ending, name of auctioneer, and average price.

BOARD OF TRADE RETURNS.

Table showing imports of tea during the past four years (1894-1897) and home consumption.

Home Consumption of Indian and Ceylon Tea.

Table showing home consumption of Indian and Ceylon tea compared with that of other countries.

MONTHLY AVERAGES OBTAINED IN LONDON FOR TEAS FROM DIFFERENT DISTRICTS IN CEYLON DURING 1897.

LITERARY REGISTER SUPPLEMENT.

[Under this heading, in future, we mean to give a four page "Supplement" with our *Tropical Agriculturist*, each month, when there is matter of sufficient value, so to be preserved.]

APRIL, 1898.

The Archæological Survey of Ceylon and its Work.

BY PROF. W. W. GEIGER.

Amongst the many objects that occupied the Eleventh International Congress of Orientalists held at Paris, it had the opportunity of noticing also the admirable work done by the Archæological Survey of Ceylon. According to a proposal which I made in the afternoon meeting of the Indian Section on September 10th the Congress accepted a resolution to express its warmest thanks to the British Government in Colombo for the varied and efficient assistance afforded to the historical inquiry about the island by publishing the Archæological Reports, as well as by editing the Mahavamsa and similar documents. The Congress hoped also that the work which has been undertaken so auspiciously, will be continued by the Government, and carried out in the same manner. Now I beg to add a few remarks to that resolution, which may explain its origin and its purpose. These remarks are only caused by the anxious desire to make the work of the Archæological Survey of Ceylon as useful as possible to the scientific world, and they are based upon the experiences which I myself had in making use of its publications for my own historical and linguistic studies.

First of all, I am sorry to observe that the Reports of the Archæological Survey of Ceylon are by no means so well known in Europe, and so much studied by European scholars, as we should expect and as they deserve. I beg to mention but one instance. In the year 1892 the Government published Mr. H. C. P. Bell's most interesting and comprehensive "Report on the Kegalla District of the Sabaragamuwa Province." But I am sorry I could not even find this work quoted in the German Oriental Bibliography, though the editors of this journal took the utmost trouble to make their list of books as complete as possible, and though they mention a good many papers of much less scientific importance. I know very well that in the winter 1895-6, when I was myself in Ceylon, the excavations of Sigiriya, undertaken by the indefatigable Archæological Commissioner, Mr. Bell, had led to very important results, and I suppose that in the meantime some detailed report has been printed on these operations. But I have not seen it up to the present day, though I am very anxious to hear more about the subject.*

All scholars, I think, will therefore agree with me that it is extremely desirable to give much more publicity to the printed reports of the Ceylon Govern-

ment than they seem to have at present. This can be done by various means. But first of all it will be necessary that the Ceylon Government should give orders for the regular dispatch of the Archæological reports to this Society and to the British Museum, and it might also officially entrust a certain number of booksellers in the different countries of Europe with the sale of its publications. I suppose, of course, that an arrangement of that kind has already been made for England; but as regards Germany, Mr. Otto Harrassowitz, at Leipzig, no doubt would come first into consideration, because he already has in his hands nearly the whole book trade between our country and the Oriental publishers. Besides, if I am allowed to judge from the most amiable reception and liberal assistance which I ever found in Ceylon, I may, perhaps, add the suggestion that as is done by the Indian Government with their publications, the publications might also be sent direct to such scholars as are especially engaged in Sinhalese studies.

I pass now to the form and the contents of the publications themselves, and I wish at first to draw particular attention to the epigraphical work done in Ceylon. Inscriptions which have been newly discovered, or which now can be explained in a more satisfactory manner than formerly, are at present generally published in the Reports of the Archæological Survey, together with the other materials. The third part, for instance, of the Report on the Kegalla District, which I mentioned above, is merely an epigraphical one, and it contains, amongst other documents, the important inscription of Dewanagala, which alludes to some historical events in the reign of Parakrama Babu I, quite in accordance with the statement of the Mahavamsa. Other new inscriptions used to be edited and translated in the J.R.A.S. Ceylon Branch; not to speak of Rhys Davids' papers on old Sinhalese Inscriptions, formerly published in J.R.A.S. in England, and of Rhys Davids', G. Goldschmidt's, and Edw. Müller's articles printed in the *Indian Antiquary*. This arrangement, I think, is not a happy one. The materials are spread far and wide, and the continuity of inquiry is in danger of being lost. According to my opinion, it would be best to separate the epigraphical part totally from the purely archaeological work, and to publish the inscriptions and whatever belongs to their study in particular reports. Thus a kind of "Epigraphia Ceylonica" would be established, and I am sure that it would find the unanimous approval of all European students of Sinhalese and of Indian epigraphy. It is hardly necessary to add that not only the newly discovered inscriptions or those which will be discovered in future, should be published in these periodical reports for which I beg to suggest the title "Epigraphia Ceylonica." There are a good many inscriptions already printed and translated as for instance in Edw. Müller's "Ancient Inscriptions of Ceylon," which require a new study, and which can be edited now with many improvements both in the text and in the translation. I do not doubt that even

* I know only Mr. Bell's "Interim Report on the Operations of the Archæological Survey at Sigiriya in 1895," printed in the J.R.A.S., Ceylon Branch, No. 46 S. 44-56.

those scholars who made the first steps in that rather dark field will fully agree with me on this point. The "Epigraphia Ceylonica" must, therefore, be accessible to everybody who might be able to contribute to the elucidation of Sinhalese inscriptions in the West as well as in the East. For by common labour only, and particularly by the common labour of European and of Oriental scholars, can satisfactory results be attained.

But there is still one important point which cannot be passed over in silence. It is quite indispensable that each inscription to be published or newly explained in the "Epigraphia" should be reproduced in a good facsimile. Mere transliterations are of comparatively small value, and would be sufficient only in quite exceptional cases. We cannot accept statements without having the opportunity of controlling them, for even the most trustworthy and most careful scholar may make a mistake in reading Sinhalese inscriptions, and a misreading may lead him to conclusions which are totally wrong.

The edition of the "Epigraphia Ceylonica" must, of course, be entrusted to a man who combines practical knowledge with scientific method; and I am sure that the Ceylon Government has at its disposal more than one scholar who possesses those qualities. But I hope that nobody will find in this remark anything like a reproach against the present editor of the Archæological Reports. We are all so much obliged to him for the invaluable service he has rendered to the science, even risking his health and his life, that any reproach would be equal to ingratitude. My suggestions touch only the form of the publications of the Archæological Survey; and I should be glad if they would be approved by Mr. Bell himself. For the edition and translation of inscriptions discovered by him, Mr. Bell always made use of the assistance of some native scholars, and he has repeatedly mentioned this useful service with the warmest acknowledgement, although it unfortunately does not appear in each case who is responsible for the particular piece of work.

The epigraphical inquiry, however, must be supplemented, I think, by a systematic study of the literary sources of the Sinhalese history. The chief part has already been done in this respect by the edition and translation of the Mahavamsa, which we really may call a standard work. But I believe that it is now time to publish also the secondary sources in their original text, together with an English translation, as for instance the Pujavaliya, Attanagalamvamsaya, Rajaratnakaraya, Rajavaliya, etc. I am fully aware that some of these books have already been edited in Ceylon itself. But it is sometimes not very easy to get these editions; the Rajavaliya is not yet printed at all. Besides, I think that a translation of these works is hardly superfluous, because many scholars will make use of them as historical sources, who are not able to read Sinhalese books in the original language. As to the form of these publications, I would propose to print them, just like the inscriptions, periodically in separate parts, but with one general title, as "Monumenta Historiæ Ceylonicæ"; these "Monumenta" would include even interesting passages about Ceylon and its people, taken from Greek and Latin, Arabic and Chinese, and even from older Portuguese and Dutch authors, together with a historical and geographical commentary. Papers of that kind used to appear sometimes in the J.R.A.S., Ceylon Branch; but I think it better to reserve the Journal for what we call scientific inquiries. Even such a treatise as Appendix I (Constitution of the Kandyan Kingdom) in Bell's Report, already quoted, would be in the right place in the "Monumenta," and would be studied by many more scholars, no doubt, than can now be the case. In fact, I hope it will be possible, in the course of time, to collect in the "Monumenta," all the materials on which our knowledge of Sinhalese history is based.

I took the liberty to express a few wishes, felt, I suppose, by all the European scholars who are engaged in Sinhalese studies, regarding the publications

the Archæological Survey of Ceylon. My purpose was only to make its excellent works more fruitful and more accessible to the scientific world. Nobody will say, I hope, that my suggestions are merely utopian ideas which never can be realized, because the expenses required by them would be extraordinary. They chiefly touch, as I have already said, the outer form of the publications. I wish to separate on one side those materials which are somewhat different, and on the other, I wish to concentrate the divergent labours of such scholars as are really working in the same field. The "Monumenta" would of course, appear as sufficient material was collected and Government funds were available for the publication, and the same would be the case with the "Epigraphia." I admit that some more money would be required by the proposal to add good plates to each of the inscriptions published therein. But it would be sufficient to publish the work quite slowly, provided it is published in a perfect and entirely satisfactory manner. I believe also that it will be necessary to print a greater number of copies of each report than has been done till now. But I am sure that at least a part of the money spent thereon will be recouped by the greater publicity, and by the better sale of the publications in Europe, according to the arrangement which I propose above.

To summarise, finally, all I have said, I beg to suggest quite respectfully that the Government of Ceylon might resolve to separate the Reports of the Archæological Survey into three different publications:

- (1) *Archæological Reports*, containing the archæological and sculptural results of the excavations;
- (2) *Epigraphia Ceylonica*, containing the newly discovered inscriptions, or new interpretations of such inscriptions as are already known;
- (3) *Monumenta Historiæ Ceylonicæ*, a kind of "Quellenkunde," containing Sinhalese historical books and other literary sources belonging to the history of Ceylon in the original text, with translation and commentary.—*Royal Asiatic Society's Journal*.

"Sigiriya Frescoes."

TO THE EDITOR ["CEYLON STANDARD."]

SIR,—Some one has been good enough to send me copy of your issue of the 20th instant, containing a letter by Mr. C. M. Fernando, and a short editorial paragraph, relating to the "Sigiriya Frescoes."

I note that Mr. Fernando has returned to the charge, in defence of his theory of Sinhalese authorship for the paintings at Sigiriya.

I do not propose to enter here fully into the disputed question of their execution by native, or foreign, artists: this I hope to do later in my Archæological Report on Sigiriya. I desire now merely to correct one or two inaccuracies into which Mr. Fernando has slipped.

It may be assumed once for all that the frescoes at Ajanta in India, and those on the Sigiriya Rock, were executed, if not by the same hands, at least by artists trained in the same school.

Mr. Fernando's arguments against the importation of "exotic talent" for the painting the Sigiriya frescoes may best be quoted, and briefly touched on *seriatim*:—

(I) "*Cæteris paribus*, the credit of painting frescoes found in Ceylon must, *prima facie*, rest with the Sinhalese."

Admitted; but "other things are" *not* "equal"; little Ceylon is not giant India; the field of selection for competent artists is as 1 to 60 (25,000 square miles to one-and-half millions.)

II. "Two of the frescoes at Ajanta, as pointed out by Ferguson and Manning, depict scenes from the Mahawamsa, the ancient chronicle of Lanka."

The scenes referred to are—(a), the supposed landing of Vijaya in Ceylon; and (b) the, supposed introduction of Buddhism into the Island—given by Mrs. Speir in her "Life in Ancient India."

As regards (a), Mrs. Speir rightly remarks that the picture—from the horse worship introduced into it—illustrates “a northern adaptation of the story in the Mahawansa, related in a Nepalese work of Avalokiteswara” who saved “Sinhala” (Vijaya) in the form of a horse. The Sinhalese have always belonged to the *Hinayana* (“Lesser Vehicle”) school of Buddhism which knows not Avalokiteswara, the Bodhisatva of the northern *Mahayana*, or “Greater Vehicle.” Much the same comment applies to (b), it may equally as well have been based on Northern Buddhist works as taken from the “Mahawansa” of the Southern school—if the painting has anything whatever to do with the meeting between Mahinda and king Devanampiyatissa.

III. “Mr. Bell made a point of the fact that the Sigiriya frescoes were the only ones of the kind in Ceylon. I replied by saying that those of Ajanta were just as unique as regards India.”

The Ajanta paintings are not “unique” in the sense of the frescoes at Sigiriya. It is true that the former (as Fergusson records) “represent Buddhist legends on a scale and with a distinctness found nowhere else in India.” But there are other frescoes which in heauty of execution run them very close—if, indeed, they do not surpass them;—and which prove, further, that the art retained its full vigour for many centuries longer on the Indian continent. I refer to the wonderful paintings to be seen at Fathpur-Sikri, near Agra, the “royal abode” of Akbar in the 16th century. Here, in Ceylon, we have nowhere else mural painting attaining the standard of art exhibited in the Sigiriya frescoes.

Again, had Kasyapa employed Sinhalese *siyyaru* to adorn the walls of his marvellous citadel, it may reasonably be inferred that the services of the ancestors of the Nilagama guild of painters would have been enlisted; and yet at this day no tradition even lingers among these hereditary craftsmasters, whose work at the ancient Dambulla cave temple goes back to an earlier date than the occupation of Sigiriya as a capital. Shown the Sigiriya frescoes in the “pockets” themselves last year, these Nilagama men declared their inability to explain the process by which the colours have been permanently “fixed,” or to attempt to “restore” them in any degree.

(IV.) “Thus, from Mr. Bell’s own standpoint, there is nothing to prevent the supposition that these are the only existing frescoes of many that were painted, not only at Sigiriya but in other places as well, in the 5th century of the Christian era.”

Nothing at all, as far as Sigiriya is concerned—but a great deal as regards “other places” throughout Ceylon. If I have examined one ancient cave, vihare, &c., in the Central, North-Western and North-Central Provinces, I have examined well nigh a thousand,—and any painting rivalling the art displayed in the Sigiriya frescoes I have still to find. The surface painting faintly traceable on the “altars” of some of the larger Dagabas of Anuradhapura, on the walls of the so-called “Demala mahaseya” at Polonnaruwa, or in the caves of Handagala and Dimbulagala, is not devoid of merit, but belongs to a lower grade of art than the frescoes of Ajanta and Sigiriya.

(V.) Mr. Fernando harps on the allusion in the “Mahawansa” to the use of “vermillion paint mixed with tala oil” for the ornamentation of Ruwanveli Dagaba when built by King Dutugemunu (first century B. C.); and quotes Sir Emerson Tennent in support of the “claim the discovery of oil painting on behalf of the Sinhalese,” upon this single shred of not too reliable evidence.

Very good: let us admit for the moment that the honour of the discovery actually rests with the Sinhalese—though it really needs considerably more proof;—let us go further, and assume that Dutugemunu did not go to the continent of India for his artists—as, for all the “Mahawansa” tells us, he well may—what then? He must be a bold man that would assert that the descendants of the Sinhalese (if Sinhalese they were) who painted the Anuradhapura Dagaba “altars” were capable of designing, and carrying out, the life-like frescoes of Sigiriya. Moreover, as is well known, Oriental art is strongly conservative—follows slavishly stereo-

typed forms and methods. Is it probable—is it even possible—that the art of fresco painting should, among the Sinhalese, have risen to the high level of Sigiriya in the fifth century, and gradually degenerate into the travesty which offends the eye and excites ridicule, at the modern Buddhist temples of Ceylon?

(VI.) “Kasyapa was a prisoner king. Betaking himself to the rock-fortress of Sigiriya, he lay for eighteen long years in concealment, fearful of the vengeance of his brother Moggalana, from which he only escaped by the crime of suicide. It is difficult to understand the opportunities which this prisoner-king would have had to communicate with India, and to import therefrom exotic artists.”

“Prisoner-king”—presumably a sort of “ticket-of-leave” Prince; allowed by the considerateness of a younger brother to have for only “eighteen long years,” the run of the Island, provided he kept in decent “concealment.” To Kasyapa’s credit, be it said, he behaved exceedingly well during his period of “probation”—he committed no more murders—he did not worry Moggalana (who by the way appears to have found it “convenient” to cross over to India, so as not to embarrass his elder brother in the least)—he merely amused himself by erecting, at vast labour and expense, a magnificent royal citadel,—just to show what “honest concealment” meant,” of course, under such conditions, intercourse with India would be quite impossible.

(VII.) “The presumption of exotic artists would imply that painting was the only art in which the ancient Sinhalese were lacking, great as they admittedly were in sculpture, architecture, engineering, &c.”

This opens up a far wider question; and one that must not be “begged.” Is Mr. Fernando prepared to prove that the *Sinhalese* were “great” in “sculpture, architecture, &c.”? Will he favour the Asiatic Society with a paper on:—“The characteristics of the *Sinhalese* style of ancient architecture, as distinct from the Buddhistic and Dravidian styles found in India”? I do not say the task is impossible; but it is not to be undertaken hastily. At present there is much ground for the supposition that the Sinhalese kings imported skilled artisans from the continent to execute very many of the ancient monuments of Anuradhapura, Polonnaruwa, &c., commonly attributed to the Sinhalese. Few are the forms of building and sculpture which cannot be easily traced to an Indian source.—Yours faithfully, H. C. P. BELL.

Anuradhapura, Jan. 22.

A Portuguese Church in Batavia.

INTERESTING NOTES OF DAYS OF OLD—200 YEARS AGO:

PORTUGUESE vs. DUTCH IN THE EAST.

MIT OUD-BATAVIA DE PORTUGESISCHE BUITEN KERK: (G. Kolff & Co., Batavia.)

The above is the title of a little book, written by Dr. F. de Haar, published, as the title page indicates for the benefit of the fund for the restoration of the Church.

As the name (*Buiten kerk*), indicates, the church stands *outside the ouden wal* (the old rampart) and, according to the writer, is fully worth a visit. “You enter through a gate, the church yard, surrounded, as ‘at home,’ with a wall. A paved way leads one, past tombs covered with tombstones, to the chief entrance. You enter, to leave behind you, India and all that is, and will remain strange to you. You are on your native land.”

“... Those seats along the wall, they are the same where you have often sat as a child. These seats in the nave of the church, many a Sunday have you seen well known faces, singing there, out of the psalm book. Your eyes fall on the many coloured hatchments on the wall, and one which records the date of the building, 1695.

The *buiten kerk* was not built for those high in station and office, but for the labouring classes, and the services in Dutch, or even in Malay, were the exception. Portuguese was the language used. When the Dutch conquered their mortal enemy, the Portuguese had long been settled in the East. They knew more than any other nation how to adapt themselves to the conditions of Eastern life. They brought none of their women to the East, hence the race of what our fathers called "mixtisen" in the Portuguese Colonies. The teaching of the Jesuit fathers swelled the ranks of "black Portuguese" and out of the Babel of tongues heard in Batavia, there arose a bastard Portuguese, a *lingua franca*. At first services took place in the fort, a little church was built which was burnt down during the siege (1623). Services were then held in the *gemeene wandadplaatse* (ordinary promenade) of the *stad hins*. In 1634 Dr. Molinens began to preach in Portuguese. A class of "swarte borgeren" or Mardy'ken also arose speaking Portuguese, and the language had taken such a strong hold on the people, that in the year (1611) when Malacca was taken, the Government expressed the fear "that Portuguese would eventually sweep out the Dutch language" and resolved to take measures to prevent such a result. It passed a rule that officers of the Mardy'ken Companies should be able to speak Dutch. But with little success, as in 1674 Mantzinker, the Governor-General, wrote that the "Portuguese language had the Upperhand" to his great regret. Not only did slaves and freed people speak it, but it was the home language of the Europeans. The Portuguese congregation knew so little Dutch in 1713, that only 3 out of 100 understood it. Measures were then taken to spread the Reformed Religion. A Bandanese, Cornelis Seenen (commonly known as Meester Cornelis) was thirty year "voorlezer."

He was "a local celebrity," still remembered when many Governors-General are forgotten. Unfortunately, through lack of intelligence, he could not attain the rank of *predikant*, which the Government would have gladly granted to him. *Meester Cornelis tuyn* (Master Cornelis' garden) still commemorates his memory. In 1651 the Government resolved to build a masonry church for the native Chinese. The place selected was where, in the time of Governor Coen, the English had their quarters. The foundation stone was not laid till the 1st Jan. 1673. This church was used by the Malay and Portuguese congregations, but latterly, exclusively, by the Portuguese and was known as the Portuguese *Binnenkerk* (the church within the walls). This church was burnt down on the 14th Jan. 1808. Many Asiatics and freedmen from Ceylon came to Batavia and increased the Portuguese congregations. These people are described as "conforming to the manner of the Nederlanders" and it was said of them (1705) "that they went about with the ridiculous haughty air of the Portuguese, clad like Europeans, but mostly without shirt, socks or shoes, with an antique and tattered coat with their coal black faces and feet, looking like a mountebank's ape 'rigged out' in his finery." The Batavian mardykers, who had served the hon. Company well in their wars, settled outside the city walls close to the bastion *gelbria*. There was already (1669) a cemetery for them here, and there was built of bamboo a church where the Portuguese were catechized. In consequence of the increasing numbers of those who came to be catechized Governor-General Camphujs (1689) resolved to buy the "garden of Gerbrandt Nieholt," to enlarge the cemetery and obtain a site for a larger church. On the 19th October, 1693 the first stone was laid "in the presence of the Director-General Joan Van Hoorn, by his nephew the Visitor-General Pieter Van Hoorn." It was the intention of the Government that the Portuguese should provide the funds for the building, but this was found impracticable. The church funds of Formosa were sent to Batavia, after Fort Zelandia was taken by Coxinga, the native chief. Part of this fund was used to provide for the French refugees to the Cape of Good Hope, and the balance 3,000 rix dollars were used

for buying the building materials of the *Buiten Kerk*. On the 23rd October, 1695 the church was formally thrown open for public worship. The Rev. Theodorus Zas, an aged man with "a ferocious moustache" dating 30 years back to the time when he preached in the fleet to those who took part in the blockade of Goa, preached the first sermon taking as his text 1 Kings VIII 29 and 30, in the presence of the Governor-General and others. In the afternoon Rev Jacobus Opden Acker preached in Portuguese. This is the history of the building of the *Buiten Kerk*.

Hers follows a description of the church (two views of the inside being given):—"Of the six frames within each window-frame, at that time four were of rattan lath-work and only two of the upper ones had panes. This was found to be more airy. Here and there, there were coloured panes. The gallery was supported by three turned pillars which now support the sounding board (organ). The rail of the gallery was in the same style. Chandeliers were used for lighting. The roof was supported by six wooden columns. The present stone pillars appear to date from 1725. It is a question whether the present quaint pulpit is the same as that supplied by Hendrik Bruyn for 260 rix dollars in the year 1695, or whether the two newly-made *heerebanken*, with carved work, have not been since replaced." The native burgher, Sergeant Anthoni Colle, a brave Mardyker, presented 300 rix dollars to the church. A silver plate to his memory dates from 1635.

As regards the organ, in 1782, the daughter of the wealthy minister, Johan Maartz Mohr, of the Portuguese congregation, presented to the church a new one, in memory of her father. The old fashioned chair in the nave of the church is apparently the same that was presented by the Governor-General Vander Parra. The old Portuguese Testament and Malay-Psalms book with silver locks, the four salvers and jugs of silver presented by Camphuys are not to be seen now. Also the two silver fonts gifted by the native Captain Anthony Adriaansz, or the two cups of Sinjeur Joan Rodrigo (perhaps some of this is in the Willems Kerk).

On the walls are various hatchments with Coats of Arms of long-forgotten ladies and gentlemen, herces of the age of periwigs, of no interest to the present generation save that of Hendrik Swaardekroon (at one time Commander of Jafina); many hatchments of Governor-General removed to the *Binnen Kerk* were destroyed by a fire in 1808.

In getting out of the church, to the left of the entrance there is the tomb of Zwaardkroon and those of other "notabilities." He wished to be buried with the "commonalty," among whom we find the tombs of Frederik Riehalt (Mardyker) Titus Anthonysson and his "good" wife Ragel Titise.

Since then those buried here were Company's servants who died in the hospital:—

"Perhaps in this neglected spot is laid
Some heart, once pregnant with celestial fire—
Hands that the rod of empire might have swayed."
Here follows a description from *Heydt* (Schouwplaats). About the year 1800 burials ceased here, "and now a quiet kitchen garden has been started within the walls in this wretched quarter." The Portuguese services were afterwards less and less attended, collections fell off "and the time came when one was glad to find a clergyman who could speak Portuguese, although it was 'high' Portuguese, not understood by the congregation." Abraham Antony Engelbrecht baptized in Galle on the 6th May, 1759, and who died in Batavia 23rd September, 1808 was the last *Predikant* to the Portuguese. *Sic transit*.

Some historical notes are appended and an extract from the Dagregister of the Fort of Batavia 16th August, 1728, describing the funeral of Zwaardkroon, whose coat of arms is described as:—

"Azur a sword points upwards hilted gold, the end broken. Issuing from the helmet a raised hand holding a green wreath."

The above is a summary of the contents of this very interesting little book.—F. H. de V.
